## Introduction

Atmel® | SMART™ SAM D20 is a series of low-power microcontrollers using the 32-bit ARM® Cortex®-M0+ processor, and ranging from 32- to 64-pins with up to 256KB Flash and 32KB of SRAM. The SAM D20 devices operate at a maximum frequency of 48MHz and reach 2.46 CoreMark®/MHz. They are designed for simple and intuitive migration with identical peripheral modules, hex compatible code, identical linear address map and pin compatible migration paths between all devices in the product series. All devices include intelligent and flexible peripherals, Atmel Event System for inter-peripheral signaling, and support for capacitive touch button, slider and wheel user interfaces.

## Features

- Processor
  - ARM Cortex-M0+ CPU running at up to 48MHz
    - Single-cycle hardware multiplier
- Memories
  - 16/32/64/128/256KB in-system self-programmable Flash
  - 2/4/8/16/32KB SRAM Memory
- System
  - Power-on reset (POR) and brown-out detection (BOD)
  - Internal and external clock options with 48MHz Digital Frequency Locked Loop (DFLL48M)
  - External Interrupt Controller (EIC)
  - 16 external interrupts
  - One non-maskable interrupt
  - Two-pin Serial Wire Debug (SWD) programming, test and debugging interface
- Low Power
  - Idle and standby sleep modes
  - SleepWalking peripherals
- Peripherals
  - 8-channel Event System

- Up to five 16-bit Timer/Counters (TC), configurable as either:
  - One 16-bit TC with two compare/capture channels
  - One 8-bit TC with two compare/capture channels
  - One 32-bit TC with two compare/capture channels, by using two TCs
- 32-bit Real Time Counter (RTC) with clock/calendar function
- Watchdog Timer (WDT)
- CRC-32 generator
- Up to six Serial Communication Interfaces (SERCOM), each configurable to operate as either:
  - USART with full-duplex and single-wire half-duplex configuration
  - Inter-Integrated Circuit (I<sup>2</sup>C) up to 400kHz
  - Serial Peripheral Interface (SPI)
- One 12-bit, 350ksps Analog-to-Digital Converter (ADC) with up to 20 channels
  - Differential and single-ended input
  - 1/2x to 16x programmable gain stage
  - Automatic offset and gain error compensation
  - Oversampling and decimation in hardware to support 13-, 14-, 15- or 16-bit resolution
- 10-bit, 350ksps Digital-to-Analog Converter (DAC)
- Two Analog Comparators (AC) with window compare function
- Peripheral Touch Controller (PTC)
  - 256-Channel capacitive touch and proximity sensing
- I/O
  - Up to 52 programmable I/O pins
- Packages
  - 64-pin TQFP, QFN
  - 64-ball UFBGA
  - 48-pin TQFP, QFN
  - 45-ball WLCSP
  - 32-pin TQFP, QFN
- Operating Voltage
  - 1.62V – 3.63V
- Power Consumption
  - Down to 70µA/MHz in active mode
  - Down to 8µA running the Peripheral Touch Controller

## 1. Description

The Atmel® | SMART™ SAM D20 is a series of low-power microcontrollers using the 32-bit ARM® Cortex®-M0+ processor, and ranging from 32- to 64-pins with up to 256KB Flash and 32KB of SRAM. The SAM D20 devices operate at a maximum frequency of 48MHz and reach 2.46 CoreMark/MHz. They are designed for simple and intuitive migration with identical peripheral modules, hex compatible code, identical linear address map and pin compatible migration paths between all devices in the product series. All devices include intelligent and flexible peripherals, Atmel Event System for inter-peripheral signaling, and support for capacitive touch button, slider and wheel user interfaces.

The SAM D20 devices provide the following features: In-system programmable Flash, eight-channel Event System, programmable interrupt controller, up to 52 programmable I/O pins, 32-bit real-time clock and calendar, up to eight 16-bit Timer/Counters (TC). The timer/counters can be configured to perform frequency and waveform generation, accurate program execution timing or input capture with time and frequency measurement of digital signals. The TCs can operate in 8- or 16-bit mode, selected TCs can be cascaded to form a 32-bit TC. The series provide up to six Serial Communication Modules (SERCOM) that each can be configured to act as an USART, UART, SPI, I<sup>2</sup>C up to 400kHz, up to twenty-channel 350ksps 12-bit ADC with programmable gain and optional oversampling and decimation supporting up to 16-bit resolution, one 10-bit 350ksps DAC, two analog comparators with window mode, Peripheral Touch Controller supporting up to 256 buttons, sliders, wheels and proximity sensing; programmable Watchdog Timer, brown-out detector and power-on reset and two-pin Serial Wire Debug (SWD) program and debug interface.

All devices have accurate and low-power external and internal oscillators. All oscillators can be used as a source for the system clock. Different clock domains can be independently configured to run at different frequencies, enabling power saving by running each peripheral at its optimal clock frequency, and thus maintaining a high CPU frequency while reducing power consumption.

The SAM D20 devices have two software-selectable sleep modes, idle and standby. In idle mode the CPU is stopped while all other functions can be kept running. In standby all clocks and functions are stopped expect those selected to continue running. The device supports SleepWalking. This feature allows the peripheral to wake up from sleep based on predefined conditions, and thus allows the CPU to wake up only when needed, e.g. when a threshold is crossed or a result is ready. The Event System supports synchronous and asynchronous events, allowing peripherals to receive, react to and send events even in standby mode.

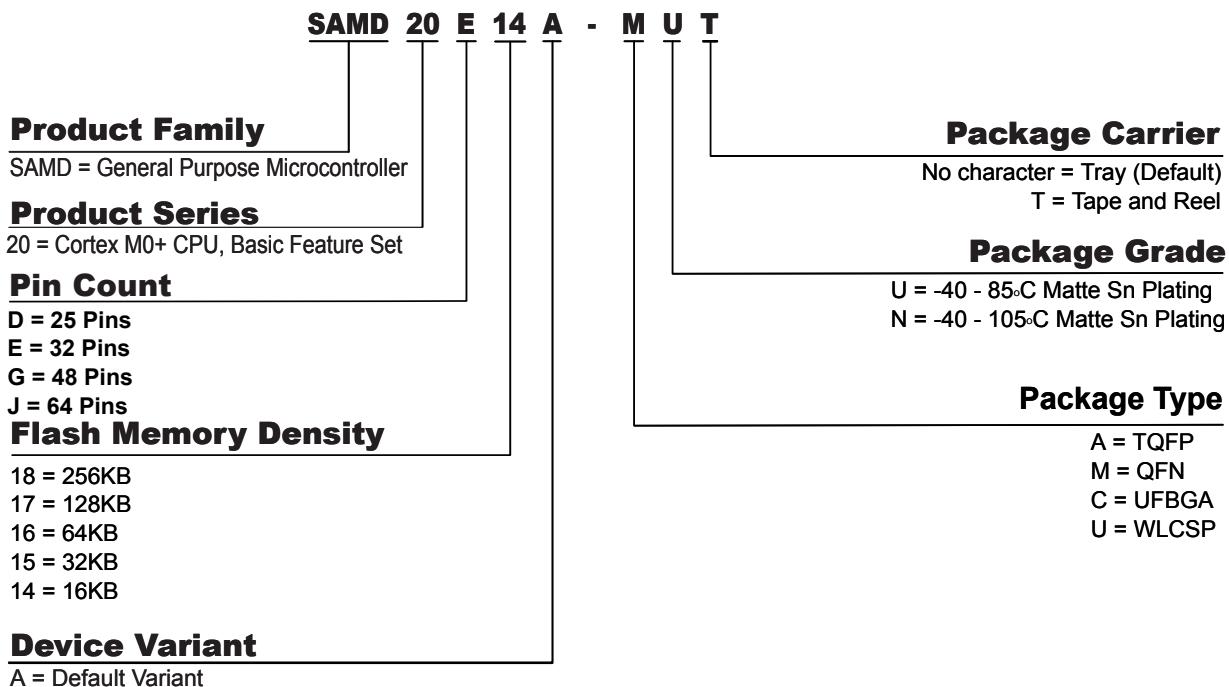

The Flash program memory can be reprogrammed in-system through the SWD interface. The same interface can be used for non-intrusive on-chip debug of application code. A boot loader running in the device can use any communication interface to download and upgrade the application program in the Flash memory.

The SAM D20 devices are supported with a full suite of program and system development tools, including C compilers, macro assemblers, program debugger/simulators, programmers and evaluation kits.

## 2. Configuration Summary

	<b>SAM D20J</b>	<b>SAM D20G</b>	<b>SAM D20E</b>
Pins	64	48	32
General Purpose I/O-pins (GPIOs)	52	38	26

### 3.4. Device Identification

The DSU - Device Service Unit peripheral provides the Device Selection bits in the Device Identification register (DID.DEVSEL) in order to identify the device by software. The device variants have a reset value of DID=0x1001drxx, with the LSB identifying the die number ('d'), the die revision ('r') and the device selection ('xx').

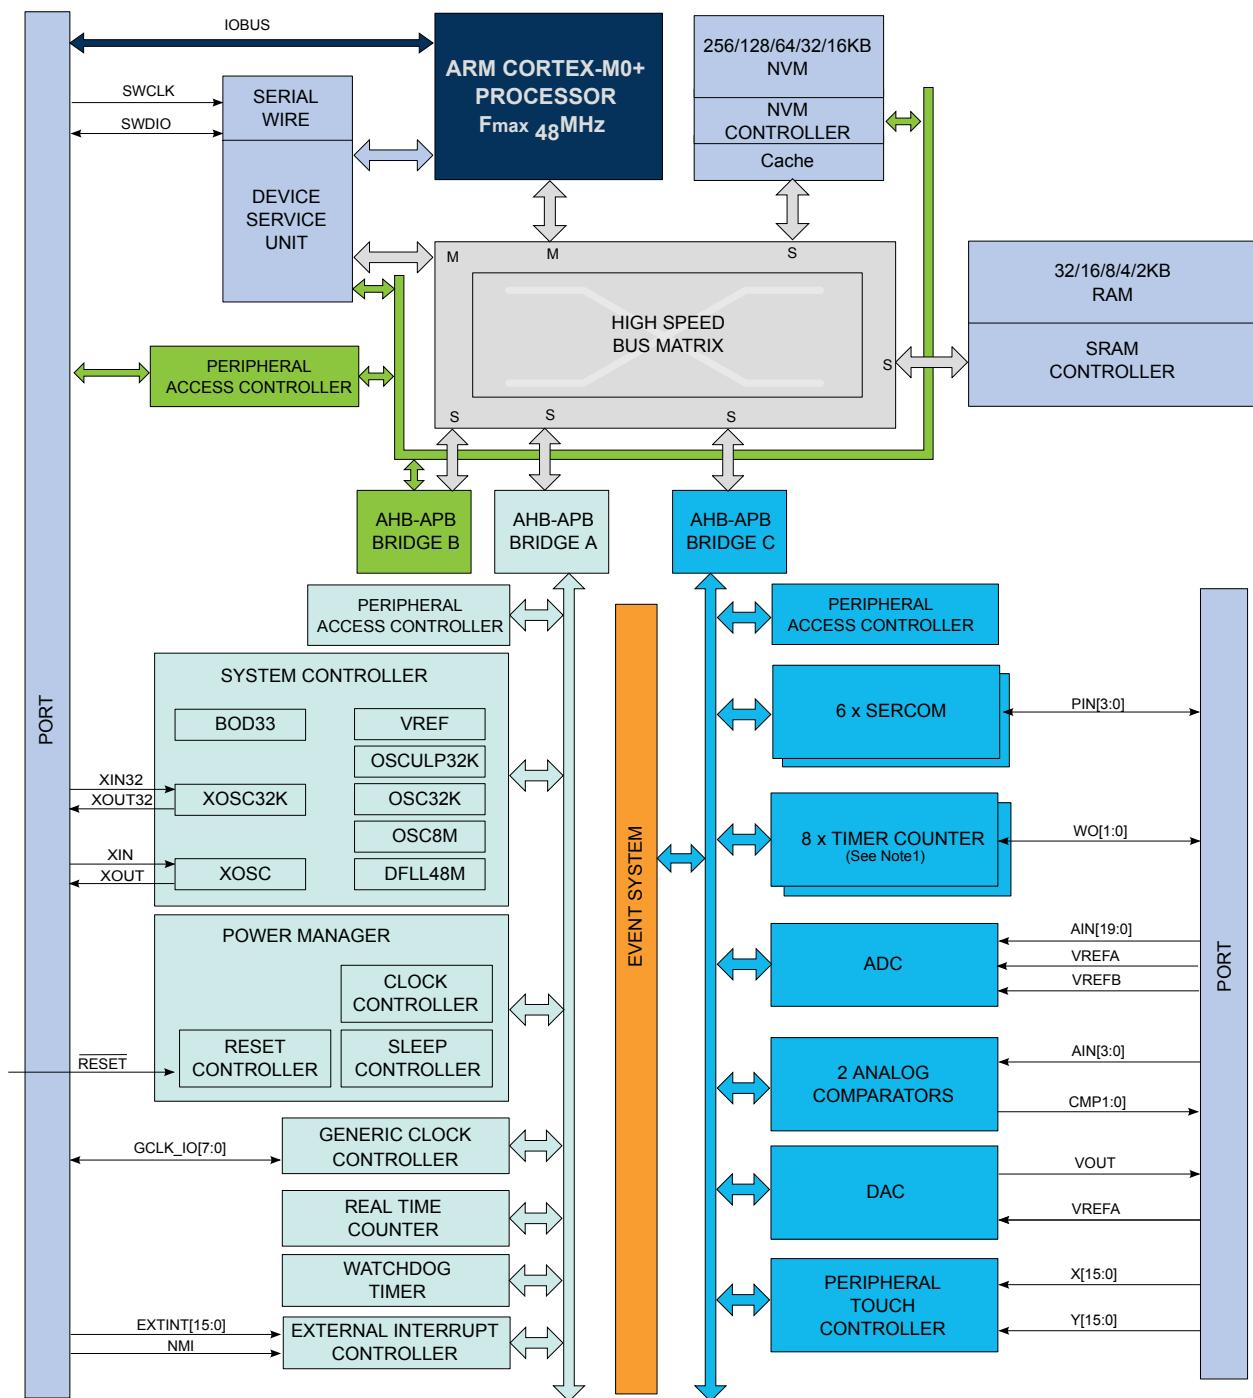

**Table 3-1. Device Identification Values**

Device Variant	DID.DEVSEL	Device ID (DID)
SAMD20J18C	0x00	0x10001300
SAMD20J18A	0x00	0x10001300
SAMD20J17A	0x01	0x10001301
SAMD20J16A	0x02	0x10001302
SAMD20J15A	0x03	0x10001303
SAMD20J14A	0x04	0x10001304
SAMD20G18A	0x05	0x10001305
SAMD20G17A	0x06	0x10001306
SAMD20G16A	0x07	0x10001307
SAMD20G15A	0x08	0x10001308
SAMD20G14A	0x09	0x10001309
SAMD20E18A	0x0A	0x1000130A
SAMD20E17A	0x0B	0x1000130B
SAMD20E16A	0x0C	0x1000130C
SAMD20E15A	0x0D	0x1000130D

Device Variant	DID.DEVSEL	Device ID (DID)
SAMD20E14A	0x0E	0x1000130E
Reserved	0x0F	
SAMD20G18U	0x10	0x10001310
SAMD20G17U	0x11	0x10001311
Reserved	0x12 - 0xFF	

**Note:** The device variant (last letter of the ordering number) is independent of the die revision (DSU.DID.REVISION): The device variant denotes functional differences, whereas the die revision marks evolution of the die. The device variant denotes functional differences, whereas the die revision marks evolution of the die.

## 4. Block Diagram

**Note:** 1. Some products have different number of SERCOM instances, Timer/Counter instances, PTC signals and ADC signals. Refer to *Peripherals Configuration Summary* for details.

## 6. Signal Descriptions List

The following table gives details on signal names classified by peripheral.

Signal Name	Function	Type	Active Level
Analog Comparators - AC			
AIN[3:0]	AC Analog Inputs	Analog	
CMP[1:0]	AC Comparator Outputs	Digital	
Analog Digital Converter - ADC			
AIN[19:0]	ADC Analog Inputs	Analog	
VREFA	ADC Voltage External Reference A	Analog	
VREFB	ADC Voltage External Reference B	Analog	
Digital Analog Converter - DAC			
VOUT	DAC Voltage output	Analog	
VREFA	DAC Voltage External Reference	Analog	
External Interrupt Controller			
EXTINT[15:0]	External Interrupts	Input	
NMI	External Non-Maskable Interrupt	Input	
Generic Clock Generator - GCLK			
GCLK_IO[7:0]	Generic Clock (source clock or generic clock generator output)	I/O	
Power Manager - PM			
RESET	Reset	Input	Low
Serial Communication Interface - SERCOMx			
PAD[3:0]	SERCOM I/O Pads	I/O	
System Control - SYSCTRL			
XIN	Crystal Input	Analog/ Digital	
XIN32	32kHz Crystal Input	Analog/ Digital	
XOUT	Crystal Output	Analog	
XOUT32	32kHz Crystal Output	Analog	
Timer Counter - TCx			
WO[1:0]	Waveform Outputs	Output	
Peripheral Touch Controller - PTC			
X[15:0]	PTC Input	Analog	
Y[15:0]	PTC Input	Analog	

Signal Name	Function	Type	Active Level
General Purpose I/O - PORT			
PA25 - PA00	Parallel I/O Controller I/O Port A	I/O	
PA28 - PA27	Parallel I/O Controller I/O Port A	I/O	
PA31 - PA30	Parallel I/O Controller I/O Port A	I/O	
PB17 - PB00	Parallel I/O Controller I/O Port B	I/O	
PB23 - PB22	Parallel I/O Controller I/O Port B	I/O	
PB31 - PB30	Parallel I/O Controller I/O Port B	I/O	

## 7. I/O Multiplexing and Considerations

### Related Links

[I2C Pins](#) on page 614

### 7.1. Multiplexed Signals

Each pin is by default controlled by the PORT as a general purpose I/O and alternatively it can be assigned to one of the peripheral functions A, B, C, D, E, F, G or H. To enable a peripheral function on a pin, the Peripheral Multiplexer Enable bit in the Pin Configuration register corresponding to that pin (PINCFGn.PMUXEN, n = 0-31) in the PORT must be written to one. The selection of peripheral function A to H is done by writing to the Peripheral Multiplexing Odd and Even bits in the Peripheral Multiplexing register (PMUXn.PMUXE/O) in the PORT.

This table describes the peripheral signals multiplexed to the PORT I/O pins.

**Table 7-1. PORT Function Multiplexing**

	48	64	PB03	VDDANA		EXTINT[3]		AIN[11]		Y[9]			SERCOM5/ PAD[1]	TC6/ WO[1]			

**Note:**

1. Use the SAMD20J pinout muxing for WLCSP45 package.
2. All analog pin functions are on peripheral function B. Peripheral function B must be selected to disable the digital control of the pin.
3. Only some pins can be used in SERCOM I<sup>2</sup>C mode. See the Type column for using a SERCOM pin in I<sup>2</sup>C mode. Refer to *Electrical Characteristics* for details on the I<sup>2</sup>C pin characteristics.
4. Note that TC6 and TC7 are not supported on the SAM D20E and SAM D20G devices. Refer to [Configuration Summary](#) for details.
5. This function is only activated in the presence of a debugger.
6. If the PA24 and PA25 pins are not connected, it is recommended to enable a pull-up on PA24 and PA25 through input GPIO mode. The aim is to avoid an eventually extract power consumption (<1mA) due to a not stable level on pad.

[Electrical Characteristics](#) on page 606

[I<sup>2</sup>C Pins](#) on page 614

## 7.2. Other Functions

### 7.2.1. Oscillator Pinout

The oscillators are not mapped to the normal PORT functions and their multiplexing are controlled by registers in the System Controller (SYSCTRL).

**Table 7-2. Oscillator Pinout**

Oscillator	Supply	Signal	I/O pin
XOSC	VDDIO	XIN	PA14
		XOUT	PA15
XOSC32K	VDDANA	XIN32	PA00
		XOUT32	PA01

**Related Links**

[SYSCTRL – System Controller](#) on page 162

### 7.2.2. Serial Wire Debug Interface Pinout

Only the SWCLK pin is mapped to the normal PORT functions. A debugger cold-plugging or hot-plugging detection will automatically switch the SWDIO port to the SWDIO function.

**Table 7-3. Serial Wire Debug Interface Pinout**

Signal	Supply	I/O pin
SWCLK	VDDIO	PA30
SWDIO	VDDIO	PA31

## 8. Power Supply and Start-Up Considerations

### Related Links

[Supply Characteristics](#) on page 607

### 8.1. Power Domain Overview

### 8.2. Power Supply Considerations

#### 8.2.1. Power Supplies

The device has several different power supply pins:

- VDDIO: Powers I/O lines, OSC8M and XOSC. Voltage is 1.62V to 3.63V.
- VDDIN: Powers I/O lines and the internal regulator. Voltage is 1.62V to 3.63V.
- VDDANA: Powers I/O lines and the ADC, AC, DAC, PTC, OSCULP32K, OSC32K, XOSC32K. Voltage is 1.62V to 3.63V.
- VDDCORE: Internal regulated voltage output. Powers the core, memories, peripherals, and DFLL48M. Voltage is 1.2V.

The same voltage must be applied to both VDDIN, VDDIO and VDDANA. This common voltage is referred to as  $V_{DD}$  in the datasheet.

The ground pins, GND, are common to VDDCORE, VDDIO and VDDIN. The ground pin for VDDANA is GNDANA.

For decoupling recommendations for the different power supplies. Refer to *Schematic Checklist* for details.

#### Related Links

[Schematic Checklist](#) on page 652

### 8.2.2. Voltage Regulator

The voltage regulator has two different modes:

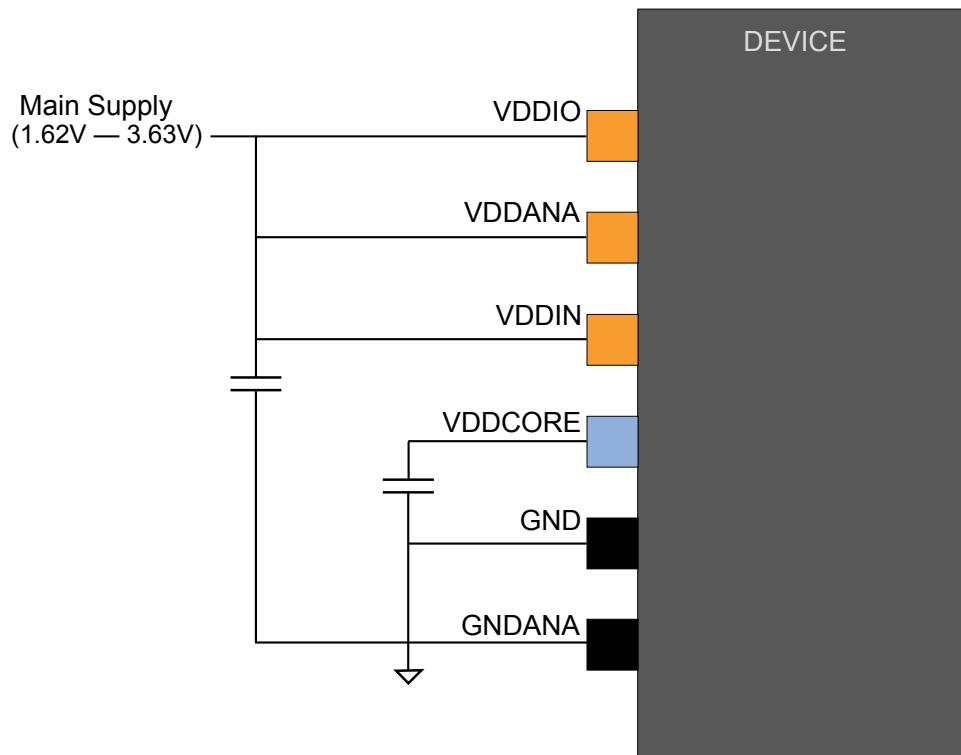

- Normal mode: To be used when the CPU and peripherals are running
- Low Power (LP) mode: To be used when the regulator draws small static current. It can be used in standby mode

### 8.2.3. Typical Powering Schematics

The device uses a single main supply with a range of 1.62V - 3.63V.

The following figure shows the recommended power supply connection.

**Figure 8-1. Power Supply Connection**

### 8.2.4. Power-Up Sequence

#### 8.2.4.1. Minimum Rise Rate

The integrated power-on reset (POR) circuitry monitoring the VDDANA power supply requires a minimum rise rate. Refer to the *Electrical Characteristics* for details.

#### Related Links

[Electrical Characteristics](#) on page 606

#### **8.2.4.2. Maximum Rise Rate**

The rise rate of the power supply must not exceed the values described in Electrical Characteristics. Refer to the *Electrical Characteristics* for details.

##### **Related Links**

[Electrical Characteristics](#) on page 606

### **8.3. Power-Up**

This section summarizes the power-up sequence of the device. The behavior after power-up is controlled by the Power Manager. Refer to *PM – Power Manager* for details.

##### **Related Links**

[PM – Power Manager](#) on page 129

#### **8.3.1. Starting of Clocks**

After power-up, the device is set to its initial state and kept in reset, until the power has stabilized throughout the device. Once the power has stabilized, the device will use a 1MHz clock. This clock is derived from the 8MHz Internal Oscillator (OSC8M), which is divided by eight and used as a clock source for generic clock generator 0. Generic clock generator 0 is the main clock for the Power Manager (PM).

Some synchronous system clocks are active, allowing software execution.

Refer to the “Clock Mask Register” section in *PM – Power Manager* for the list of default peripheral clocks running. Synchronous system clocks that are running are by default not divided and receive a 1MHz clock through generic clock generator 0. Other generic clocks are disabled except GCLK\_WDT, which is used by the Watchdog Timer (WDT).

##### **Related Links**

[PM – Power Manager](#) on page 129

#### **8.3.2. I/O Pins**

After power-up, the I/O pins are tri-stated.

#### **8.3.3. Fetching of Initial Instructions**

After reset has been released, the CPU starts fetching PC and SP values from the reset address, which is 0x00000000. This address points to the first executable address in the internal flash. The code read from the internal flash is free to configure the clock system and clock sources. Refer to *PM – Power Manager*, *GCLK – Generic Clock Controller* and *SYSCTRL – System Controller* for details. Refer to the ARM Architecture Reference Manual for more information on CPU startup (<http://www.arm.com>).

##### **Related Links**

[PM – Power Manager](#) on page 129

[SYSCTRL – System Controller](#) on page 162

[GCLK - Generic Clock Controller](#) on page 108

[PM – Power Manager](#) on page 129

### **8.4. Power-On Reset and Brown-Out Detector**

The SAM D20 embeds three features to monitor, warn and/or reset the device:

- POR: Power-on reset on VDDANA

- BOD33: Brown-out detector on VDDANA
- BOD12: Voltage Regulator Internal Brown-out detector on VDDCORE. The Voltage Regulator Internal BOD is calibrated in production and its calibration configuration is stored in the NVM User Row. This configuration should not be changed if the user row is written to assure the correct behavior of the BOD12.

#### **8.4.1. Power-On Reset on VDDANA**

POR monitors VDDANA. It is always activated and monitors voltage at startup and also during all the sleep modes. If VDDANA goes below the threshold voltage, the entire chip is reset.

#### **8.4.2. Brown-Out Detector on VDDANA**

BOD33 monitors VDDANA. Refer to *SYSCTRL – System Controller* for details.

##### **Related Links**

[SYSCTRL – System Controller](#) on page 162

#### **8.4.3. Brown-Out Detector on VDDCORE**

Once the device has started up, BOD12 monitors the internal VDDCORE.

## 9. Product Mapping

Figure 9-1. Product Mapping

This figure represents the full configuration of the SAM D20 device with maximum flash and SRAM capabilities and a full set of peripherals. Refer to the [Configuration Summary](#) for details.

## 10. Memories

### 10.1. Embedded Memories

- Internal high-speed flash
- Internal high-speed RAM, single-cycle access at full speed
- Dedicated flash area for EEPROM emulation

### 10.2. Physical Memory Map

The High-Speed bus is implemented as a bus matrix. All High-Speed bus addresses are fixed, and they are never remapped in any way, even during boot. The 32-bit physical address space is mapped as follow:

Table 10-1. Physical Memory Map

Memory	Start address	Size (Kbytes)				
		SAMD20x18	SAMD20x17	SAMD20x16	SAMD20x15	SAMD20x14
Internal Flash	0x00000000	256	128	64	32	16
Internal SRAM	0x20000000	32	16	8	4	2
Peripheral Bridge A	0x40000000	64	64	64	64	64
Peripheral Bridge B	0x41000000	64	64	64	64	64
Peripheral Bridge C	0x42000000	64	64	64	64	64

1. x = G, J or E. Refer to [Ordering Information](#)

Table 10-2. Flash memory parameters

Device	Flash size	Number of pages	Page size	Row Size
SAMD20x18	256Kbytes	4096	64 bytes	4 pages = 256 bytes
SAMD20x17	128Kbytes	2046	64 bytes	4 pages = 256 bytes
SAMD20x16	64Kbytes	1024	64 bytes	4 pages = 256 bytes
SAMD20x15	32Kbytes	512	64 bytes	4 pages = 256 bytes
SAMD20x14	16Kbytes	256	64 bytes	4 pages = 256 bytes

1. x = G, J or E. Refer to [Ordering Information](#)

2. The number of pages (NVMP) and page size (PSZ) can be read from the NVM Pages and Page Size bits in the NVM Parameter register in the NVMCTRL (PARAM.NVMP and PARAM.PSZ, respectively). Refer to *NVM Parameter (PARAM)* register for details.

### 10.3. NVM Calibration and Auxiliary Space

The device calibration data are stored in different sections of the NVM calibration and auxiliary space presented in the following figure.

**Figure 10-1. Calibration and Auxiliary Space**

The values from the automatic calibration row are loaded into their respective registers at startup.

### 10.4. NVM User Row Mapping

The NVM User Row contains calibration data that are automatically read at device power on.

The NVM User Row can be read at address 0x804000.

To write the NVM User Row refer to *NVMCTRL – Non-Volatile Memory Controller*.

Note that when writing to the user row the values do not get loaded by the other modules on the device until a device reset occurs.

**Table 10-3. NVM User Row Mapping**

Bit Position	Name	Usage
2:0	BOOTPROT	Used to select one of eight different bootloader sizes. Refer to <i>NVMCTRL – Non-Volatile Memory Controller</i> . Default value = 0x7 except for WLCSP that has default value = 0x3 .
3	Reserved	
6:4	EEPROM	Used to select one of eight different EEPROM sizes. Refer to <i>NVMCTRL – Non-Volatile Memory Controller</i> . Default value = 7.
7	Reserved	
13:8	BOD33 Level	BOD33 Threshold Level at power on. Refer to <i>SYSCTRL BOD33 register</i> . Default value = 7.
14	BOD33 Enable	BOD33 Enable at power on . Refer to <i>SYSCTRL BOD33 register</i> . Default value = 1.

Bit Position	Name	Usage
16:15	BOD33 Action	BOD33 Action at power on. Refer to <i>SYSCTRL BOD33 register</i> . Default value = 1.
24:17	Reserved	Voltage Regulator Internal BOD (BOD12) configuration. These bits are written in production and must not be changed. Default value = 0x70.
25	WDT Enable	WDT Enable at power on. Refer to <i>WDT CTRL register</i> . Default value = 0.
26	WDT Always-On	WDT Always-On at power on. Refer to <i>WDT CTRL register</i> . Default value = 0.
30:27	WDT Period	WDT Period at power on. Refer to <i>WDT CONFIG register</i> . Default value = 0x0B.
34:31	WDT Window	WDT Window mode time-out at power on. Refer to <i>WDT CONFIG register</i> . Default value = 0x05.
38:35	WDT EWOFFSET	WDT Early Warning Interrupt Time Offset at power on. Refer to <i>WDT EWCTRL register</i> . Default value = 0x0B.
39	WDT WEN	WDT Timer Window Mode Enable at power on. Refer to <i>WDT CTRL register</i> . Default value = 0.
40	BOD33 Hysteresis	BOD33 Hysteresis configuration at power on. Refer to <i>SYSCTRL BOD33 register</i> . Default value = 0.
41	Reserved	Voltage Regulator Internal BOD(BOD12) configuration. This bit is written in production and must not be changed. Default value = 0.
47:42	Reserved	
63:48	LOCK	NVM Region Lock Bits. Refer to <i>NVMCTRL – Non-Volatile Memory Controller</i> . Default value = 0xFFFF.

## 10.5. NVM Software Calibration Area Mapping

The NVM Software Calibration Area contains calibration data that are measured and written during production test. These calibration values should be read by the application software and written back to the corresponding register.

The NVM Software Calibration Area can be read at address 0x806020.

The NVM Software Calibration Area can not be written.

**Table 10-4. NVM Software Calibration Area Mapping**

Bit Position	Name	Description
2:0	Reserved	
14:3	Reserved	
26:15	Reserved	
34:27	ADC LINEARITY	ADC Linearity Calibration. Should be written to ADC CALIB register.
37:35	ADC BIASCAL	ADC Bias Calibration. Should be written to ADC CALIB register.
44:38	OSC32K CAL	OSC32KCalibration. Should be written to SYSCTRL OSC32K register.
57:45	Reserved	
63:58	DFLL48M COARSE CAL <sup>1)</sup>	DFLL48M Coarse calibration value, should be written to SYSCTRL DFLLVAL register.
73:64	DFLL48M fine CAL <sup>1)</sup>	DFLL48M Fine calibration value, should be written to SYSCTRL DFLLVAL register.
127:74	Reserved	

**Note:** 1. Not applicable for die rev. C and previous.

## 10.6. Serial Number

Each device has a unique 128-bit serial number which is a concatenation of four 32-bit words contained at the following addresses:

Word 0: 0x0080A00C

Word 1: 0x0080A040

Word 2: 0x0080A044

Word 3: 0x0080A048

The uniqueness of the serial number is guaranteed only when using all 128 bits.

## 11. Processor And Architecture

### 11.1. Cortex M0+ Processor

The SAM D20 implements the ARM® Cortex®-M0+ processor, based on the ARMv6 Architecture and Thumb®-2 ISA. The Cortex M0+ is 100% instruction set compatible with its predecessor, the Cortex-M0 core, and upward compatible to Cortex-M3 and M4 cores. The ARM Cortex-M0+ implemented is revision r0p1. For more information refer to <http://www.arm.com>.

#### 11.1.1. Cortex M0+ Configuration

Table 11-1. Cortex M0+ Configuration

Features	Configurable option	Device configuration
Interrupts	External interrupts 0-32	28
Data endianness	Little-endian or big-endian	Little-endian
SysTick timer	Present or absent	Present
Number of watchpoint comparators	0, 1, 2	2
Number of breakpoint comparators	0, 1, 2, 3, 4	4
Halting debug support	Present or absent	Present
Multiplier	Fast or small	Fast (single cycle)
Single-cycle I/O port	Present or absent	Present
Wake-up interrupt controller	Supported or not supported	Not supported
Vector Table Offset Register	Present or absent	Present
Unprivileged/Privileged support	Present or absent	Absent <sup>(1)</sup>
Memory Protection Unit	Not present or 8-region	Not present
Reset all registers	Present or absent	Absent
Instruction fetch width	16-bit only or mostly 32-bit	32-bit

**Note:**

1. All software run in privileged mode only.

The ARM Cortex-M0+ core has two bus interfaces:

- Single 32-bit AMBA-3 AHB-Lite system interface that provides connections to peripherals and all system memory, which includes flash and RAM.
- Single 32-bit I/O port bus interfacing to the PORT with 1-cycle loads and stores.

#### 11.1.2. Cortex-M0+ Peripherals

- System Control Space (SCS)
  - The processor provides debug through registers in the SCS. Refer to the Cortex-M0+ Technical Reference Manual for details ([www.arm.com](http://www.arm.com)).
- System Timer (SysTick)

- The System Timer is a 24-bit timer that extends the functionality of both the processor and the NVIC. Refer to the Cortex-M0+ Technical Reference Manual for details ([www.arm.com](http://www.arm.com)).
- Nested Vectored Interrupt Controller (NVIC)
  - External interrupt signals connect to the NVIC, and the NVIC prioritizes the interrupts. Software can set the priority of each interrupt. The NVIC and the Cortex-M0+ processor core are closely coupled, providing low latency interrupt processing and efficient processing of late arriving interrupts. Refer to [Nested Vector Interrupt Controller](#) and the Cortex-M0+ Technical Reference Manual for details ([www.arm.com](http://www.arm.com)).
- System Control Block (SCB)
  - The System Control Block provides system implementation information, and system control. This includes configuration, control, and reporting of the system exceptions. Refer to the Cortex-M0+ Devices Generic User Guide for details ([www.arm.com](http://www.arm.com)).

### 11.1.3. Cortex-M0+ Address Map

Table 11-2. Cortex-M0+ Address Map

Address	Peripheral
0xE000E000	System Control Space (SCS)
0xE000E010	System Timer (SysTick)
0xE000E100	Nested Vectored Interrupt Controller (NVIC)
0xE000ED00	System Control Block (SCB)

### 11.1.4. I/O Interface

#### 11.1.4.1. Overview

Because accesses to the AMBA® AHB-Lite™ and the single cycle I/O interface can be made concurrently, the Cortex-M0+ processor can fetch the next instructions while accessing the I/Os. This enables single cycle I/O accesses to be sustained for as long as needed. Refer to [CPU Local Bus](#) for more information.

#### Related Links

[CPU Local Bus](#) on page 323

#### 11.1.4.2. Description

Direct access to PORT registers.

## 11.2. Nested Vector Interrupt Controller

#### 11.2.1. Overview

The Nested Vectored Interrupt Controller (NVIC) in the SAM D20 supports 32 interrupt lines with four different priority levels. For more details, refer to the Cortex-M0+ Technical Reference Manual ([www.arm.com](http://www.arm.com)).

#### 11.2.2. Interrupt Line Mapping

Each of the 28 interrupt lines is connected to one peripheral instance, as shown in the table below. Each peripheral can have one or more interrupt flags, located in the peripheral's Interrupt Flag Status and Clear (INTFLAG) register. The interrupt flag is set when the interrupt condition occurs. Each interrupt in the peripheral can be individually enabled by writing a one to the corresponding bit in the peripheral's Interrupt Enable Set (INTENSET) register, and disabled by writing a one to the corresponding bit in the

peripheral's Interrupt Enable Clear (INTENCLR) register. An interrupt request is generated from the peripheral when the interrupt flag is set and the corresponding interrupt is enabled. The interrupt requests for one peripheral are ORed together on system level, generating one interrupt request for each peripheral. An interrupt request will set the corresponding interrupt pending bit in the NVIC interrupt pending registers (SETPEND/CLRPEND bits in ISPR/ICPR). For the NVIC to activate the interrupt, it must be enabled in the NVIC interrupt enable register (SETENA/CLRENA bits in ISER/ICER). The NVIC interrupt priority registers IPR0-IPR7 provide a priority field for each interrupt.

**Table 11-3. Interrupt Line Mapping**

Peripheral Source	NVIC Line
EIC NMI – External Interrupt Controller	NMI
PM – Power Manager	0
SYSCTRL – System Control	1
WDT – Watchdog Timer	2
RTC – Real Time Counter	3
EIC – External Interrupt Controller	4
NVMCTRL – Non-Volatile Memory Controller	5
EVSYS – Event System	6
SERCOM0 – Serial Communication Interface 0	7
SERCOM1 – Serial Communication Interface 1	8
SERCOM2 – Serial Communication Interface 2	9
SERCOM3 – Serial Communication Interface 3	10
SERCOM4 – Serial Communication Interface 4	11
SERCOM5 – Serial Communication Interface 5	12
TC0 – Timer Counter 0	13
TC1 – Timer Counter 1	14
TC2 – Timer Counter 2	15
TC3 – Timer Counter 3	16
TC4 – Timer Counter 4	17
TC5 – Timer Counter 5	18
TC6 – Timer Counter 6	19
TC7 – Timer Counter 7	20
ADC – Analog-to-Digital Converter	21
AC – Analog Comparator	22
DAC – Digital-to-Analog Converter	23
PTC – Peripheral Touch Controller	24

## 11.3. High-Speed Bus System

### 11.3.1. Features

High-Speed Bus Matrix has the following features:

- Symmetric crossbar bus switch implementation
- Allows concurrent accesses from different masters to different slaves
- 32-bit data bus
- Operation at a one-to-one clock frequency with the bus masters

### 11.3.2. Configuration

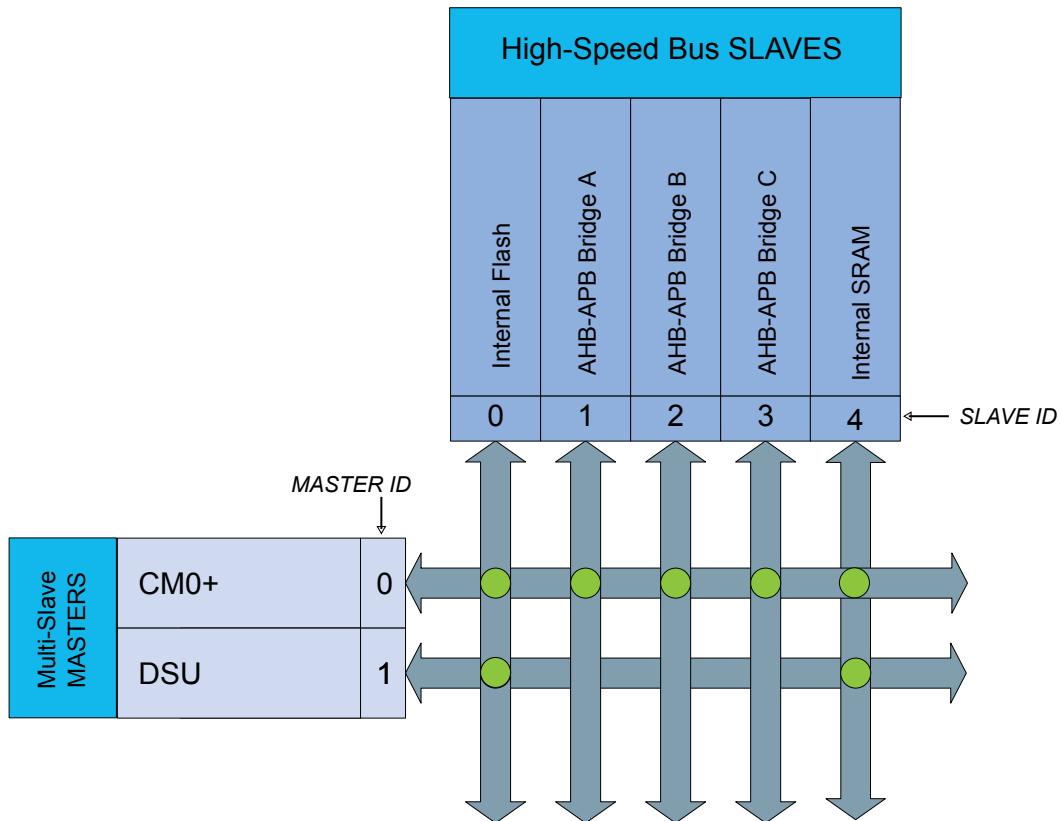

Table 11-4. Bus Matrix Masters

Bus Matrix Masters	Master ID
CM0+ - Cortex M0+ Processor	0
DSU - Device Service Unit	1

Table 11-5. Bus Matrix Slaves

Bus Matrix Slaves	Slave ID
Internal Flash Memory	0
AHB-APB Bridge A	1
AHB-APB Bridge B	2

Bus Matrix Slaves	Slave ID
AHB-APB Bridge C	3
Internal SRAM	4

## 11.4. AHB-APB Bridge

The AHB-APB bridge is an AHB slave, providing an interface between the high-speed AHB domain and the low-power APB domain. It is used to provide access to the programmable control registers of peripherals (see *Product Mapping*).

AHB-APB bridge is based on AMBA APB Protocol Specification V2.0 (ref. as APB4) including:

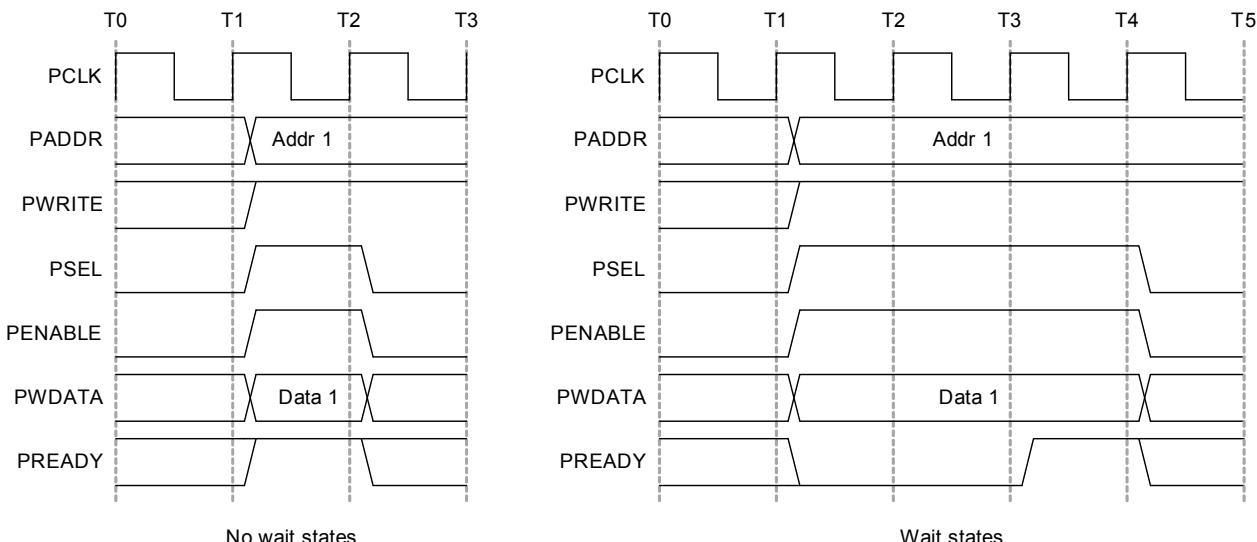

- Wait state support
- Error reporting
- Transaction protection
- Sparse data transfer (byte, half-word and word)

Additional enhancements:

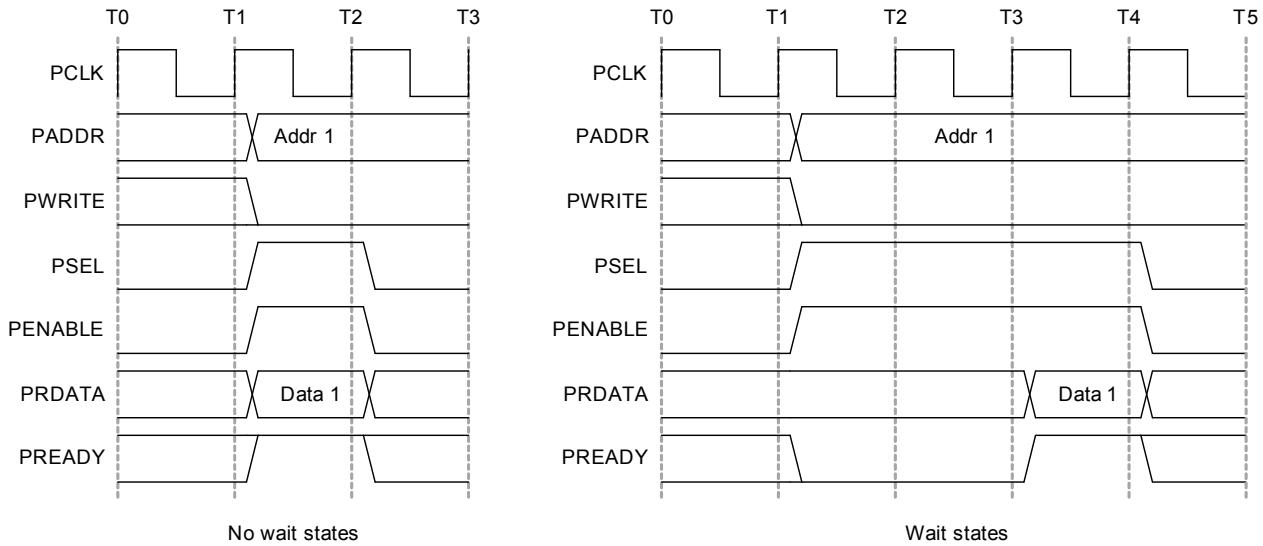

- Address and data cycles merged into a single cycle
- Sparse data transfer also apply to read access

to operate the AHB-APB bridge, the clock (CLK\_HPBx\_AHB) must be enabled. See *PM – Power Manager* for details.

**Figure 11-1. APB Write Access.**

**Figure 11-2. APB Read Access.**

## 11.5. PAC - Peripheral Access Controller

### 11.5.1. Overview

There is one PAC associated with each AHB-APB bridge. The PAC can provide write protection for registers of each peripheral connected on the same bridge.

The PAC peripheral bus clock (CLK\_PACx\_APB) can be enabled and disabled in the Power Manager. CLK\_PAC0\_APB and CLK\_PAC1\_APB are enabled at reset. CLK\_PAC2\_APB is disabled at reset. Refer to *PM – Power Manager* for details. The PAC will continue to operate in any sleep mode where the selected clock source is running. Write-protection does not apply for debugger access. When the debugger makes an access to a peripheral, write-protection is ignored so that the debugger can update the register.

Write-protect registers allow the user to disable a selected peripheral's write-protection without doing a read-modify-write operation. These registers are mapped into two I/O memory locations, one for clearing and one for setting the register bits. Writing a one to a bit in the Write Protect Clear register (WPCLR) will clear the corresponding bit in both registers (WPCLR and WPSET) and disable the write-protection for the corresponding peripheral, while writing a one to a bit in the Write Protect Set (WPSET) register will set the corresponding bit in both registers (WPCLR and WPSET) and enable the write-protection for the corresponding peripheral. Both registers (WPCLR and WPSET) will return the same value when read.

If a peripheral is write-protected, and if a write access is performed, data will not be written, and the peripheral will return an access error (CPU exception).

The PAC also offers a safety feature for correct program execution, with a CPU exception generated on double write-protection or double unprotection of a peripheral. If a peripheral n is write-protected and a write to one in WPSET[n] is detected, the PAC returns an error. This can be used to ensure that the application follows the intended program flow by always following a write-protect with an unprotect, and vice versa. However, in applications where a write-protected peripheral is used in several contexts, e.g., interrupts, care should be taken so that either the interrupt can not happen while the main application or

other interrupt levels manipulate the write-protection status, or when the interrupt handler needs to unprotect the peripheral, based on the current protection status, by reading WPSET.

[PM – Power Manager](#) on page 129

## **11.6. Register Description**

Atomic 8-, 16- and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly. Refer to the Product Mapping for PAC locations.

### **11.6.1. PAC0 Register Description**

### 11.6.1.1. Write Protect Clear

**Name:** WPCLR

**Offset:** 0x00

**Reset:** 0x0000000

**Property:** –

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access	R/W							
Reset	0	0	0	0	0	0	0	

#### Bit 6 – EIC

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 5 – RTC

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 4 – WDT

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

### Bit 3 – GCLK

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

### Bit 2 – SYSCTRL

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

### Bit 1 – PM

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

### 11.6.1.2. Write Protect Set

**Name:** WPSET

**Offset:** 0x04

**Reset:** 0x0000000

**Property:** –

Bit	31	30	29	28	27	26	25	24
Access								
Reset

Reset								
Bit	7	6	5	4	3	2	1	0
Access	R/W							
Reset	0	0	0	0	0	0	0	

#### Bit 6 – EIC

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 5 – RTC

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 4 – WDT

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

### Bit 3 – GCLK

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

### Bit 2 – SYSCTRL

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

### Bit 1 – PM

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

## 11.6.2. PAC1 Register Description

### 11.6.2.1. Write Protect Clear

**Name:** WPCLR

**Offset:** 0x00

**Reset:** 0x0000002

**Property:** –

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access				R/W	R/W	R/W		
Reset				0	0	1		

#### Bit 3 – PORT

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 2 – NVMCTRL

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 1 – DSU

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

### 11.6.2.2. Write Protect Set

**Name:** WPSET

**Offset:** 0x04

**Reset:** 0x0000002

**Property:** –

Bit	31	30	29	28	27	26	25	24

Bit	7	6	5	4	3	2	1	0
Access					R/W	R/W	R/W	
Reset					0	0	1	

#### Bit 3 – PORT

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 2 – NVMCTRL

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 1 – DSU

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

### 11.6.3. PAC2 Register Description

### 11.6.3.1. Write Protect Clear

**Name:** WPCLR  
**Offset:** 0x00  
**Reset:** 0x00800000  
**Property:** –

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access					PTC	DAC	AC	ADC
Reset					0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bit 19 – PTC

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 18 – DAC

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 17 – AC

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 16 – ADC

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bits 15,14,13,12,11,10,9,8 – TCx

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bits 7,6,5,4,3,2 – SERCOMx

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 1 – EVSYS

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

### 11.6.3.2. Write Protect Set

**Name:** WPSET  
**Offset:** 0x04  
**Reset:** 0x00800000  
**Property:** –

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access					PTC	DAC	AC	ADC
Reset					0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bit 19 – PTC

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 18 – DAC

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 17 – AC

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 16 – ADC

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bits 15,14,13,12,11,10,9,8 – TCx

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bits 7,6,5,4,3,2 – SERCOMx

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

#### Bit 1 – EVSYS

Writing a zero to these bits has no effect.

Writing a one to these bits will clear the Write Protect bit for the corresponding peripherals.

Value	Description
0	Write-protection is disabled.
1	Write-protection is enabled.

## 12. Peripherals Configuration Summary

The following table shows an overview of all the peripherals in the device. The IRQ Line column shows the interrupt mapping, as described in “Nested Vector Interrupt Controller” on page 30. The AHB and APB clock indexes correspond to the bit in the AHBMASK and APBMASK (x = A, B or C) registers in the Power Manager, while the Enabled at Reset column shows whether the peripheral clock is enabled at reset (Y) or not (N). Refer to the Power Manager AHBMASK, APBAMASK, APBBMASK and APBCMASK registers for details. The Generic Clock Index column corresponds to the value of the Generic Clock Selection ID bits in the Generic Clock Control register (CLKCTRL.ID) in the Generic Clock Controller. Refer to the GCLK CLKCTRL register description for details. The PAC Index column corresponds to the bit in the PAC<sub>i</sub> (i = 0, 1 or 2) registers, while the Prot at Reset column shows whether the peripheral is protected at reset (Y) or not (N). Refer to “PAC – Peripheral Access Controller” for details. The numbers in the Events User column correspond to the value of the User Multiplexer Selection bits in the User Multiplexer register (USER.USER) in the Event System. See the USER register description and Table 22-6 for details. The numbers in the Events Generator column correspond to the value of the Event Generator bits in the Channel register (CHANNEL.EVGEN) in the Event System. See the CHANNEL register description and Table 22-3 for details.

**Table 12-1. Peripherals Configuration Summary**

Peripheral Name	Base Address	IRQ Line	AHB Clock		APB Clock		Generic Clock	PAC		Events		SleepWalking

## 13. DSU - Device Service Unit

### 13.1. Overview

The Device Service Unit (DSU) provides a means to detect debugger probes. This enables the ARM Debug Access Port (DAP) to have control over multiplexed debug pads and CPU reset. The DSU also provides system-level services to debug adapters in an ARM debug system. It implements a CoreSight Debug ROM that provides device identification as well as identification of other debug components within the system. Hence, it complies with the ARM Peripheral Identification specification. The DSU also provides system services to applications that need memory testing, as required for IEC60730 Class B compliance, for example. The DSU can be accessed simultaneously by a debugger and the CPU, as it is connected on the High-Speed Bus Matrix. For security reasons, some of the DSU features will be limited or unavailable when the device is protected by the NVMCTRL security bit.

#### Related Links

[NVMCTRL – Non-Volatile Memory Controller](#) on page 297

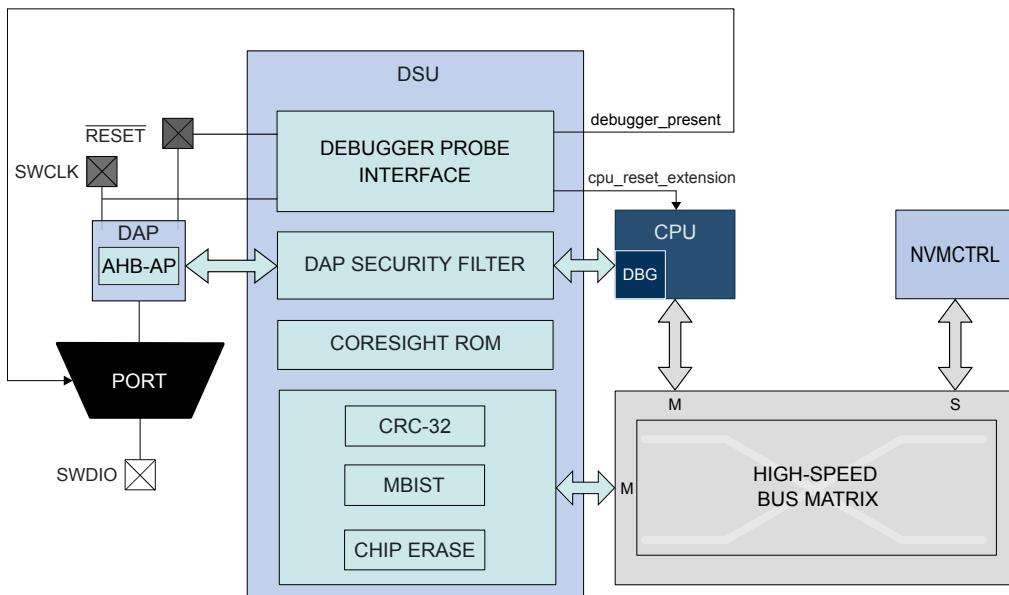

[Security Bit](#) on page 305

### 13.2. Features

- CPU reset extension
- Debugger probe detection (Cold- and Hot-Plugging)
- Chip-Erase command and status
- 32-bit cyclic redundancy check (CRC32) of any memory accessible through the bus matrix
- ARM® CoreSight™ compliant device identification
- Two debug communications channels
- Debug access port security filter
- Onboard memory built-in self-test (MBIST)

### 13.3. Block Diagram

Figure 13-1. DSU Block Diagram

### 13.4. Signal Description

The DSU uses three signals to function.

Signal Name	Type	Description
RESET	Digital Input	External reset
SWCLK	Digital Input	SW clock
SWDIO	Digital I/O	SW bidirectional data pin

#### Related Links

[I/O Multiplexing and Considerations](#) on page 27

### 13.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly, as described below.

#### 13.5.1. IO Lines

The SWCLK pin is by default assigned to the DSU module to allow debugger probe detection and to stretch the CPU reset phase. For more information, refer to [Debugger Probe Detection](#). The Hot-Plugging feature depends on the PORT configuration. If the SWCLK pin function is changed in the PORT or if the PORT\_MUX is disabled, the Hot-Plugging feature is disabled until a power-reset or an external reset.

#### 13.5.2. Power Management

The DSU will continue to operate in any sleep mode where the selected source clock is running.

#### Related Links

[PM – Power Manager](#) on page 129

### **13.5.3. Clocks**

The DSU bus clocks (CLK\_DSU\_APB and CLK\_DSU\_AHB) can be enabled and disabled by the Power Manager. Refer to *PM – Power Manager*

#### **Related Links**

[PM – Power Manager](#) on page 129

### **13.5.4. Interrupts**

Not applicable.

### **13.5.5. Events**

Not applicable.

### **13.5.6. Register Access Protection**

Registers with write-access can be optionally write-protected by the Peripheral Access Controller (PAC), except the following:

- Debug Communication Channel 0 register (DCC0)
- Debug Communication Channel 1 register (DCC1)

**Note:** Optional write-protection is indicated by the "PAC Write-Protection" property in the register description.

When the CPU is halted in debug mode, all write-protection is automatically disabled. Write-protection does not apply for accesses through an external debugger.

#### **Related Links**

[PAC - Peripheral Access Controller](#) on page 45

### **13.5.7. Analog Connections**

Not applicable.

## **13.6. Debug Operation**

### **13.6.1. Principle of Operation**

The DSU provides basic services to allow on-chip debug using the ARM Debug Access Port and the ARM processor debug resources:

- CPU reset extension
- Debugger probe detection

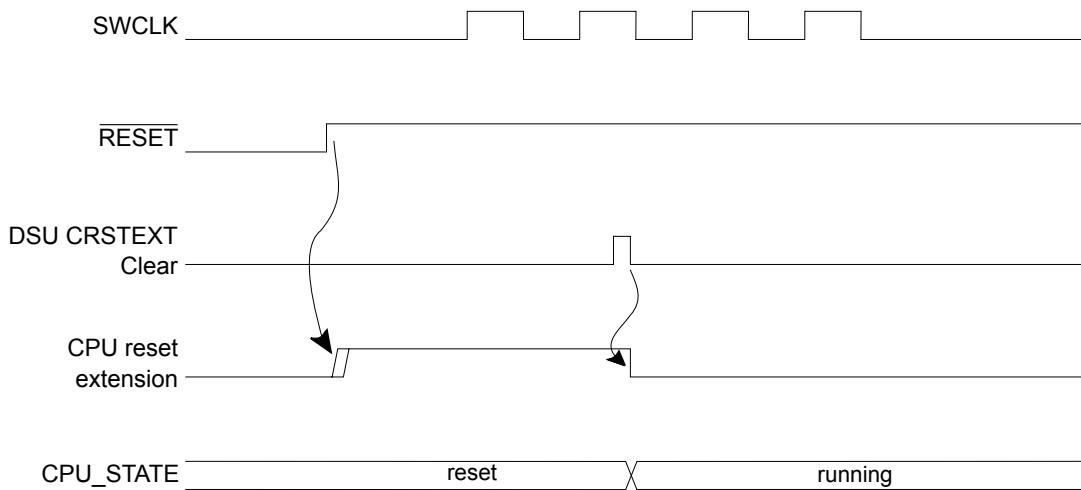

For more details on the ARM debug components, refer to the ARM Debug Interface v5 Architecture Specification.

### **13.6.2. CPU Reset Extension**

"CPU reset extension" refers to the extension of the reset phase of the CPU core after the external reset is released. This ensures that the CPU is not executing code at startup while a debugger connects to the system. It is detected on a  $\overline{\text{RESET}}$  release event when SWCLK is low. At startup, SWCLK is internally pulled up to avoid false detection of a debugger if SWCLK is left unconnected. When the CPU is held in the reset extension phase, the CPU Reset Extension bit of the Status A register (STATUSA.CRSTEXT) is set. To release the CPU, write a '1' to STATUSA.CRSTEXT. STATUSA.CRSTEXT will then be set to zero. Writing a '0' to STATUSA.CRSTEXT has no effect. For security reasons, it is not possible to release the

CPU reset extension when the device is protected by the NVMCTRL security bit. Trying to do so sets the Protection Error bit (PERR) of the Status A register (STATUSA.PERR).

**Figure 13-2. Typical CPU Reset Extension Set and Clear Timing Diagram**

### Related Links

[NVMCTRL – Non-Volatile Memory Controller](#) on page 297

[Security Bit](#) on page 305

### 13.6.3. Debugger Probe Detection

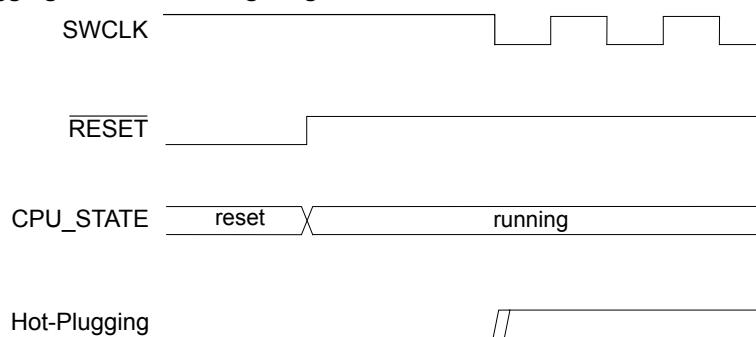

#### 13.6.3.1. Cold Plugging

Cold-Plugging is the detection of a debugger when the system is in reset. Cold-Plugging is detected when the CPU reset extension is requested, as described above.

#### 13.6.3.2. Hot Plugging

Hot-Plugging is the detection of a debugger probe when the system is not in reset. Hot-Plugging is not possible under reset because the detector is reset when POR or  $\overline{\text{RESET}}$  are asserted. Hot-Plugging is active when a SWCLK falling edge is detected. The SWCLK pad is multiplexed with other functions and the user must ensure that its default function is assigned to the debug system. If the SWCLK function is changed, the Hot-Plugging feature is disabled until a power-reset or external reset occurs. Availability of the Hot-Plugging feature can be read from the Hot-Plugging Enable bit of the Status B register (STATUSB.HPE).

**Figure 13-3. Hot-Plugging Detection Timing Diagram**

The presence of a debugger probe is detected when either Hot-Plugging or Cold-Plugging is detected. Once detected, the Debugger Present bit of the Status B register (STATUSB.DBGPRES) is set. For security reasons, Hot-Plugging is not available when the device is protected by the NVMCTRL security bit.

This detection requires that pads are correctly powered. Thus, at cold startup, this detection cannot be done until POR is released. If the device is protected, Cold-Plugging is the only way to detect a debugger probe, and so the external reset timing must be longer than the POR timing. If external reset is deasserted before POR release, the user must retry the procedure above until it gets connected to the device.

[Security Bit](#) on page 305

### 13.7. Chip Erase

Chip-Erase consists of removing all sensitive information stored in the chip and clearing the NVMCTRL security bit. Therefore, all volatile memories and the Flash memory (including the EEPROM emulation area) will be erased. The Flash auxiliary rows, including the user row, will not be erased.

When the device is protected, the debugger must reset the device in order to be detected. This ensures that internal registers are reset after the protected state is removed. The Chip-Erase operation is triggered by writing a '1' to the Chip-Erase bit in the Control register (CTRL.CE). This command will be discarded if the DSU is protected by the Peripheral Access Controller (PAC). Once issued, the module clears volatile memories prior to erasing the Flash array. To ensure that the Chip-Erase operation is completed, check the Done bit of the Status A register (STATUSA.DONE).

The Chip-Erase operation depends on clocks and power management features that can be altered by the CPU. For that reason, it is recommended to issue a Chip- Erase after a Cold-Plugging procedure to ensure that the device is in a known and safe state.

The recommended sequence is as follows:

1. Issue the Cold-Plugging procedure (refer to [Cold Plugging](#)). The device then:
  - 1.1. Detects the debugger probe.
  - 1.2. Holds the CPU in reset.
2. Issue the Chip-Erase command by writing a '1' to CTRL.CE. The device then:
  - 2.1. Clears the system volatile memories.
  - 2.2. Erases the whole Flash array (including the EEPROM emulation area, not including auxiliary rows).
  - 2.3. Erases the lock row, removing the NVMCTRL security bit protection.
3. Check for completion by polling STATUSA.DONE (read as one when completed).
4. Reset the device to let the NVMCTRL update fuses.

### 13.8. Programming

Programming the Flash or RAM memories is only possible when the device is not protected by the NVMCTRL security bit. The programming procedure is as follows:

1. At power up, RESET is driven low by a debugger. The on-chip regulator holds the system in a POR state until the input supply is above the POR threshold (refer to Power-On Reset (POR) characteristics). The system continues to be held in this static state until the internally regulated supplies have reached a safe operating state.
2. The PM starts, clocks are switched to the slow clock (Core Clock, System Clock, Flash Clock and any Bus Clocks that do not have clock gate control). Internal resets are maintained due to the external reset.

3. The debugger maintains a low level on SWCLK.  $\overline{\text{RESET}}$  is released, resulting in a debugger Cold-Plugging procedure.
4. The debugger generates a clock signal on the SWCLK pin, the Debug Access Port (DAP) receives a clock.
5. The CPU remains in Reset due to the Cold-Plugging procedure; meanwhile, the rest of the system is released.
6. A Chip-Erase is issued to ensure that the Flash is fully erased prior to programming.
7. Programming is available through the AHB-AP.
8. After the operation is completed, the chip can be restarted either by asserting  $\overline{\text{RESET}}$ , toggling power, or writing a '1' to the Status A register CPU Reset Phase Extension bit (STATUSA.CRSTEXT). Make sure that the SWCLK pin is high when releasing  $\overline{\text{RESET}}$  to prevent extending the CPU reset.

[Security Bit](#) on page 305

[Electrical Characteristics](#) on page 606

[Power-On Reset \(POR\) Characteristics](#) on page 616

### 13.9. Intellectual Property Protection

Intellectual property protection consists of restricting access to internal memories from external tools when the device is protected, and this is accomplished by setting the NVMCTRL security bit. This protected state can be removed by issuing a Chip-Erase (refer to [Chip Erase](#)). When the device is protected, read/write accesses using the AHB-AP are limited to the DSU address range and DSU commands are restricted. When issuing a Chip-Erase, sensitive information is erased from volatile memory and Flash.

The DSU implements a security filter that monitors the AHB transactions generated by the ARM AHB-AP inside the DAP. If the device is protected, then AHB-AP read/write accesses outside the DSU external address range are discarded, causing an error response that sets the ARM AHB-AP sticky error bits (refer to the ARM Debug Interface v5 Architecture Specification on <http://www.arm.com>).

The DSU is intended to be accessed either:

- Internally from the CPU, without any limitation, even when the device is protected
- Externally from a debug adapter, with some restrictions when the device is protected

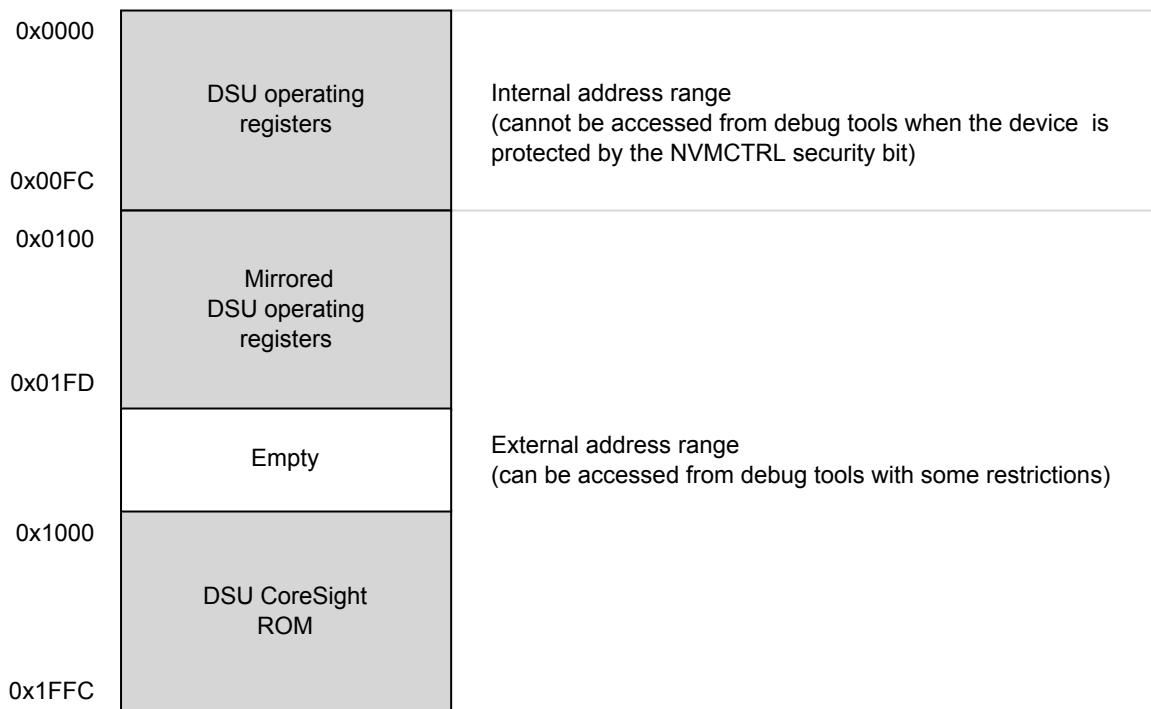

For security reasons, DSU features have limitations when used from a debug adapter. To differentiate external accesses from internal ones, the first 0x100 bytes of the DSU register map have been mirrored at offset 0x100:

- The first 0x100 bytes form the internal address range
- The next 0x100 bytes form the external address range

When the device is protected, the DAP can only issue MEM-AP accesses in the DSU address range limited to the 0x100- 0x2000 offset range.

The DSU operating registers are located in the 0x00-0xFF area and remapped in 0x100-0x1FF to differentiate accesses coming from a debugger and the CPU. If the device is protected and an access is issued in the region 0x100-0x1FF, it is subject to security restrictions. For more information, refer to the [Table 13-1](#).

**Figure 13-4. APB Memory Mapping**

Some features not activated by APB transactions are not available when the device is protected:

**Table 13-1. Feature Availability Under Protection**

Features	Availability when the device is protected
CPU Reset Extension	Yes
Clear CPU Reset Extension	No
Debugger Cold-Plugging	Yes
Debugger Hot-Plugging	No

## 13.10. Device Identification

Device identification relies on the ARM CoreSight component identification scheme, which allows the chip to be identified as an Atmel device implementing a DSU. The DSU contains identification registers to differentiate the device.

### 13.10.1. CoreSight Identification

A system-level ARM CoreSight ROM table is present in the device to identify the vendor and the chip identification method. Its address is provided in the MEM-AP BASE register inside the ARM Debug Access Port. The CoreSight ROM implements a 64-bit conceptual ID composed as follows from the PID0 to PID7 CoreSight ROM Table registers:

**Figure 13-5. Conceptual 64-bit Peripheral ID**

**Table 13-2. Conceptual 64-Bit Peripheral ID Bit Descriptions**

Field	Size	Description	Location
JEP-106 CC code	4	Atmel continuation code: 0x0	PID4
JEP-106 ID code	7	Atmel device ID: 0x1F	PID1+PID2
4KB count	4	Indicates that the CoreSight component is a ROM: 0x0	PID4
RevAnd	4	Not used; read as 0	PID3
CUSMOD	4	Not used; read as 0	PID3
PARTNUM	12	Contains 0xCD0 to indicate that DSU is present	PID0+PID1
REVISION	4	DSU revision (starts at 0x0 and increments by 1 at both major and minor revisions). Identifies DSU identification method variants. If 0x0, this indicates that device identification can be completed by reading the Device Identification register (DID)	PID3

For more information, refer to the ARM Debug Interface Version 5 Architecture Specification.

### 13.10.2. Chip Identification Method

The DSU DID register identifies the device by implementing the following information:

- Processor identification
- Product family identification
- Product series identification
- Device select

## 13.11. Functional Description

### 13.11.1. Principle of Operation

The DSU provides memory services such as CRC32 or MBIST that require almost the same interface. Hence, the Address, Length and Data registers (ADDR, LENGTH, DATA) are shared. These shared registers must be configured first; then a command can be issued by writing the Control register. When a command is ongoing, other commands are discarded until the current operation is completed. Hence, the user must wait for the STATUSA.DONE bit to be set prior to issuing another one.

## 13.11.2. Basic Operation

### 13.11.2.1. Initialization

The module is enabled by enabling its clocks. For more details, refer to [Clocks](#). The DSU registers can be PAC write-protected.

#### Related Links

[PAC - Peripheral Access Controller](#) on page 45

### 13.11.2.2. Operation From a Debug Adapter

Debug adapters should access the DSU registers in the external address range 0x100 – 0x2000. If the device is protected by the NVMCTRL security bit, accessing the first 0x100 bytes causes the system to return an error. Refer to [Intellectual Property Protection](#).

#### Related Links

[NVMCTRL – Non-Volatile Memory Controller](#) on page 297

[Security Bit](#) on page 305

### 13.11.2.3. Operation From the CPU

There are no restrictions when accessing DSU registers from the CPU. However, the user should access DSU registers in the internal address range (0x0 – 0x100) to avoid external security restrictions. Refer to [Intellectual Property Protection](#).

## 13.11.3. 32-bit Cyclic Redundancy Check CRC32

The DSU unit provides support for calculating a cyclic redundancy check (CRC32) value for a memory area (including Flash and AHB RAM).

When the CRC32 command is issued from:

- The internal range, the CRC32 can be operated at any memory location
- The external range, the CRC32 operation is restricted; DATA, ADDR, and LENGTH values are forced (see below)

**Table 13-3. AMOD Bit Descriptions when Operating CRC32**

AMOD[1:0]	Short name	External range restrictions
0	ARRAY	CRC32 is restricted to the full Flash array area (EEPROM emulation area not included) DATA forced to 0xFFFFFFFF before calculation (no seed)
1	EEPROM	CRC32 of the whole EEPROM emulation area DATA forced to 0xFFFFFFFF before calculation (no seed)
2-3	Reserved	

The algorithm employed is the industry standard CRC32 algorithm using the generator polynomial 0xEDB88320 (reversed representation).

### 13.11.3.1. Starting CRC32 Calculation

CRC32 calculation for a memory range is started after writing the start address into the Address register (ADDR) and the size of the memory range into the Length register (LENGTH). Both must be word-aligned.

The initial value used for the CRC32 calculation must be written to the Data register (DATA). This value will usually be 0xFFFFFFFF, but can be, for example, the result of a previous CRC32 calculation if generating a common CRC32 of separate memory blocks.

Once completed, the calculated CRC32 value can be read out of the Data register. The read value must be complemented to match standard CRC32 implementations or kept non-inverted if used as starting point for subsequent CRC32 calculations.

If the device is in protected state by the NVMCTRL security bit, it is only possible to calculate the CRC32 of the whole flash array when operated from the external address space. In most cases, this area will be the entire onboard non-volatile memory. The Address, Length and Data registers will be forced to predefined values once the CRC32 operation is started, and values written by the user are ignored. This allows the user to verify the contents of a protected device.

The actual test is started by writing a '1' in the 32-bit Cyclic Redundancy Check bit of the Control register (CTRL.CRC). A running CRC32 operation can be canceled by resetting the module (writing '1' to CTRL.SWRST).

#### Related Links

[NVMCTRL – Non-Volatile Memory Controller](#) on page 297

[Security Bit](#) on page 305

#### 13.11.3.2. Interpreting the Results

The user should monitor the Status A register. When the operation is completed, STATUSA.DONE is set. Then the Bus Error bit of the Status A register (STATUSA.BERR) must be read to ensure that no bus error occurred.

#### 13.11.4. Debug Communication Channels

The Debug Communication Channels (DCC0 and DCC1) consist of a pair of registers with associated handshake logic, accessible by both CPU and debugger even if the device is protected by the NVMCTRL security bit. The registers can be used to exchange data between the CPU and the debugger, during run time as well as in debug mode. This enables the user to build a custom debug protocol using only these registers.

The DCC0 and DCC1 registers are accessible when the protected state is active. When the device is protected, however, it is not possible to connect a debugger while the CPU is running (STATUSA.CRSTEXT is not writable and the CPU is held under Reset).

Two Debug Communication Channel status bits in the Status B registers (STATUS.DCCDx) indicate whether a new value has been written in DCC0 or DCC1. These bits, DCC0D and DCC1D, are located in the STATUSB registers. They are automatically set on write and cleared on read.

**Note:** The DCC0 and DCC1 registers are shared with the on-board memory testing logic (MBIST). Accordingly, DCC0 and DCC1 must not be used while performing MBIST operations.

#### Related Links

[NVMCTRL – Non-Volatile Memory Controller](#) on page 297

[Security Bit](#) on page 305

#### 13.11.5. Testing of On-Board Memories MBIST

The DSU implements a feature for automatic testing of memory also known as MBIST (memory built-in self test). This is primarily intended for production test of on-board memories. MBIST cannot be operated from the external address range when the device is protected by the NVMCTRL security bit. If an MBIST command is issued when the device is protected, a protection error is reported in the Protection Error bit in the Status A register (STATUSA.PERR).

##### 1. Algorithm

The algorithm used for testing is a type of March algorithm called "March LR". This algorithm is able to detect a wide range of memory defects, while still keeping a linear run time. The algorithm is:

- 1.1. Write entire memory to '0', in any order.
- 1.2. Bit for bit read '0', write '1', in descending order.
- 1.3. Bit for bit read '1', write '0', read '0', write '1', in ascending order.
- 1.4. Bit for bit read '1', write '0', in ascending order.
- 1.5. Bit for bit read '0', write '1', read '1', write '0', in ascending order.
- 1.6. Read '0' from entire memory, in ascending order.

The specific implementation used has a run time which depends on the CPU clock frequency and the number of bytes tested in the RAM. The detected faults are:

- Address decoder faults
- Stuck-at faults
- Transition faults
- Coupling faults
- Linked Coupling faults

## 2. Starting MBIST

To test a memory, you need to write the start address of the memory to the ADDR.ADDR bit field, and the size of the memory into the Length register.

For best test coverage, an entire physical memory block should be tested at once. It is possible to test only a subset of a memory, but the test coverage will then be somewhat lower.

The actual test is started by writing a '1' to CTRL.MBIST. A running MBIST operation can be canceled by writing a '1' to CTRL.SWRST.

## 3. Interpreting the Results

The tester should monitor the STATUSUA register. When the operation is completed, STATUSUA.DONE is set. There are two different modes:

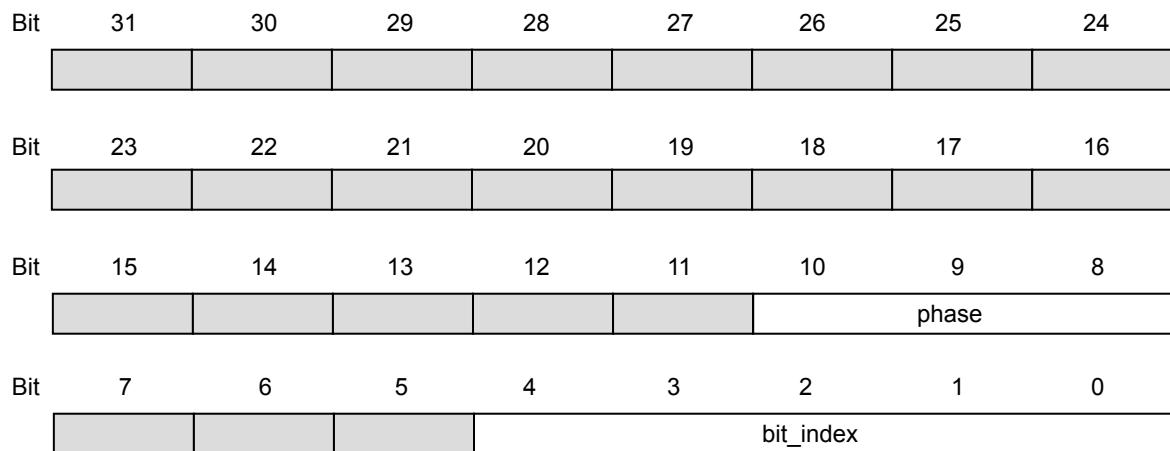

- ADDR.AMOD=0: exit-on-error (default)  
In this mode, the algorithm terminates either when a fault is detected or on successful completion. In both cases, STATUSUA.DONE is set. If an error was detected, STATUSUA.FAIL will be set. User then can read the DATA and ADDR registers to locate the fault.
- ADDR.AMOD=1: pause-on-error  
In this mode, the MBIST algorithm is paused when an error is detected. In such a situation, only STATUSUA.FAIL is asserted. The state machine waits for user to clear STATUSUA.FAIL by writing a '1' in STATUSUA.FAIL to resume. Prior to resuming, user can read the DATA and ADDR registers to locate the fault.

## 4. Locating Faults

If the test stops with STATUSUA.FAIL set, one or more bits failed the test. The test stops at the first detected error. The position of the failing bit can be found by reading the following registers:

- ADDR: Address of the word containing the failing bit
- DATA: contains data to identify which bit failed, and during which phase of the test it failed.  
The DATA register will in this case contains the following bit groups:

**Figure 13-6. DATA bits Description When MBIST Operation Returns an Error**

- **bit\_index:** contains the bit number of the failing bit
- **phase:** indicates which phase of the test failed and the cause of the error, as listed in the following table.

**Table 13-4. MBIST Operation Phases**

Phase	Test actions
0	Write all bits to zero. This phase cannot fail.
1	Read '0', write '1', increment address
2	Read '1', write '0'
3	Read '0', write '1', decrement address
4	Read '1', write '0', decrement address
5	Read '0', write '1'
6	Read '1', write '0', decrement address
7	Read all zeros. <b>bit_index</b> is not used

**Table 13-5. AMOD Bit Descriptions for MBIST**

AMOD[1:0]	Description
0x0	Exit on Error
0x1	Pause on Error
0x2, 0x3	Reserved

#### 13.11.6. System Services Availability when Accessed Externally

External access: Access performed in the DSU address offset 0x200-0x1FFF range.

Internal access: Access performed in the DSU address offset 0x0-0x100 range.

**Table 13-6. Available Features when Operated From The External Address Range and Device is Protected**

<b>Features</b>	<b>Availability From The External Address Range and Device is Protected</b>
Chip-Erase command and status	Yes
CRC32	Yes, only full array or full EEPROM
CoreSight Compliant Device identification	Yes
Debug communication channels	Yes
Testing of onboard memories (MBIST)	No
STATUSA.CRSTEXT clearing	No (STATUSA.PERR is set when attempting to do so)

## 13.12. Register Summary

Offset	Name	Bit Pos.								
0x00	CTRL	7:0	SMSA	ARR		CE	MBIST	CRC		SWRST

### 13.13. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16- and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers are optionally write-protected by the Peripheral Access Controller (PAC). Optional PAC write-protection is denoted by the "PAC Write-Protection" property in each individual register description. For details, refer to [Register Access Protection](#).

### 13.13.1. Control

**Name:** CTRL  
**Offset:** 0x0000  
**Reset:** 0x00  
**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
	SMSA	ARR		CE	MBIST	CRC		SWRST
Access	W	W		W	W	W		W
Reset	0	0		0	0	0		0

#### Bit 7 – SMSA: Start Memory Stream Access

Writing a '0' to this bit has no effect.

Writing a '1' to this bit starts memory stream access.

#### Bit 6 – ARR: Auxiliary Row Read

Writing a '0' to this bit has no effect.

Writing a '1' to this bit starts the Auxiliary Row Read.

#### Bit 4 – CE: Chip-Erase

Writing a '0' to this bit has no effect.

Writing a '1' to this bit starts the Chip-Erase operation.

#### Bit 3 – MBIST: Memory Built-In Self-Test

Writing a '0' to this bit has no effect.

Writing a '1' to this bit starts the memory BIST algorithm.

#### Bit 2 – CRC: 32-bit Cyclic Redundancy Check

Writing a '0' to this bit has no effect.

Writing a '1' to this bit starts the cyclic redundancy check algorithm.

#### Bit 0 – SWRST: Software Reset

Writing a '0' to this bit has no effect.

Writing a '1' to this bit resets the module.

### 13.13.2. Status A

**Name:** STATUSA  
**Offset:** 0x0001  
**Reset:** 0x00  
**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
				PERR	FAIL	BERR	CRSTEXT	DONE
Access				R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0

#### Bit 4 – PERR: Protection Error

Writing a '0' to this bit has no effect.

Writing a '1' to this bit clears the Protection Error bit.

This bit is set when a command that is not allowed in protected state is issued.

#### Bit 3 – FAIL: Failure

Writing a '0' to this bit has no effect.

Writing a '1' to this bit clears the Failure bit.

This bit is set when a DSU operation failure is detected.

#### Bit 2 – BERR: Bus Error

Writing a '0' to this bit has no effect.

Writing a '1' to this bit clears the Bus Error bit.

This bit is set when a bus error is detected.

#### Bit 1 – CRSTEXT: CPU Reset Phase Extension

Writing a '0' to this bit has no effect.

Writing a '1' to this bit clears the CPU Reset Phase Extension bit.

This bit is set when a debug adapter Cold-Plugging is detected, which extends the CPU reset phase.

#### Bit 0 – DONE: Done

Writing a '0' to this bit has no effect.

Writing a '1' to this bit clears the Done bit.

This bit is set when a DSU operation is completed.

### 13.13.3. Status B

**Name:** STATUSB  
**Offset:** 0x0002  
**Reset:** 0x1X  
**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
				HPE	DCCD1	DCCD0	DBGRES	PROT
Access				R	R	R	R	R
Reset				1	0	0	0	0

#### **Bit 4 – HPE: Hot-Plugging Enable**

Writing a '0' to this bit has no effect.

Writing a '1' to this bit has no effect.

This bit is set when Hot-Plugging is enabled.

This bit is cleared when Hot-Plugging is disabled. This is the case when the SWCLK function is changed. Only a power-reset or a external reset can set it again.

#### **Bits 3,2 – DCCDx: Debug Communication Channel x Dirty [x=1..0]**

Writing a '0' to this bit has no effect.

Writing a '1' to this bit has no effect.

This bit is set when DCCx is written.

This bit is cleared when DCCx is read.

#### **Bit 1 – DBGRES: Debugger Present**

Writing a '0' to this bit has no effect.

Writing a '1' to this bit has no effect.

This bit is set when a debugger probe is detected.

This bit is never cleared.

#### **Bit 0 – PROT: Protected**

Writing a '0' to this bit has no effect.

Writing a '1' to this bit has no effect.

This bit is set at power-up when the device is protected.

This bit is never cleared.

#### 13.13.4. Address

**Name:** ADDR  
**Offset:** 0x0004  
**Reset:** 0x00000000  
**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
ADDR[29:22]								
Access	R/W	R/W						
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
ADDR[21:14]								
Access	R/W	R/W						
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
ADDR[13:6]								
Access	R/W	R/W						
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
ADDR[5:0]							AMOD[1:0]	
Access	R/W	R/W						
Reset	0	0	0	0	0	0	0	0

#### Bits 31:2 – ADDR[29:0]: Address

Initial word start address needed for memory operations.

#### Bits 1:0 – AMOD[1:0]: Access Mode

The functionality of these bits is dependent on the operation mode.

Bit description when operating CRC32: refer to [32-bit Cyclic Redundancy Check CRC32](#)

Bit description when testing onboard memories (MBIST): refer to [Testing of On-Board Memories MBIST](#)

### 13.13.5. Length

**Name:** LENGTH  
**Offset:** 0x0008  
**Reset:** 0x00000000  
**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
LENGTH[29:22]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
LENGTH[21:14]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
LENGTH[13:6]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
LENGTH[5:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 31:2 – LENGTH[29:0]: Length

Length in words needed for memory operations.

### 13.13.6. Data

**Name:** DATA  
**Offset:** 0x000C  
**Reset:** 0x00000000  
**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
DATA[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DATA[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DATA[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DATA[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – DATA[31:0]: Data

Memory operation initial value or result value.

### 13.13.7. Debug Communication Channel 0

**Name:** DCC0  
**Offset:** 0x0010  
**Reset:** 0x00000000  
**Property:** -

Bit	31	30	29	28	27	26	25	24
DATA[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DATA[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DATA[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DATA[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – DATA[31:0]: Data

Data register.

### 13.13.8. Debug Communication Channel 1

**Name:** DCC1  
**Offset:** 0x0014  
**Reset:** 0x00000000  
**Property:** -

Bit	31	30	29	28	27	26	25	24
DATA[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DATA[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DATA[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DATA[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – DATA[31:0]: Data

Data register.

### 13.13.9. Device Identification

The information in this register is related to the *Ordering Information*.

**Name:** DID

**Offset:** 0x0018

**Reset:** see related links

**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
	PROCESSOR[3:0]					FAMILY[4:1]		
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	FAMILY[0:0]		SERIES[5:0]					
Access	R		R	R	R	R	R	R
Reset	0		0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	DIE[3:0]				REVISION[3:0]			
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DEVSEL[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 31:28 – PROCESSOR[3:0]: Processor

The value of this field defines the processor used on the device.

#### Bits 27:23 – FAMILY[4:0]: Product Family

The value of this field corresponds to the Product Family part of the ordering code.

#### Bits 21:16 – SERIES[5:0]: Product Series

The value of this field corresponds to the Product Series part of the ordering code.

#### Bits 15:12 – DIE[3:0]: Die Number

Identifies the die family.

#### Bits 11:8 – REVISION[3:0]: Revision Number

Identifies the die revision number. 0x0=rev.A, 0x1=rev.B etc.

**Note:** The device variant (last letter of the ordering number) is independent of the die revision (DSU.DID.REVISION): The device variant denotes functional differences, whereas the die revision marks evolution of the die.

#### Bits 7:0 – DEVSEL[7:0]: Device Selection

This bit field identifies a device within a product family and product series. Refer to the Ordering Information for device configurations and corresponding values for Flash memory density, pin count and device variant.

**Table 13-7. Device Selection**

<b>DEVSEL</b>	<b>Device</b>	<b>Flash (KB)</b>	<b>RAM (KB)</b>	<b>Pin count</b>
0x0	SAMD20J18A	256	32	64
0x1	SAMD20J17A	128	16	64
0x2	SAMD20J16A	64	8	64
0x3	SAMD20J15A	32	4	64
0x4	SAMD20J14A	16	2	64
0x5	SAMD20G18A	256	32	48
0x6	SAMD20G17A	128	16	48
0x7	SAMD20G16A	64	8	48
0x8	SAMD20G15A	32	4	48
0x9	SAMD20G14A	16	2	48
0xA	SAMD20E18A	256	32	32
0xB	SAMD20E17A	128	16	32
0xC	SAMD20E16A	64	8	32
0xD	SAMD20E15A	32	4	32
0xE	SAMD20E14A	16	2	32
0xF-0xFF	Reserved			

### 13.13.10. CoreSight ROM Table Entry 0

**Name:** ENTRY0  
**Offset:** 0x1000  
**Reset:** 0xXXXXX00X  
**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
ADDOFF[19:12]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
ADDOFF[11:4]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
ADDOFF[3:0]								
Access	R	R	R	R				
Reset	0	0	0	0				
Bit	7	6	5	4	3	2	1	0
FMT EPRES								
Access							R	R
Reset							1	0

#### Bits 31:12 – ADDOFF[19:0]: Address Offset

The base address of the component, relative to the base address of this ROM table.

#### Bit 1 – FMT: Format

Always reads as '1', indicating a 32-bit ROM table.

#### Bit 0 – EPRES: Entry Present

This bit indicates whether an entry is present at this location in the ROM table.

This bit is set at power-up if the device is not protected indicating that the entry is not present.

This bit is cleared at power-up if the device is not protected indicating that the entry is present.

### 13.13.11. CoreSight ROM Table Entry 1

**Name:** ENTRY1  
**Offset:** 0x1004  
**Reset:** 0xXXXXX00X  
**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
ADDOFF[19:12]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
ADDOFF[11:4]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
ADDOFF[3:0]								
Access	R	R	R	R				
Reset	0	0	0	0				
Bit	7	6	5	4	3	2	1	0
FMT EPRES								
Access							R	R
Reset							1	0

#### Bits 31:12 – ADDOFF[19:0]: Address Offset

The base address of the component, relative to the base address of this ROM table.

#### Bit 1 – FMT: Format

Always read as '1', indicating a 32-bit ROM table.

#### Bit 0 – EPRES: Entry Present

This bit indicates whether an entry is present at this location in the ROM table.

This bit is set at power-up if the device is not protected indicating that the entry is not present.

This bit is cleared at power-up if the device is not protected indicating that the entry is present.

### 13.13.12. CoreSight ROM Table End

**Name:** END  
**Offset:** 0x1008  
**Reset:** 0x00000000  
**Property:** -

Bit	31	30	29	28	27	26	25	24
END[31:24]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
END[23:16]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
END[15:8]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
END[7:0]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – END[31:0]: End Marker

Indicates the end of the CoreSight ROM table entries.

### 13.13.13. CoreSight ROM Table Memory Type

**Name:** MEMTYPE

**Offset:** 0x1FCC

**Reset:** 0x0000000X

**Property:** -

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access								R
Reset								0

#### Bit 0 – SMEMP: System Memory Present

This bit indicates whether system memory is present on the bus that connects to the ROM table.

This bit is set at power-up if the device is not protected, indicating that the system memory is accessible from a debug adapter.

This bit is cleared at power-up if the device is protected, indicating that the system memory is not accessible from a debug adapter.

#### 13.13.14. Peripheral Identification 4

**Name:** PID4  
**Offset:** 0x1FD0  
**Reset:** 0x00000000

## 14. Clock System

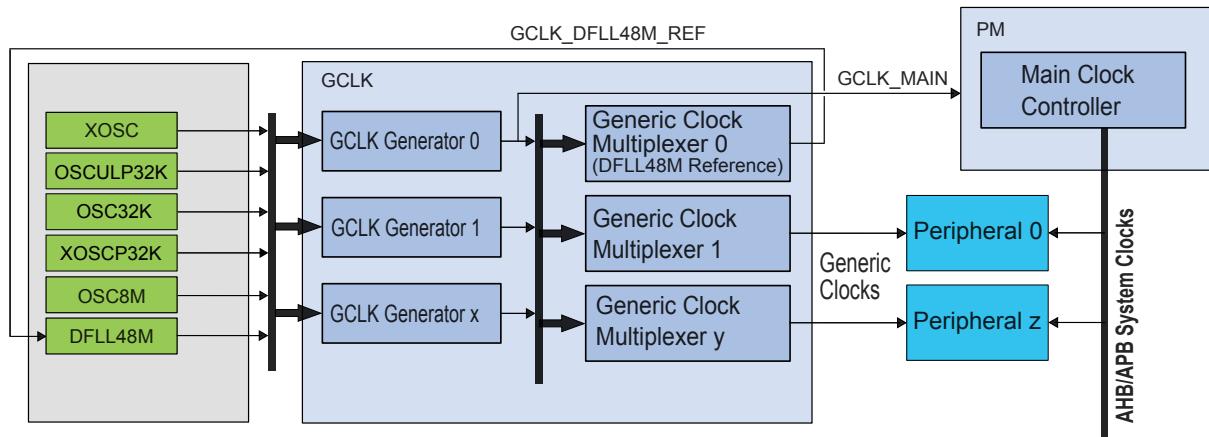

This chapter summarizes the clock distribution and terminology in the SAM D20 device. It will not explain every detail of its configuration. For in-depth documentation, see the respective peripherals descriptions and the *Generic Clock* documentation.

### Related Links

[GCLK - Generic Clock Controller](#) on page 108

### 14.1. Clock Distribution

Figure 14-1. Clock distribution

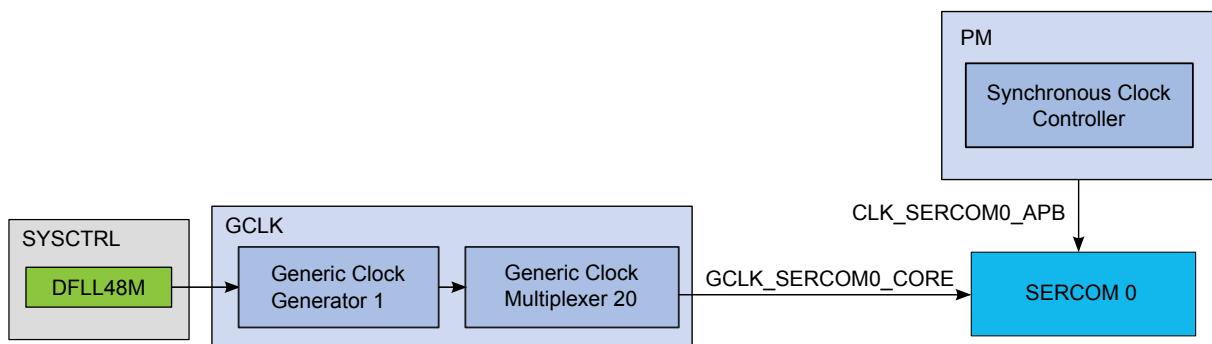

The clock system on the SAM D20 consists of:

- *Clock sources*, controlled by SYSCTRL
  - A clock source provides a time base that is used by other components, such as Generic Clock Generators. Example clock sources are the internal 8MHz oscillator (OSC8M), External crystal oscillator (XOSC) and the Digital frequency locked loop (DFLL48M).
- *Generic Clock Controller (GCLK)* which controls the clock distribution system, made up of:
  - *Generic Clock Generators*: These are programmable prescalers that can use any of the system clock sources as a time base. The Generic Clock Generator 0 generates the clock signal GCLK\_MAIN, which is used by the Power Manager, which in turn generates synchronous clocks.
  - *Generic Clocks*: These are clock signals generated by Generic Clock Generators and output by the Generic Clock Multiplexer, and serve as clocks for the peripherals of the system. Multiple instances of a peripheral will typically have a separate Generic Clock for each instance. Generic Clock 0 serves as the clock source for the DFLL48M clock input (when multiplying another clock source).
- *Power Manager (PM)*
  - The PM generates and controls the synchronous clocks on the system. This includes the CPU, bus clocks (APB, AHB) as well as the synchronous (to the CPU) user interfaces of the peripherals. It contains clock masks that can turn on/off the user interface of a peripheral as well as prescalers for the CPU and bus clocks.

The next figure shows an example where SERCOM0 is clocked by the DFLL48M in open loop mode. The DFLL48M is enabled, the Generic Clock Generator 1 uses the DFLL48M as its clock source and feeds into Peripheral Channel 20. The Generic Clock 20, also called GCLK\_SERCOM0\_CORE, is connected to

SERCOM0. The SERCOM0 interface, clocked by CLK\_SERCOM0\_APB, has been unmasked in the APBC Mask register in the PM.

**Figure 14-2. Example of SERCOM clock**

## 14.2. Synchronous and Asynchronous Clocks

As the CPU and the peripherals can be in different clock domains, i.e. they are clocked from different clock sources and/or with different clock speeds, some peripheral accesses by the CPU need to be synchronized. In this case the peripheral includes a SYNCBUSY status register that can be used to check if a sync operation is in progress.

For a general description, see [Register Synchronization](#). Some peripherals have specific properties described in their individual sub-chapter “Synchronization”.

In the datasheet, references to Synchronous Clocks are referring to the CPU and bus clocks, while asynchronous clocks are generated by the Generic Clock Controller (GCLK).

## 14.3. Register Synchronization

There are two different register synchronization schemes implemented on this device: *common synchronizer register synchronization* and *distributed synchronizer register synchronization*.

The modules using a common synchronizer register synchronization are: GCLK, WDT, RTC, EIC, TC, ADC, AC and DAC.

The modules adopting a distributed synchronizer register synchronization are: SERCOM USART, SERCOM SPI, SERCOM I2C.

### 14.3.1. Common Synchronizer Register Synchronization

#### 14.3.1.1. Overview

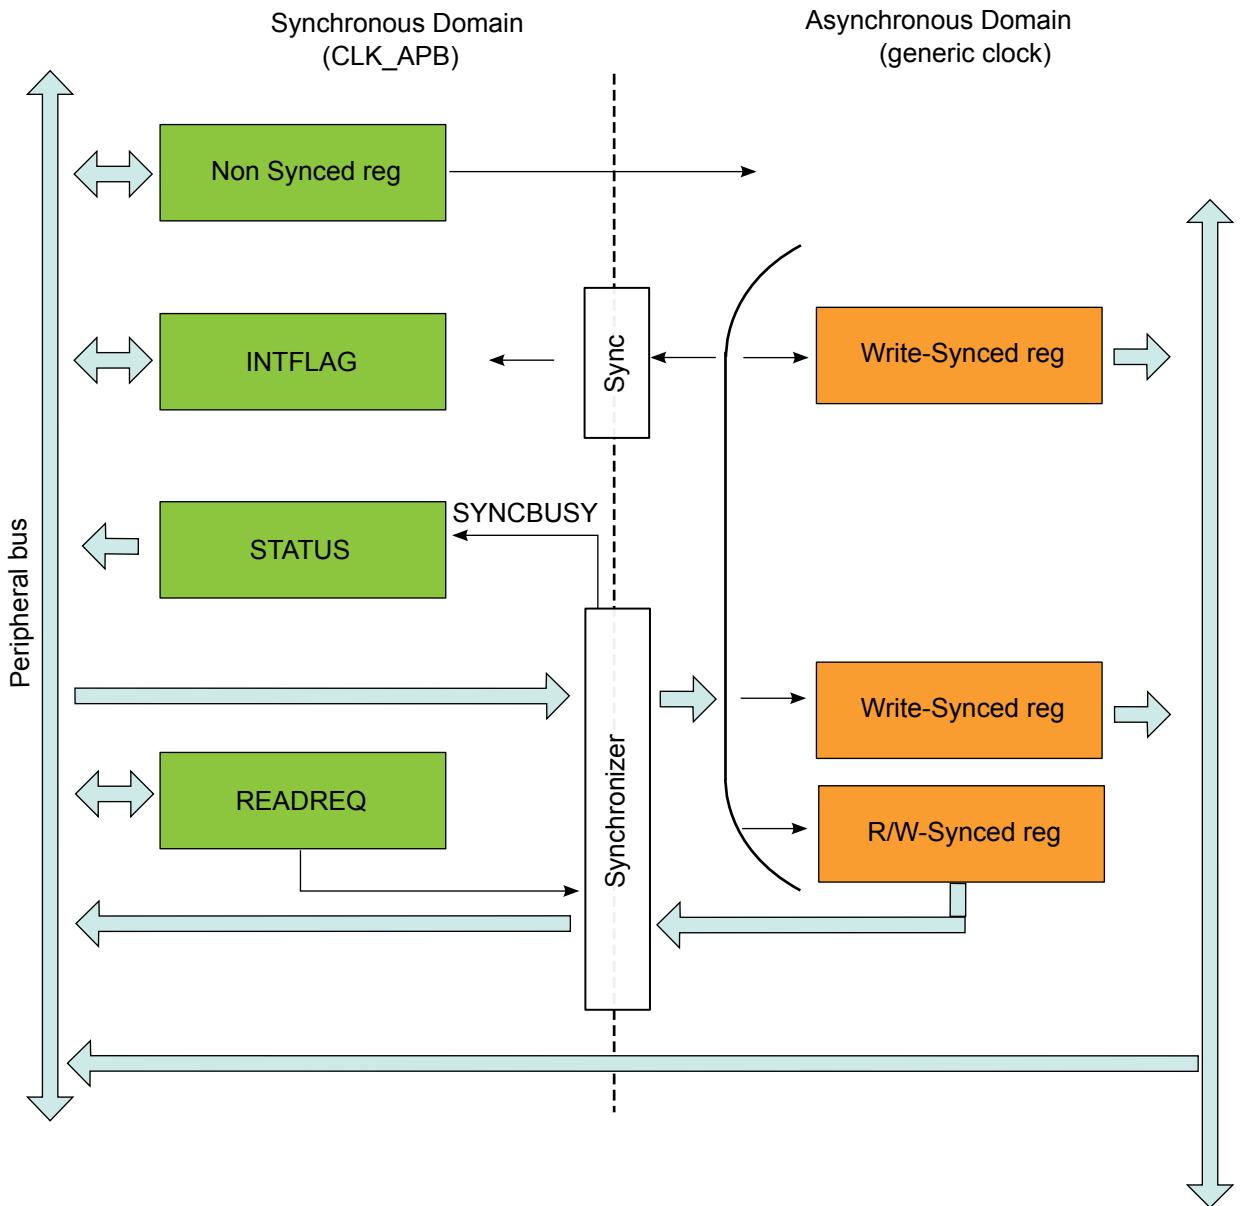

All peripherals are composed of one digital bus interface connected to the APB or AHB bus and running from a corresponding clock in the Main Clock domain, and one peripheral core running from the peripheral Generic Clock (GCLK).

Communication between these clock domains must be synchronized. This mechanism is implemented in hardware, so the synchronization process takes place even if the peripheral generic clock is running from the same clock source and on the same frequency as the bus interface.

All registers in the bus interface are accessible without synchronization. All registers in the peripheral core are synchronized when written. Some registers in the peripheral core are synchronized when read. Each individual register description will have the properties “Read-Synchronized” and/or “Write-Synchronized” if a register is synchronized.

As shown in the figure below, the common synchronizer is used for all registers in one peripheral. Therefore, status register (STATUS) of each peripheral can be synchronized at a time.

**Figure 14-3. Synchronization**

#### 14.3.1.2. Write-Synchronization

Write-Synchronization is triggered by writing to a register in the peripheral clock domain. The Synchronization Busy bit in the Status register (STATUS.SYNCBUSY) will be set when the write-synchronization starts and cleared when the write-synchronization is complete. Refer to [Synchronization Delay](#) for details on the synchronization delay.

When the write-synchronization is ongoing (STATUS.SYNCBUSY is one), any of the following actions will cause the peripheral bus to stall until the synchronization is complete:

- Writing a generic clock peripheral core register
- Reading a read-synchronized peripheral core register
- Reading the register that is being written (and thus triggered the synchronization)

Peripheral core registers without read-synchronization will remain static once they have been written and synchronized, and can be read while the synchronization is ongoing without causing the peripheral bus to stall. APB registers can also be read while the synchronization is ongoing without causing the peripheral bus to stall.

#### 14.3.1.3. Read-Synchronization

Reading a read-synchronized peripheral core register will cause the peripheral bus to stall immediately until the read-synchronization is complete. STATUS.SYNCBUSY will not be set. Refer to [Synchronization Delay](#) for details on the synchronization delay. Note that reading a read-synchronized peripheral core register while STATUS.SYNCBUSY is one will cause the peripheral bus to stall twice; first because of the ongoing synchronization, and then again because reading a read-synchronized core register will cause the peripheral bus to stall immediately.

#### 14.3.1.4. Completion of synchronization

The user can either poll STATUS.SYNCBUSY or use the Synchronisation Ready interrupt (if available) to check when the synchronization is complete. It is also possible to perform the next read/write operation and wait, as this next operation will be started once the previous write/read operation is synchronized and/or complete.

#### 14.3.1.5. Read Request

The read request functionality is only available to peripherals that have the Read Request register (READREQ) implemented. Refer to the register description of individual peripheral chapters for details.

To avoid forcing the peripheral bus to stall when reading read-synchronized peripheral core registers, the read request mechanism can be used.

##### Basic Read Request

Writing a '1' to the Read Request bit in the Read Request register (READREQ.RREQ) will request read-synchronization of the register specified in the Address bits in READREQ (READREQ.ADDR) and set STATUS.SYNCBUSY. When read-synchronization is complete, STATUS.SYNCBUSY is cleared. The read-synchronized value is then available for reading without delay until READREQ.RREQ is written to '1' again.

The address to use is the offset to the peripheral's base address of the register that should be synchronized.

##### Continuous Read Request

Writing a '1' to the Read Continuously bit in READREQ (READREQ.RCONT) will force continuous read-synchronization of the register specified in READREQ.ADDR. The latest value is always available for reading without stalling the bus, as the synchronization mechanism is continuously synchronizing the given value.

SYNCBUSY is set for the first synchronization, but not for the subsequent synchronizations. If another synchronization is attempted, i.e. by executing a write-operation of a write-synchronized register, the read request will be stopped, and will have to be manually restarted.

##### Note:

The continuous read-synchronization is paused in sleep modes where the generic clock is not running. This means that a new read request is required if the value is needed immediately after exiting sleep.

#### 14.3.1.6. Enable Write-Synchronization

Writing to the Enable bit in the Control register (CTRL.ENABLE) will also trigger write-synchronization and set STATUS.SYNCBUSY. CTRL.ENABLE will read its new value immediately after being written. The Synchronisation Ready interrupt (if available) cannot be used for Enable write-synchronization.

When the enable write-synchronization is ongoing (STATUS.SYNCBUSY is one), attempt to do any of the following will cause the peripheral bus to stall until the enable synchronization is complete:

- Writing a peripheral core register
- Writing an APB register
- Reading a read-synchronized peripheral core register

APB registers can be read while the enable write-synchronization is ongoing without causing the peripheral bus to stall.

#### 14.3.1.7. Software Reset Write-Synchronization

Writing a '1' to the Software Reset bit in CTRL (CTRL.SWRST) will also trigger write-synchronization and set STATUS.SYNCBUSY. When writing a '1' to the CTRL.SWRST bit it will immediately read as '1'.

CTRL.SWRST and STATUS.SYNCBUSY will be cleared by hardware when the peripheral has been reset. Writing a zero to the CTRL.SWRST bit has no effect. The Synchronisation Ready interrupt (if available) cannot be used for Software Reset write-synchronization.

When the software reset is in progress (STATUS.SYNCBUSY and CTRL.SWRST are '1'), attempt to do any of the following will cause the peripheral bus to stall until the Software Reset synchronization and the reset is complete:

- Writing a peripheral core register
- Writing an APB register
- Reading a read-synchronized register

APB registers can be read while the software reset is being write-synchronized without causing the peripheral bus to stall.

#### 14.3.1.8. Synchronization Delay

The synchronization will delay write and read accesses by a certain amount. This delay  $D$  is within the range of:

$$5 \times P_{\text{GCLK}} + 2 \times P_{\text{APB}} < D < 6 \times P_{\text{GCLK}} + 3 \times P_{\text{APB}}$$

Where  $P_{\text{GCLK}}$  is the period of the generic clock and  $P_{\text{APB}}$  is the period of the peripheral bus clock. A normal peripheral bus register access duration is  $2 \times P_{\text{APB}}$ .

### 14.3.2. Distributed Synchronizer Register Synchronization

#### 14.3.2.1. Overview

All peripherals are composed of one digital bus interface connected to the APB or AHB bus and running from a corresponding clock in the Main Clock domain, and one peripheral core running from the peripheral Generic Clock (GCLK).

Communication between these clock domains must be synchronized. This mechanism is implemented in hardware, so the synchronization process takes place even if the peripheral generic clock is running from the same clock source and on the same frequency as the bus interface.

All registers in the bus interface are accessible without synchronization. All registers in the peripheral core are synchronized when written. Some registers in the peripheral core are synchronized when read. Registers that need synchronization have this denoted in each individual register description.

#### 14.3.2.2. General Write synchronization

Write-Synchronization is triggered by writing to a register in the peripheral clock domain. The respective bit in the Synchronization Busy register (SYNCBUSY) will be set when the write-synchronization starts and cleared when the write-synchronization is complete. Refer to [Synchronization Delay](#) for details on the synchronization delay.

When write-synchronization is ongoing for a register, any subsequent write attempts to this register will be discarded, and an error will be reported.

Example:

REGA, REGB are 8-bit peripheral core registers. REGC is 16-bit peripheral core register.

Offset	Register
0x00	REGA
0x01	REGB
0x02	REGC
0x03	

Synchronization is per register, so multiple registers can be synchronized in parallel. Consequently, after REGA (8-bit access) was written, REGB (8-bit access) can be written immediately without error.

REGC (16-bit access) can be written without affecting REGA or REGB. If REGC is written to in two consecutive 8-bit accesses without waiting for synchronization, the second write attempt will be discarded and an error is generated.

A 32-bit access to offset 0x00 will write all three registers. Note that REGA, REGB and REGC can be updated at different times because of independent write synchronization.

#### 14.3.2.3. General read synchronization

Read-synchronized registers are synchronized when the register value is updated. During synchronization the corresponding bit in SYNCBUSY will be set. Reading a read-synchronized register will return its value immediately and the corresponding bit in SYNCBUSY will not be set.

#### 14.3.2.4. Completion of synchronization

In order to check if synchronization is complete, the user can either poll the relevant bits in SYNCBUSY or use the Synchronisation Ready interrupt (if available). The Synchronisation Ready interrupt flag will be set when all ongoing synchronizations are complete, i.e. when all bits in SYNCBUSY are '0'.

#### 14.3.2.5. Enable Write-Synchronization

Setting the Enable bit in a module's Control register (CTRL.ENABLE) will also trigger write-synchronization and set SYNCBUSY.ENABLE. CTRL.ENABLE will read its new value immediately after being written. SYNCBUSY.ENABLE will be cleared by hardware when the operation is complete. The Synchronisation Ready interrupt (if available) cannot be used for Enable write-synchronization.

#### 14.3.2.6. Software Reset Write-Synchronization

Setting the Software Reset bit in CTRLA (CTRLA.SWRST=1) will trigger write-synchronization and set SYNCBUSY.SWRST. When writing a '1' to the CTRLA.SWRST bit it will immediately read as '1'. CTRLA.SWRST and SYNCBUSY.SWRST will be cleared by hardware when the peripheral has been reset. Writing a '0' to the CTRLA.SWRST bit has no effect. The Ready interrupt (if available) cannot be used for Software Reset write-synchronization.

#### 14.3.2.7. Synchronization Delay

The synchronization will delay write and read accesses by a certain amount. This delay  $D$  is within the range of:

$$5 \times P_{GCLK} + 2 \times P_{APB} < D < 6 \times P_{GCLK} + 3 \times P_{APB}$$

Where  $P_{GCLK}$  is the period of the generic clock and  $P_{APB}$  is the period of the peripheral bus clock. A normal peripheral bus register access duration is  $2 \times P_{APB}$ .

## 14.4. Enabling a Peripheral

In order to enable a peripheral that is clocked by a Generic Clock, the following parts of the system needs to be configured:

- A running Clock Source.
- A clock from the Generic Clock Generator must be configured to use one of the running Clock Sources, and the Generator must be enabled.
- The Generic Clock Multiplexer that provides the Generic Clock signal to the peripheral must be configured to use a running Generic Clock Generator, and the Generic Clock must be enabled.
- The user interface of the peripheral needs to be unmasked in the PM. If this is not done the peripheral registers will read all 0's and any writing attempts to the peripheral will be discarded.

## 14.5. Disabling a Peripheral

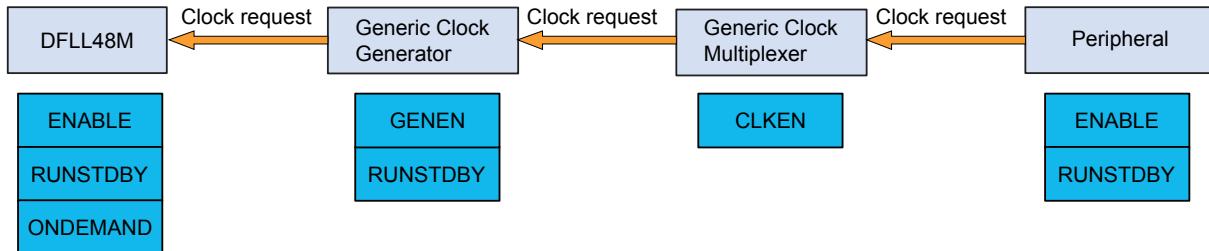

When disabling a peripheral and if a pin change interrupt is enabled on pins driven by the respective peripheral, a wake condition may be generated. If this happen the interrupt flag will not be set. As a consequence the system will not be able to identify the wake source. To avoid this, the interrupt enable register of the peripheral must be cleared (or the Nested Vectored Interrupt Controller (NVIC) Enable for the peripheral must be cleared) before disabling the peripheral.

### Related Links

[Nested Vector Interrupt Controller](#) on page 41

## 14.6. On-demand, Clock Requests

Figure 14-4. Clock request routing

All clock sources in the system can be run in an on-demand mode: the clock source is in a stopped state unless a peripheral is requesting the clock source. Clock requests propagate from the peripheral, via the GCLK, to the clock source. If one or more peripheral is using a clock source, the clock source will be started/kept running. As soon as the clock source is no longer needed and no peripheral has an active request, the clock source will be stopped until requested again.

The clock request can reach the clock source only if the peripheral, the generic clock and the clock from the Generic Clock Generator in-between are enabled. The time taken from a clock request being asserted to the clock source being ready is dependent on the clock source startup time, clock source frequency as well as the divider used in the Generic Clock Generator. The total startup time  $T_{start}$  from a clock request until the clock is available for the peripheral is between:

$$T_{start\_max} = \text{Clock source startup time} + 2 \times \text{clock source periods} + 2 \times \text{divided clock source periods}$$

$$T_{start\_min} = \text{Clock source startup time} + 1 \times \text{clock source period} + 1 \times \text{divided clock source period}$$

The time between the last active clock request stopped and the clock is shut down,  $T_{stop}$ , is between:

$$T_{stop\_min} = 1 \times \text{divided clock source period} + 1 \times \text{clock source period}$$

$$T_{stop\_max} = 2 \times \text{divided clock source periods} + 2 \times \text{clock source periods}$$

The On-Demand function can be disabled individually for each clock source by clearing the ONDEMAND bit located in each clock source controller. Consequently, the clock will always run whatever the clock request status is. This has the effect of removing the clock source startup time at the cost of power consumption.

The clock request mechanism can be configured to work in standby mode by setting the RUNSDBY bits of the modules, see [Figure 14-4](#).

## 14.7. Power Consumption vs. Speed

When targeting for either a low-power or a fast acting system, some considerations have to be taken into account due to the nature of the asynchronous clocking of the peripherals:

If clocking a peripheral with a very low clock, the active power consumption of the peripheral will be lower. At the same time the synchronization to the synchronous (CPU) clock domain is dependent on the peripheral clock speed, and will take longer with a slower peripheral clock. This will cause worse response times and longer synchronization delays.

## 14.8. Clocks after Reset

On any reset the synchronous clocks start to their initial state:

- OSC8M is enabled and divided by 8
- Generic Generator 0 uses OSC8M as source and generates GCLK\_MAIN
- CPU and BUS clocks are undivided

On a Power Reset, the GCLK module starts to its initial state:

- All Generic Clock Generators are disabled except
  - Generator 0 is using OSC8M as source without division and generates GCLK\_MAIN
  - Generator 2 uses OSCULP32K as source without division
- All Generic Clocks are disabled except:
  - WDT Generic Clock uses the Generator 2 as source

On a User Reset the GCLK module starts to its initial state, except for:

- Generic Clocks that are write-locked , i.e., the according WRTLOCK is set to 1 prior to Reset or WDT Generic Clock if the WDT Always-On at power on bit set in the NVM User Row
- Generic Clock is dedicated to the RTC if the RTC Generic Clock is enabled

On any reset the clock sources are reset to their initial state except the 32KHz clock sources which are reset only by a power reset.

## 15. GCLK - Generic Clock Controller

### 15.1. Overview

Depending on the application, peripherals may require specific clock frequencies to operate correctly. The Generic Clock controller GCLK provides nine Generic Clock Generators that can provide a wide range of clock frequencies.

Generators can be set to use different external and internal oscillators as source. The clock of each Generator can be divided. The outputs from the Generators are used as sources for the Generic Clock Multiplexers, which provide the Generic Clock (GCLK\_PERIPHERAL) to the peripheral modules, as shown in Generic Clock Controller Block Diagram. The number of Peripheral Clocks depends on how many peripherals the device has.

**Note:** The Generator 0 is always the direct source of the GCLK\_MAIN signal.

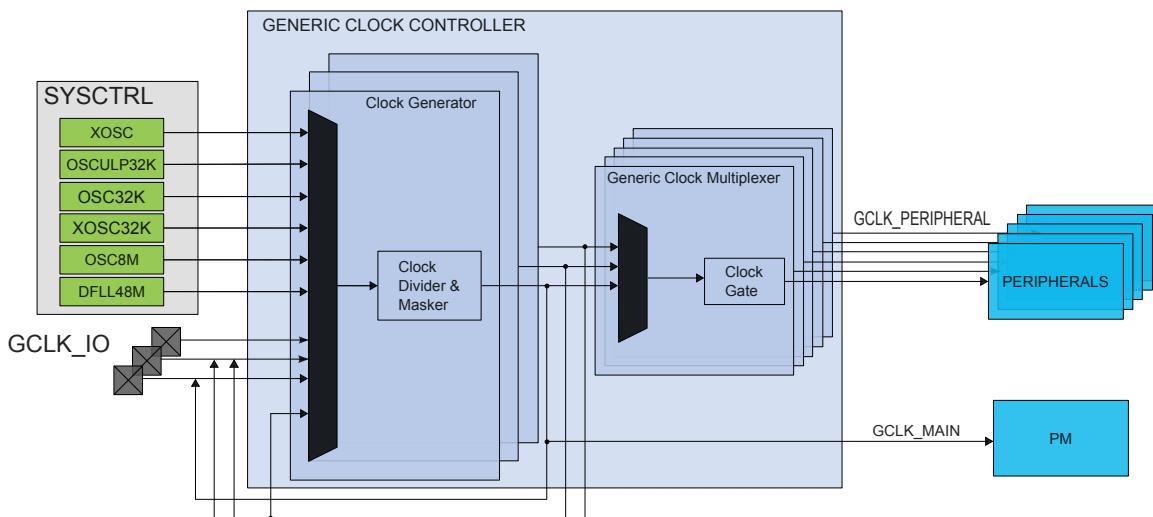

### 15.2. Features

- Provides Generic Clocks
- Wide frequency range
- Clock source for the generator can be changed on the fly

### 15.3. Block Diagram

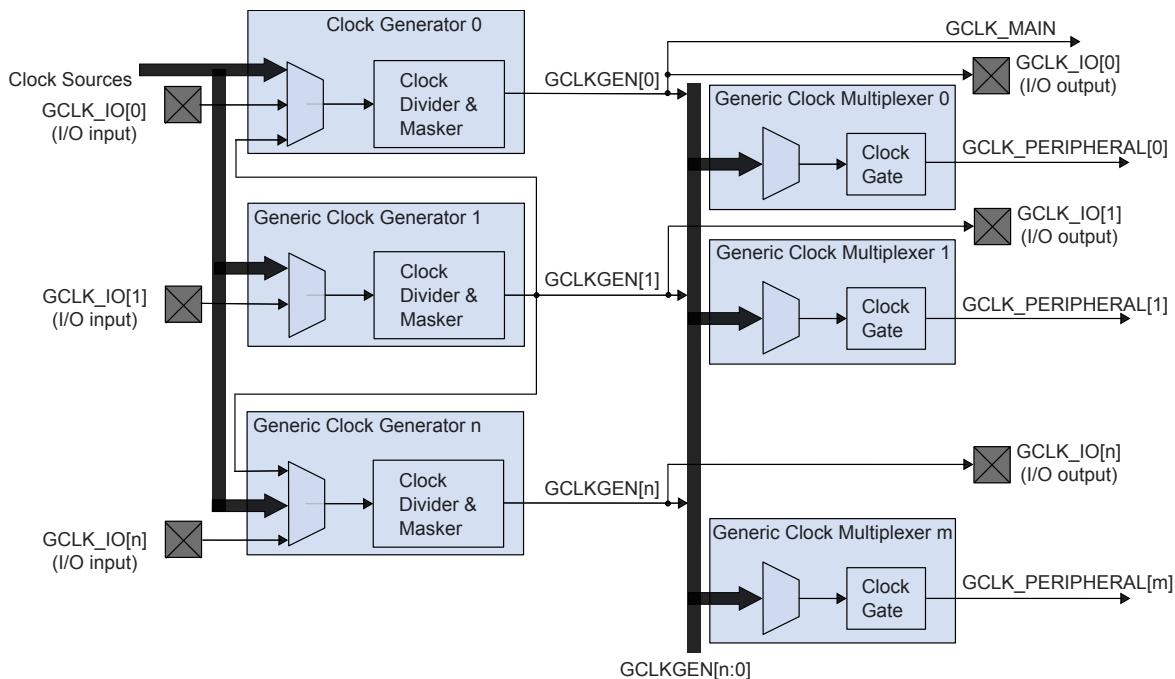

The generation of Peripheral Clock signals (GCLK\_PERIPHERAL) and the Main Clock (GCLK\_MAIN) can be seen in the figure below.

Figure 15-1. Device Clocking Diagram

The GCLK block diagram is shown in the next figure.

**Figure 15-2. Generic Clock Controller Block Diagram<sup>(1)</sup>**

**Note:** 1. If GENCTRL.SRC=0x01(GCLKIN), the GCLK\_IO is set as an input.

## 15.4. Signal Description

**Table 15-1. Signal Description**

Signal Name	Type	Description
GCLK_IO[7:0]	Digital I/O	Clock source for Generators when input Generic Clock signal when output

Refer to PORT Function Multiplexing table in I/O Multiplexing and Considerations for details on the pin mapping for this peripheral.

**Note:** One signal can be mapped on several pins.

#### **15.5.7. Register Access Protection**

All registers with write-access can be optionally write-protected by the Peripheral Access Controller (PAC).

**Note:** Optional write-protection is indicated by the "PAC Write-Protection" property in the register description.

When the CPU is halted in debug mode, all write-protection is automatically disabled. Write-protection does not apply for accesses through an external debugger.

[PAC - Peripheral Access Controller](#) on page 45

#### **15.5.8. Analog Connections**

Not applicable.

### **15.6. Functional Description**

#### **15.6.1. Principle of Operation**

The GCLK module is comprised of eight Generic Clock Generators (Generators) sourcing m Generic Clock Multiplexers.

A clock source selected as input to a Generator can either be used directly, or it can be prescaled in the Generator. A generator output is used as input to one or more the Generic Clock Multiplexers to provide a peripheral (GCLK\_PERIPHERAL). A generic clock can act as the clock to one or several of peripherals.

## 15.6.2. Basic Operation

### 15.6.2.1. Initialization

Before a Generator is enabled, the corresponding clock source should be enabled. The Peripheral clock must be configured as outlined by the following steps:

1. The Generic Clock Generator division factor must be set by performing a single 32-bit write to the Generic Clock Generator Division register (GENDIV):
  - The Generic Clock Generator that will be selected as the source of the generic clock by setting the ID bit group (GENDIV.ID).
  - The division factor must be selected by the DIV bit group (GENDIV.DIV)  
**Note:** Refer to *Generic Clock Generator Division register (GENDIV)* for details.
2. The generic clock generator must be enabled by performing a single 32-bit write to the Generic Clock Generator Control register (GENCTRL):
  - The Generic Clock Generator will be selected as the source of the generic clock by the ID bit group (GENCTRL.ID)
  - The Generic Clock generator must be enabled (GENCTRL.GENEN=1)  
**Note:** Refer to *Generic Clock Generator Control register (GENCTRL)* for details.
3. The generic clock must be configured by performing a single 16-bit write to the Generic Clock Control register (CLKCTRL):
  - The Generic Clock that will be configured via the ID bit group (CLKCTRL.ID)
  - The Generic Clock Generator used as the source of the generic clock by writing the GEN bit group (CLKCTRL.GEN)  
**Note:** Refer to *Generic Clock Control register (CLKCTRL)* for details.

[GENDIV](#) on page 126

### 15.6.2.2. Enabling, Disabling and Resetting

The GCLK module has no enable/disable bit to enable or disable the whole module.

The GCLK is reset by setting the Software Reset bit in the Control register (CTRL.SWRST) to 1. All registers in the GCLK will be reset to their initial state, except for Generic Clocks Multiplexer and associated Generators that have their Write Lock bit set to 1 (CLKCTRL.WRTLOCK). For further details, refer to [Configuration Lock](#).

### 15.6.2.3. Generic Clock Generator

Each Generator (GCLK\_GEN) can be set to run from one of eight different clock sources except GCLKGEN[1], which can be set to run from one of seven sources. GCLKGEN[1] is the only Generator that can be selected as source to other Generators but can not act as source to itself.

Each generator GCLKGEN[x] can be connected to one specific pin GCLK\_IO[x]. The GCLK\_IO[x] can be set to act as source to GCLKGEN[x] or GCLK\_IO[x] can be set up to output the clock generated by GCLKGEN[x].

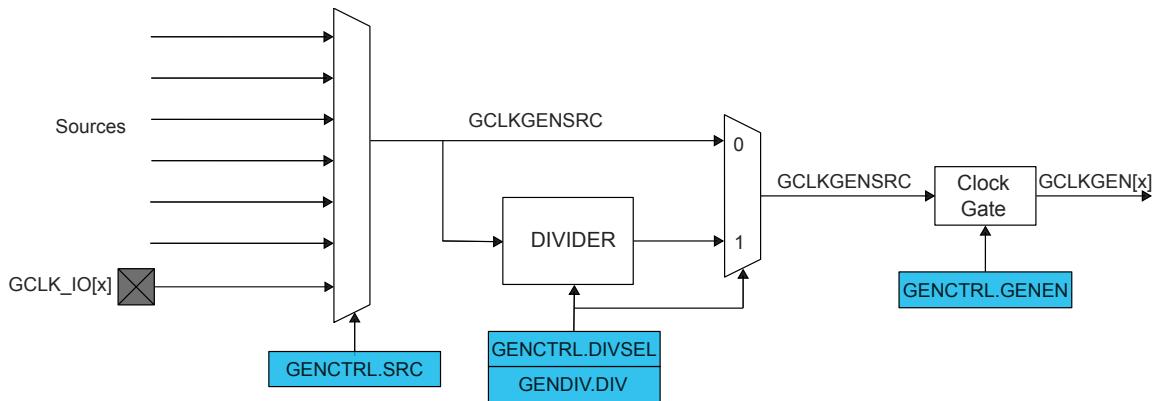

The selected source can be divided. Each Generator can be enabled or disabled independently.

Each GCLKGEN clock signal can then be used as clock source for Generic Clock Multiplexers. Each Generator output is allocated to one or several Peripherals.

GCLKGEN[0], is used as GCLK\_MAIN for the synchronous clock controller inside the Power Manager.

Refer to *PM-Power Manager* for details on the synchronous clock generation.

**Figure 15-3. Generic Clock Generator**

#### Related Links

[PM – Power Manager](#) on page 129

##### 15.6.2.4. Enabling a Generic Clock Generator

A Generator is enabled by setting the Generic Clock Generator Enable bit in the Generic Clock Generator Control register (GENCTRL.GENEN=1).

##### 15.6.2.5. Disabling a Generic Clock Generator

A Generator is disabled by clearing GENCTRL.GENEN. When GENCTRL.GENEN=0, the GCLKGEN clock is disabled and clock gated.

##### 15.6.2.6. Selecting a Clock Source for the Generic Clock Generator

Each Generator can individually select a clock source by setting the Source Select bit group in GENCTRL (GENCTRL.SRC).

Changing from one clock source, for example A, to another clock source, B, can be done on the fly: If clock source B is not ready, the Generator will continue running with clock source A. As soon as clock source B is ready, however, the generic clock generator will switch to it. During the switching operation, the Generator holds clock requests to clock sources A and B and then releases the clock source A request when the switch is done.

The available clock sources are device dependent (usually the crystal oscillators, RC oscillators, PLL and DFLL). Only GCLKGEN[1] can be used as a common source for all other generators except Generator 1.

##### 15.6.2.7. Changing Clock Frequency

The selected source (GENCLKSRC) for a Generator can be divided by writing a division value in the Division Factor bit group in the Generic Clock Generator Division register (GENDIV.DIV). How the actual division factor is calculated is depending on the Divide Selection bit in GENCTRL (GENCTRL.DIVSEL), it can be interpreted in two ways by the integer divider.

**Note:** The number of DIV bits for each Generator is device dependent.

#### Related Links

[GENDIV](#) on page 126

[GENCTRL](#) on page 122

##### 15.6.2.8. Duty Cycle

When dividing a clock with an odd division factor, the duty-cycle will not be 50/50. Writing the Improve Duty Cycle bit in GENCTRL (GENCTRL.IDC=1) will result in a 50/50 duty cycle.

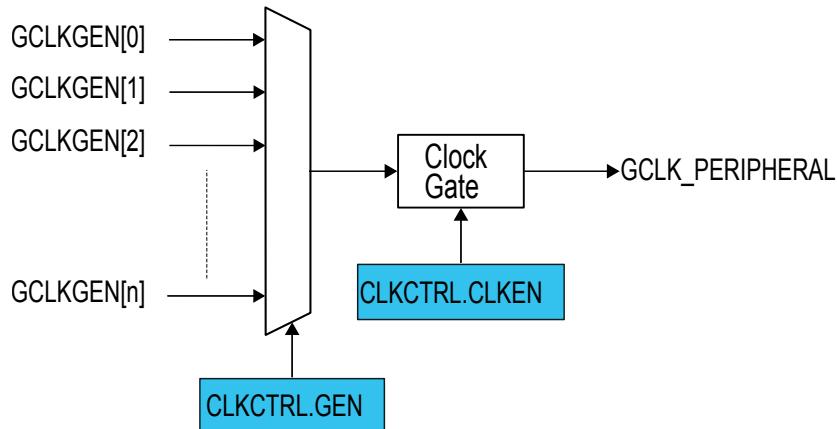

#### 15.6.2.9. Generic Clock Output on I/O Pins

Each Generator's output can be directed to a GCLK\_IO pin. If the Output Enable bit in GENCTRL is '1' (GENCTRL.OE=1) and the Generator is enabled (GENCTRL.GENEN=1), the Generator requests its clock source and the GCLKGEN clock is output to a GCLK\_IO pin. If GENCTRL.OE=0, GCLK\_IO is set according to the Output Off Value bit. If the Output Off Value bit in GENCTRL (GENCTRL.OOV) is zero, the output clock will be low when generic clock generator is turned off. If GENCTRL.OOV=1, the output clock will be high when Generator is turned off.

In standby mode, if the clock is output (GENCTRL.OE=1), the clock on the GCLK\_IO pin is frozen to the OOV value if the Run In Standby bit in GENCTRL (GENCTRL.RUNSTDBY) is zero. If GENCTRL.RUNSTDBY=1, the GCLKGEN clock is kept running and output to GCLK\_IO.

#### 15.6.3. Generic Clock

Figure 15-4. Generic Clock Multiplexer

##### 15.6.3.1. Enabling a Generic Clock

Before a generic clock is enabled, one of the Generators must be selected as the source for the generic clock by writing to CLKCTRL.GEN. The clock source selection is individually set for each generic clock.

When a Generator has been selected, the generic clock is enabled by setting the Clock Enable bit in CLKCTRL (CLKCTRL.CLKEN=1). The CLKCTRL.CLKEN bit must be synchronized to the generic clock domain. CLKCTRL.CLKEN will continue to read as its previous state until the synchronization is complete.

##### 15.6.3.2. Disabling a Generic Clock

A generic clock is disabled by writing CLKCTRL.CLKEN=0. The SYNCBUSY bit will be cleared when this write-synchronization is complete. CLKCTRL.CLKEN will stay in its previous state until the synchronization is complete. The generic clock is gated when disabled.

##### 15.6.3.3. Selecting a Clock Source for the Generic Clock

When changing a generic clock source by writing to CLKCTRL.GEN, the generic clock must be disabled before being re-enabled it with the new clock source setting. This prevents glitches during the transition:

1. Write CLKCTRL.CLKEN=0
2. Assert that CLKCTRL.CLKEN reads '0'
3. Change the source of the generic clock by writing CLKCTRL.GEN
4. Re-enable the generic clock by writing CLKCTRL.CLKEN=1

##### 15.6.3.4. Configuration Lock

The generic clock configuration can be locked for further write accesses by setting the Write Lock bit in the CLKCTRL register (CLKCTRL.WRTLOCK). All writes to the CLKCTRL register will be ignored. It can only be unlocked by a Power Reset.

The Generator source of a locked generic clock are also locked, too: The corresponding GENCTRL and GENDIV are locked, and can be unlocked only by a Power Reset.

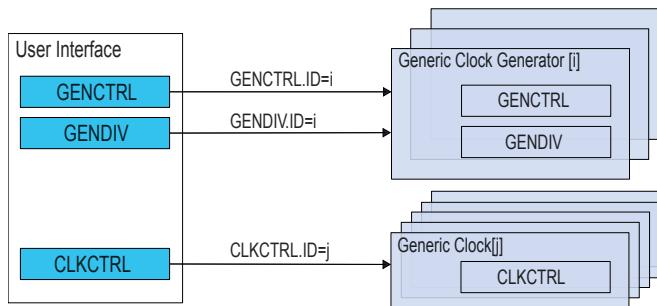

There is one exception concerning the GCLKGEN[0]. As it is used as GCLK\_MAIN, it can not be locked. It is reset by any Reset and will start up in a known configuration. The software reset (CTRL.SWRST) can not unlock the registers.

#### 15.6.4. Additional Features

##### 15.6.4.1. Indirect Access

The Generic Clock Generator Control and Division registers (GENCTRL and GENDIV) and the Generic Clock Control register (CLKCTRL) are indirectly addressed as shown in the next figure.

Figure 15-5. GCLK Indirect Access

Writing these registers is done by setting the corresponding ID bit group. To read a register, the user must write the ID of the channel,  $i$ , in the corresponding register. The value of the register for the corresponding ID is available in the user interface by a read access.

For example, the sequence to read the GENCTRL register of generic clock generator  $i$  is:

1. Do an 8-bit write of the  $i$  value to GENCTRL.ID
2. Read the value of GENCTRL

##### 15.6.4.2. Generic Clock Enable after Reset

The Generic Clock Controller must be able to provide a generic clock to some specific peripherals after a reset. That means that the configuration of the Generators and generic clocks after Reset is device-dependent.

Refer to *GENCTRL.ID* for details on GENCTRL reset.

Refer to *GENDIV.ID* for details on GENDIV reset.

Refer to *CLKCTRL.ID* for details on CLKCTRL reset.

#### Related Links

[CLKCTRL](#) on page 119

[GENCTRL](#) on page 122

[GENDIV](#) on page 126

#### 15.6.5. Sleep Mode Operation

##### 15.6.5.1. Sleep Walking

The GCLK module supports the Sleep Walking feature. If the system is in a sleep mode where the Generic Clocks are stopped, a peripheral that needs its clock in order to execute a process must request it from the Generic Clock Controller.

The Generic Clock Controller receives this request, determines which Generic Clock Generator is involved and which clock source needs to be awakened. It then wakes up the respective clock source, enables the Generator and generic clock stages successively, and delivers the clock to the peripheral.

#### 15.6.5.2. Run in Standby Mode

In standby mode, the GCLK can continuously output the generator output to GCLK\_IO.

When set, the GCLK can continuously output the generator output to GCLK\_IO.

Refer to [Generic Clock Output on I/O Pins](#) for details.

#### 15.6.6. Synchronization

Due to asynchronicity between the main clock domain and the peripheral clock domains, some registers need to be synchronized when written or read.

When executing an operation that requires synchronization, the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY) will be set immediately, and cleared when synchronization is complete.

If an operation that requires synchronization is executed while STATUS.SYNCBUSY=1, the bus will be stalled. All operations will complete successfully, but the CPU will be stalled and interrupts will be pending as long as the bus is stalled.

The following registers are synchronized when written:

- Generic Clock Generator Control register (GENCTRL)
- Generic Clock Generator Division register (GENDIV)
- Control register (CTRL)

Required write-synchronization is denoted by the "Write-Synchronized" property in the register description.

0xA		23:16					DIV[15:8]				
0xB		31:24									

## 15.8. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16-, and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers require synchronization when read and/or written. Synchronization is denoted by the "Read-Synchronized" and/or "Write-Synchronized" property in each individual register description.

Refer to [Register Access Protection](#) for details.

Some registers are enable-protected, meaning they can only be written when the module is disabled. Enable-protection is denoted by the "Enable-Protected" property in each individual register description.

Refer to [Synchronization](#) for details.

### 15.8.1. Control

**Name:** CTRL

**Offset:** 0x0

**Reset:** 0x00

**Property:** Write-Protected, Write-Synchronized

Bit	7	6	5	4	3	2	1	0	
									SWRST
Access									R/W

Reset 0

#### Bit 0 – SWRST: Software Reset

Writing a zero to this bit has no effect.

Writing a one to this bit resets all registers in the GCLK to their initial state after a power reset, except for generic clocks and associated generators that have their WRTLOCK bit in CLKCTRL read as one.

Refer to *GENCTRL.ID* for details on GENCTRL reset.

Refer to *GENDIV.ID* for details on GENDIV reset.

Refer to *CLKCTRL.ID* for details on CLKCTRL reset.

Due to synchronization, there is a delay from writing CTRL.SWRST until the reset is complete. CTRL.SWRST and STATUS.SYNCBUSY will both be cleared when the reset is complete.

Value	Description
0	There is no reset operation ongoing.
1	There is a reset operation ongoing.

### 15.8.2. Status

**Name:** STATUS

**Offset:** 0x1

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0
	SYNCBUSY							
Access	R							
Reset	0							

#### Bit 7 – SYNCBUSY: Synchronization Busy Status

This bit is cleared when the synchronization of registers between the clock domains is complete.

This bit is set when the synchronization of registers between clock domains is started.

### 15.8.3. Generic Clock Control

**Name:** CLKCTRL  
**Offset:** 0x2  
**Reset:** 0x0000  
**Property:** Write-Protected

Bit	15	14	13	12	11	10	9	8
	WRTLOCK	CLKEN					GEN[3:0]	
Access	R/W	R/W			R/W	R/W	R/W	R/W
Reset	0	0			0	0	0	0
Bit	7	6	5	4	3	2	1	0
					ID[5:0]			
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

#### Bit 15 – WRTLOCK: Write Lock

When this bit is written, it will lock from further writes the generic clock pointed to by CLKCTRL.ID, the generic clock generator pointed to in CLKCTRL.GEN and the division factor used in the generic clock generator. It can only be unlocked by a power reset.

One exception to this is generic clock generator 0, which cannot be locked.

Value	Description
0	The generic clock and the associated generic clock generator and division factor are not locked.
1	The generic clock and the associated generic clock generator and division factor are locked.

#### Bit 14 – CLKEN: Clock Enable

This bit is used to enable and disable a generic clock.

Value	Description
0	The generic clock is disabled.
1	The generic clock is enabled.

#### Bits 11:8 – GEN[3:0]: Generic Clock Generator

Table 15-3. Generic Clock Generator

GEN[3:0]	Name	Description
0x0	GCLKGEN0	Generic clock generator 0
0x1	GCLKGEN1	Generic clock generator 1
0x2	GCLKGEN2	Generic clock generator 2
0x3	GCLKGEN3	Generic clock generator 3
0x4	GCLKGEN4	Generic clock generator 4
0x5	GCLKGEN5	Generic clock generator 5

GEN[3:0]	Name	Description
0x6	GCLKGEN6	Generic clock generator 6
0x7	GCLKGEN7	Generic clock generator 7
0x8-0xF	Reserved	Reserved

#### Bits 5:0 – ID[5:0]: Generic Clock Selection ID

These bits select the generic clock that will be configured. The value of the ID bit group versus module instance is shown in the table below.

A power reset will reset the CLKCTRL register for all IDs, including the RTC. If the WRTLOCK bit of the corresponding ID is zero and the ID is not the RTC, a user reset will reset the CLKCTRL register for this ID.

After a power reset, the reset value of the CLKCTRL register versus module instance is as shown in the next table.

Table 15-4. Generic Clock Selection ID and CLKCTRL value after Power Reset

Module Instance	Reset Value after Power Reset		
	CLKCTRL.GEN	CLKCTRL.CLKEN	CLKCTRL.WRTLOCK
RTC	0x00	0x00	0x00
WDT	0x02	0x01 if WDT Enable bit in NVM User Row written to one 0x00 if WDT Enable bit in NVM User Row written to zero	0x01 if WDT Always-On bit in NVM User Row written to one 0x00 if WDT Always-On bit in NVM User Row written to zero
Others	0x00	0x00	0x00

After a user reset, the reset value of the CLKCTRL register versus module instance is as shown in the table below.

Table 15-5. Generic Clock Selection ID and CLKCTRL Value after User Reset

Module Instance	Reset Value after a User Reset		
	CLKCTRL.GEN	CLCTRL.CLKEN	CLKCTRL.WRTLOCK
RTC	0x00 if WRTLOCK=0 and CLKEN=0 No change if WRTLOCK=1 or CLKEN=1	0x00 if WRTLOCK=0 and CLKEN=0 No change if WRTLOCK=1 or CLKEN=1	No change
WDT	0x02 if WRTLOCK=0 No change if WRTLOCK=1	If WRTLOCK=0 0x01 if WDT Enable bit in NVM User Row written to one 0x00 if WDT Enable bit in NVM User Row written to zero If WRTLOCK=1 no change	No change
Others	0x00 if WRTLOCK=0 No change if WRTLOCK=1	0x00 if WRTLOCK=0 No change if WRTLOCK=1	No change

Value	Name	Description
0x00	GCLK_DFLL48M_REF	DFLL48M Reference
0x01	GCLK_WDT	WDT
0x02	GCLK_RTC	RTC
0x03	GCLK_EIC	EIC
0x04	GCLK_EVSYS_CHANNEL_0	EVSYS_CHANNEL_0
0x05	GCLK_EVSYS_CHANNEL_1	EVSYS_CHANNEL_1
0x06	GCLK_EVSYS_CHANNEL_2	EVSYS_CHANNEL_2
0x07	GCLK_EVSYS_CHANNEL_3	EVSYS_CHANNEL_3
0x08	GCLK_EVSYS_CHANNEL_4	EVSYS_CHANNEL_4
0x09	GCLK_EVSYS_CHANNEL_5	EVSYS_CHANNEL_5
0x0A	GCLK_EVSYS_CHANNEL_6	EVSYS_CHANNEL_6
0x0B	GCLK_EVSYS_CHANNEL_7	EVSYS_CHANNEL_7
0x0C	GCLK_SERCOMx_SLOW	SERCOMx_SLOW
0x0D	GCLK_SERCOM0_CORE	SERCOM0_CORE
0x0E	GCLK_SERCOM1_CORE	SERCOM1_CORE
0x0F	GCLK_SERCOM2_CORE	SERCOM2_CORE
0x10	GCLK_SERCOM3_CORE	SERCOM3_CORE
0x11	GCLK_SERCOM4_CORE	SERCOM4_CORE
0x12	GCLK_SERCOM5_CORE	SERCOM5_CORE
0x13	GCLK_TC0, GCLK_TC1	TC0, TC1
0x14	GCLK_TC2, GCLK_TC3	TC2, TC3
0x15	GCLK_TC4, GCLK_TC5	TC4, TC5
0x16	GCLK_TC6, GCLK_TC7	TC6, TC7
0x17	GCLK_ADC	ADC
0x18	GCLK_AC_DIG	AC_DIG
0x19	GCLK_AC_ANA	AC_ANA
0x1A	GCLK_DAC	DAC
0x1B	GCLK_PTC	PTC
0x1C-0x3F	-	Reserved

#### 15.8.4. Generic Clock Generator Control

**Name:** GENCTRL  
**Offset:** 0x4  
**Reset:** 0x00000000  
**Property:** Write-Protected, Write-Synchronized

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access				R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access				R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0

##### Bit 21 – RUNSTDBY: Run in Standby

This bit is used to keep the generic clock generator running when it is configured to be output to its dedicated GCLK\_IO pin. If GENCTRL.OE is zero, this bit has no effect and the generic clock generator will only be running if a peripheral requires the clock.

Value	Description
0	The generic clock generator is stopped in standby and the GCLK_IO pin state (one or zero) will be dependent on the setting in GENCTRL.OOV.
1	The generic clock generator is kept running and output to its dedicated GCLK_IO pin during standby mode.

##### Bit 20 – DIVSEL: Divide Selection

This bit is used to decide how the clock source used by the generic clock generator will be divided. If the clock source should not be divided, the DIVSEL bit must be zero and the GENDIV.DIV value for the corresponding generic clock generator must be zero or one.

Value	Description
0	The generic clock generator equals the clock source divided by GENDIV.DIV.
1	The generic clock generator equals the clock source divided by $2^{(GENDIV.DIV+1)}$ .

**Bit 19 – OE: Output Enable**

This bit is used to enable output of the generated clock to GCLK\_IO when GCLK\_IO is not selected as a source in the GENCLK.SRC bit group.

Value	Description
0	The generic clock generator is not output.
1	The generic clock generator is output to the corresponding GCLK_IO, unless the corresponding GCLK_IO is selected as a source in the GENCLK.SRC bit group.

**Bit 18 – OOV: Output Off Value**

This bit is used to control the value of GCLK\_IO when GCLK\_IO is not selected as a source in the GENCLK.SRC bit group.

Value	Description
0	The GCLK_IO will be zero when the generic clock generator is turned off or when the OE bit is zero.
1	The GCLK_IO will be one when the generic clock generator is turned off or when the OE bit is zero.

**Bit 17 – IDC: Improve Duty Cycle**

This bit is used to improve the duty cycle of the generic clock generator when odd division factors are used.

Value	Description
0	The generic clock generator duty cycle is not 50/50 for odd division factors.
1	The generic clock generator duty cycle is 50/50.

**Bit 16 – GENEN: Generic Clock Generator Enable**

This bit is used to enable and disable the generic clock generator.

Value	Description
0	The generic clock generator is disabled.
1	The generic clock generator is enabled.

**Bits 12:8 – SRC[4:0]: Source Select**

These bits define the clock source to be used as the source for the generic clock generator, as shown in the table below.

Value	Name	Description
0x00	XOSC	XOSC oscillator output
0x01	GCLKIN	Generator input pad
0x02	GCLKGEN1	Generic clock generator 1 output
0x03	OSCULP32K	OSCULP32K oscillator output
0x04	OSC32K	OSC32K oscillator output
0x05	XOSC32K	XOSC32K oscillator output

Value	Name	Description
0x06	OSC8M	OSC8M oscillator output
0x07	DFLL48M	DFLL48M output
0x08-0xF	Reserved	Reserved for future use

#### Bits 3:0 – ID[3:0]: Generic Clock Generator Selection

These bits select the generic clock generator that will be configured or read. The value of the ID bit group versus which generic clock generator is configured is shown in the next table.

A power reset will reset the GENCTRL register for all IDs, including the generic clock generator used by the RTC. If a generic clock generator ID other than generic clock generator 0 is not a source of a “locked” generic clock or a source of the RTC generic clock, a user reset will reset the GENCTRL for this ID.

Values	Names	Description
0x0	GCLKGEN0	Generic clock generator 0
0x1	GCLKGEN0	Generic clock generator 0
0x2	GCLKGEN0	Generic clock generator 0
0x3	GCLKGEN0	Generic clock generator 0
0x4	GCLKGEN0	Generic clock generator 0
0x5	GCLKGEN0	Generic clock generator 0
0x6	GCLKGEN0	Generic clock generator 0
0x7	GCLKGEN0	Generic clock generator 0
0x8-0xF	-	Reserved for future use

After a power reset, the reset value of the GENCTRL register is as shown in the next table.

GCLK Generator ID	Reset Value after a Power Reset
0x00	0x00010600
0x01	0x00000001
0x02	0x00010302
0x03	0x00000003
0x04	0x00000004
0x05	0x00000005
0x06	0x00000006
0x07	0x00000007

After a user reset, the reset value of the GENCTRL register is as shown in the table below.

<b>GCLK Generator ID</b>	<b>Reset Value after a User Reset</b>
0x00	0x00010600
0x01	0x00000001 if the generator is not used by the RTC and not a source of a 'locked' generic clock No change if the generator is used by the RTC or used by a GCLK with a WRTLOCK as one
0x02	0x00010302 if the generator is not used by the RTC and not a source of a 'locked' generic clock No change if the generator is used by the RTC or used by a GCLK with a WRTLOCK as one
0x03	0x00000003 if the generator is not used by the RTC and not a source of a 'locked' generic clock No change if the generator is used by the RTC or used by a GCLK with a WRTLOCK as one
0x04	0x00000004 if the generator is not used by the RTC and not a source of a 'locked' generic clock No change if the generator is used by the RTC or used by a GCLK with a WRTLOCK as one
0x05	0x00000005 if the generator is not used by the RTC and not a source of a 'locked' generic clock No change if the generator is used by the RTC or used by a GCLK with a WRTLOCK as one
0x06	0x00000006 if the generator is not used by the RTC and not a source of a 'locked' generic clock No change if the generator is used by the RTC or used by a GCLK with a WRTLOCK as one
0x07	0x00000007 if the generator is not used by the RTC and not a source of a 'locked' generic clock No change if the generator is used by the RTC or used by a GCLK with a WRTLOCK as one

### 15.8.5. Generic Clock Generator Division

**Name:** GENDIV  
**Offset:** 0x8  
**Reset:** 0x00000000  
**Property:** -

Bit	7	6	5	4	3	2	1	0
ID[3:0]								
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

#### Bits 23:8 – DIV[15:0]: Division Factor

These bits apply a division on each selected generic clock generator. The number of DIV bits each generator has can be seen in the next table. Writes to bits above the specified number will be ignored.

Generator	Division Factor Bits
Generic clock generator 0	8 division factor bits - DIV[7:0]
Generic clock generator 1	16 division factor bits - DIV[15:0]
Generic clock generators 2	5 division factor bits - DIV[4:0]
Generic clock generators 3 - 8	8 division factor bits - DIV[7:0]

#### Bits 3:0 – ID[3:0]: Generic Clock Generator Selection

These bits select the generic clock generator on which the division factor will be applied, as shown in the table below.

Values	Description
0x0	Generic clock generator 0
0x1	Generic clock generator 1
0x2	Generic clock generator 2
0x3	Generic clock generator 3

Values	Description
0x4	Generic clock generator 4
0x5	Generic clock generator 5
0x6	Generic clock generator 6
0x7	Generic clock generator 7
0x8-0xF	Reserved

A power reset will reset the GENDIV register for all IDs, including the generic clock generator used by the RTC. If a generic clock generator ID other than generic clock generator 0 is not a source of a "locked" generic clock or a source of the RTC generic clock, a user reset will reset the GENDIV for this ID.

After a power reset, the reset value of the GENDIV register is as shown in the next table.

GCLK Generator ID	Reset Value after a Power Reset
0x00	0x00000000
0x01	0x00000001
0x02	0x00000002
0x03	0x00000003
0x04	0x00000004
0x05	0x00000005
0x06	0x00000006
0x07	0x00000007

After a user reset, the reset value of the GENDIV register is as shown in next table.

GCLK Generator ID	Reset Value after a User Reset
0x00	0x00000000
0x01	0x00000001 if the generator is not used by the RTC and not a source of a 'locked' generic clock No change if the generator is used by the RTC or used by a GCLK with a WRTLOCK as one
0x02	0x00000002 if the generator is not used by the RTC and not a source of a 'locked' generic clock No change if the generator is used by the RTC or used by a GCLK with a WRTLOCK as one
0x03	0x00000003 if the generator is not used by the RTC and not a source of a 'locked' generic clock No change if the generator is used by the RTC or used by a GCLK with a WRTLOCK as one

<b>GCLK Generator ID</b>	<b>Reset Value after a User Reset</b>
0x04	0x00000004 if the generator is not used by the RTC and not a source of a 'locked' generic clock No change if the generator is used by the RTC or used by a GCLK with a WRTLOCK as one
0x05	0x00000005 if the generator is not used by the RTC and not a source of a 'locked' generic clock No change if the generator is used by the RTC or used by a GCLK with a WRTLOCK as one
0x06	0x00000006 if the generator is not used by the RTC and not a source of a 'locked' generic clock No change if the generator is used by the RTC or used by a GCLK with a WRTLOCK as one
0x07	0x00000007 if the generator is not used by the RTC and not a source of a 'locked' generic clock No change if the generator is used by the RTC or used by a GCLK with a WRTLOCK as one

## 16. PM – Power Manager

### 16.1. Overview

The Power Manager (PM) controls the reset, clock generation and sleep modes of the device.

Utilizing a main clock chosen from a large number of clock sources from the GCLK, the clock controller provides synchronous system clocks to the CPU and the modules connected to the AHB and the APBx bus. The synchronous system clocks are divided into a number of clock domains; one for the CPU and AHB and one for each APBx. Any synchronous system clock can be changed at run-time during normal operation. The clock domains can run at different speeds, enabling the user to save power by running peripherals at a relatively low clock frequency, while maintaining high CPU performance. In addition, the clock can be masked for individual modules, enabling the user to minimize power consumption. If for some reason the main clock stops oscillating, the clock failure detector allows switching the main clock to the safe OSC8M clock.

Before entering the STANDBY sleep mode the user must make sure that a significant amount of clocks and peripherals are disabled, so that the voltage regulator is not overloaded. This is because during STANDBY sleep mode the internal voltage regulator will be in low power mode.

Various sleep modes are provided in order to fit power consumption requirements. This enables the PM to stop unused modules in order to save power. In active mode, the CPU is executing application code. When the device enters a sleep mode, program execution is stopped and some modules and clock domains are automatically switched off by the PM according to the sleep mode. The application code decides which sleep mode to enter and when. Interrupts from enabled peripherals and all enabled reset sources can restore the device from a sleep mode to active mode.

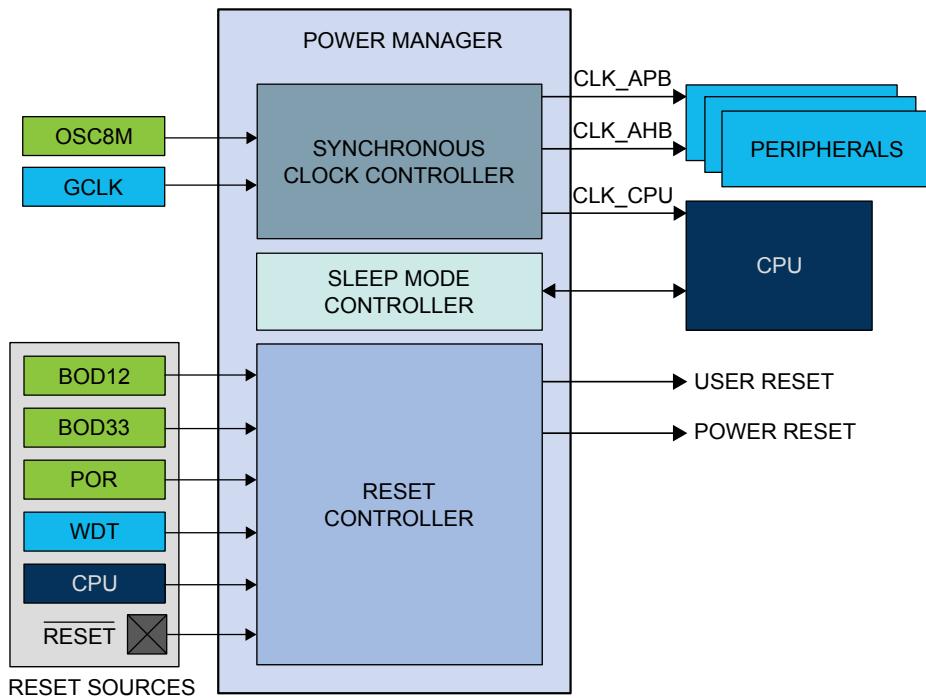

The PM also contains a reset controller to collect all possible reset sources. It issues a device reset and sets the device to its initial state, and allows the reset source to be identified by software.

### 16.2. Features

- Reset control
  - Reset the microcontroller and set it to an initial state according to the reset source
  - Multiple reset sources
    - Power reset sources: POR, BOD12, BOD33
    - User reset sources: External reset (RESET), Watchdog Timer reset, software reset
  - Reset status register for reading the reset source from the application code
- Clock control
  - Controls CPU, AHB and APB system clocks
    - Multiple clock sources and division factor from GCLK
    - Clock prescaler with 1x to 128x division
  - Safe run-time clock switching from GCLK
  - Module-level clock gating through maskable peripheral clocks
  - Clock failure detector
- Power management control
  - Sleep modes: IDLE, STANDBY
  - SleepWalking support on GCLK clocks

## 16.3. Block Diagram

Figure 16-1. PM Block Diagram

## 16.4. Signal Description

Signal Name	Type	Description
RESET	Digital input	External reset

Refer to *I/O Multiplexing and Considerations* for details on the pin mapping for this peripheral. One signal can be mapped on several pins.

### Related Links

[I/O Multiplexing and Considerations](#) on page 27

## 16.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly, as described below.

### 16.5.1. I/O Lines

Not applicable.

### 16.5.2. Power Management

Not applicable.

### 16.5.3. Clocks

The PM bus clock (CLK\_PM\_APB) can be enabled and disabled in the Power Manager, and the default state of CLK\_PM\_APB can be found in [Table 16-1 related to the Peripheral Clock Masking](#). If this clock is disabled in the Power Manager, it can only be re-enabled by a reset.

A generic clock (GCLK\_MAIN) is required to generate the main clock. The clock source for GCLK\_MAIN is configured by default in the Generic Clock Controller, and can be re-configured by the user if needed. Refer to *GCLK – Generic Clock Controller* for details.

#### Related Links

- [Peripheral Clock Masking](#) on page 134
- [GCLK - Generic Clock Controller](#) on page 108

##### 16.5.3.1. Main Clock

The main clock (CLK\_MAIN) is the common source for the synchronous clocks. This is fed into the common 8-bit prescaler that is used to generate synchronous clocks to the CPU, AHB and APBx modules.

##### 16.5.3.2. CPU Clock

The CPU clock (CLK\_CPU) is routed to the CPU. Halting the CPU clock inhibits the CPU from executing instructions.

##### 16.5.3.3. AHB Clock

The AHB clock (CLK\_AHB) is the root clock source used by peripherals requiring an AHB clock. The AHB clock is always synchronous to the CPU clock and has the same frequency, but may run even when the CPU clock is turned off. A clock gate is inserted from the common AHB clock to any AHB clock of a peripheral.

##### 16.5.3.4. APBx Clocks

The APBx clock (CLK\_APBX) is the root clock source used by modules requiring a clock on the APBx bus. The APBx clock is always synchronous to the CPU clock, but can be divided by a prescaler, and will run even when the CPU clock is turned off. A clock gater is inserted from the common APB clock to any APBx clock of a module on APBx bus.

##### 16.5.4. Interrupts

The interrupt request line is connected to the Interrupt Controller. Using the PM interrupt requires the Interrupt Controller to be configured first. Refer to *Nested Vector Interrupt Controller* for details.

#### Related Links

- [Nested Vector Interrupt Controller](#) on page 41

##### 16.5.5. Events

Not applicable.

##### 16.5.6. Debug Operation

When the CPU is halted in debug mode, the PM continues normal operation. In sleep mode, the clocks generated from the PM are kept running to allow the debugger accessing any modules. As a consequence, power measurements are not possible in debug mode.

##### 16.5.7. Register Access Protection

Registers with write-access can be optionally write-protected by the Peripheral Access Controller (PAC), except the following:

- Interrupt Flag register (INTFLAG).
- Reset Cause register (RCAUSE).

**Note:** Optional write-protection is indicated by the "PAC Write-Protection" property in the register description.

Write-protection does not apply for accesses through an external debugger. Refer to *PAC – Peripheral Access Controller* for details.

#### Related Links

[PAC - Peripheral Access Controller](#) on page 45

[INTFLAG](#) on page 160

[RCAUSE](#) on page 161

### 16.5.8. Analog Connections

Not applicable.

## 16.6. Functional Description

### 16.6.1. Principle of Operation

#### 16.6.1.1. Synchronous Clocks

The GCLK\_MAIN clock from GCLK module provides the source for the main clock, which is the common root for the synchronous clocks for the CPU and APBx modules. The main clock is divided by an 8-bit prescaler, and each of the derived clocks can run from any tapping off this prescaler or the undivided main clock, as long as  $f_{CPU} \geq f_{APBx}$ . The synchronous clock source can be changed on the fly to respond to varying load in the application. The clocks for each module in each synchronous clock domain can be individually masked to avoid power consumption in inactive modules. Depending on the sleep mode, some clock domains can be turned off (see [Table 16-4](#)).

#### 16.6.1.2. Reset Controller

The Reset Controller collects the various reset sources and generates reset for the device. The device contains a power-on-reset (POR) detector, which keeps the system reset until power is stable. This eliminates the need for external reset circuitry to guarantee stable operation when powering up the device.

#### 16.6.1.3. Sleep Mode Controller

In ACTIVE mode, all clock domains are active, allowing software execution and peripheral operation. The PM Sleep Mode Controller allows the user to choose between different sleep modes depending on application requirements, to save power (see [Table 16-4](#)).

### 16.6.2. Basic Operation

#### 16.6.2.1. Initialization

After a power-on reset, the PM is enabled and the Reset Cause register indicates the POR source (RCAUSE.POR). The default clock source of the GCLK\_MAIN clock is started and calibrated before the CPU starts running. The GCLK\_MAIN clock is selected as the main clock without any division on the prescaler. The device is in the ACTIVE mode.

By default, only the necessary clocks are enabled (see [Table 1](#)).

#### Related Links

[RCAUSE](#) on page 161

#### 16.6.2.2. Enabling, Disabling and Resetting

The PM module is always enabled and can not be reset.

#### 16.6.2.3. Selecting the Main Clock Source

Refer to *GCLK – Generic Clock Controller* for details on how to configure the main clock source.

## Related Links

[GCLK - Generic Clock Controller](#) on page 108

### 16.6.2.4. Selecting the Synchronous Clock Division Ratio

The main clock feeds an 8-bit prescaler, which can be used to generate the synchronous clocks. By default, the synchronous clocks run on the undivided main clock. The user can select a prescaler division for the CPU clock by writing the CPU Prescaler Selection bits in the CPU Select register (CPUSEL.CPUDIV), resulting in a CPU clock frequency determined by this equation:

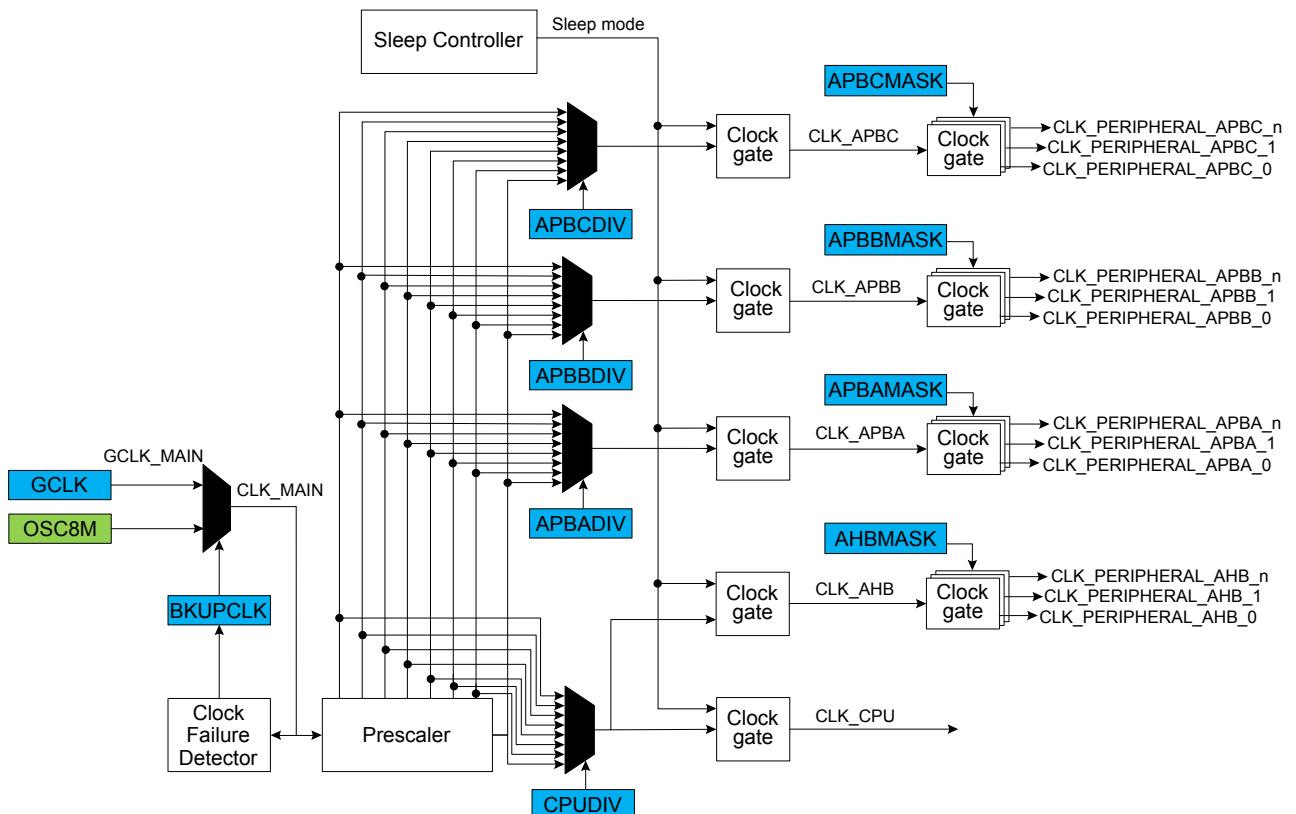

$$f_{CPU} = \frac{f_{main}}{2^{CPUDIV}}$$

Similarly, the clock for the APBx can be divided by writing their respective registers (APBxSEL.APBxDIV). To ensure correct operation, frequencies must be selected so that  $f_{CPU} \geq f_{APBx}$ . Also, frequencies must never exceed the specified maximum frequency for each clock domain.

**Note:** The AHB clock is always equal to the CPU clock.

CPUSEL and APBxSEL can be written without halting or disabling peripheral modules. Writing CPUSEL and APBxSEL allows a new clock setting to be written to all synchronous clocks at the same time. It is possible to keep one or more clocks unchanged. This way, it is possible to, for example, scale the CPU speed according to the required performance, while keeping the APBx frequency constant.

**Figure 16-2. Synchronous Clock Selection and Prescaler**

### 16.6.2.5. Clock Ready Flag

There is a slight delay from when CPUSEL and APBxSEL are written until the new clock setting becomes effective. During this interval, the Clock Ready flag in the Interrupt Flag Status and Clear register (INTFLAG.CKRDY) will read as zero. If CKRDY in the INTENSET register is written to one, the Power

Manager interrupt can be triggered when the new clock setting is effective. CPUSEL must not be re-written while CKRDY is zero, or the system may become unstable or hang.

#### Related Links

[CPUSEL](#) on page 144

[INTENSET](#) on page 159

#### 16.6.2.6. Peripheral Clock Masking

It is possible to disable or enable the clock for a peripheral in the AHB or APBx clock domain by writing the corresponding bit in the Clock Mask register (APBxMASK - refer to *APBAMASK* register for details) to zero or one. Refer to the table below for the default state of each of the peripheral clocks.

**Table 16-1. Peripheral Clock Default State**

Peripheral Clock	Default State
CLK_PAC0_APB	Enabled
CLK_PM_APB	Enabled
CLK_SYSCTRL_APB	Enabled
CLK_GCLK_APB	Enabled
CLK_WDT_APB	Enabled
CLK_RTC_APB	Enabled
CLK_EIC_APB	Enabled
CLK_PAC1_APB	Enabled
CLK_DSU_APB	Enabled
CLK_NVMCTRL_APB	Enabled
CLK_PORT_APB	Enabled
CLK_PAC2_APB	Disabled
CLK_SERCOMx_APB	Disabled
CLK_TCx_APB	Disabled
CLK_ADC_APB	Enabled
CLK_AC_APB	Disabled
CLK_DAC_APB	Disabled
CLK_PTC_APB	Disabled

When the APB clock for a module is not provided its registers cannot be read or written. The module can be re-enabled later by writing the corresponding mask bit to one.

A module may be connected to several clock domains (for instance, AHB and APB), in which case it will have several mask bits.

**Note:** Clocks should only be switched off if it is certain that the module will not be used. Switching off the clock for the NVM Controller (NVMCTRL) will cause a problem if the CPU needs to read from the flash memory. Switching off the clock to the Power Manager (PM), which contains the mask registers, or the

corresponding APBx bridge, will make it impossible to write the mask registers again. In this case, they can only be re-enabled by a system reset.

#### Related Links

[APBAMASK](#) on page 150

##### 16.6.2.7. Clock Failure Detector

This mechanism allows the main clock to be switched automatically to the safe OSC8M clock when the main clock source is considered off. This may happen for instance when an external crystal oscillator is selected as the clock source for the main clock and the crystal fails. The mechanism is designed to detect, during a OSCULP32K clock period, at least one rising edge of the main clock. If no rising edge is seen, the clock is considered failed.

The clock failure detector is enabled by writing a '1' to the Clock Failure Detector Enable bit in CTRL (CFDEN\_CTRL).

As soon as the Clock Failure Detector Enable bit (CTRL.CFDEN) is one, the clock failure detector (CFD) will monitor the undivided main clock. When a clock failure is detected, the main clock automatically switches to the OSC8M clock and the Clock Failure Detector flag in the interrupt Flag Status and Clear register (INTFLAG.CFD) is set and the corresponding interrupt request will be generated if enabled. The BKUPCLK bit in the CTRL register is set by hardware to indicate that the main clock comes from OSC8M. The GCLK\_MAIN clock source can be selected again by writing a zero to the CTRL.BKUPCLK bit. However, writing the bit does not fix the failure.

#### Note:

1. The detector does not monitor while the main clock is temporarily unavailable (start-up time after a wake-up, etc.) or in sleep mode. The Clock Failure Detector must be disabled before entering standby mode.
2. The clock failure detector must not be enabled if the source of the main clock is not significantly faster than the OSCULP32K clock. For instance, if GCLK\_MAIN is the internal 32kHz RC, then the clock failure detector must be disabled.
3. The OSC8M internal oscillator should be enabled to allow the main clock switching to the OSC8M clock.

#### Related Links

[CTRL](#) on page 142

##### 16.6.2.8. Reset Controller

The latest reset cause is available in RCAUSE, and can be read during the application boot sequence in order to determine proper action.

There are two groups of reset sources:

- Power Reset: Resets caused by an electrical issue.
- User Reset: Resets caused by the application.

The table below lists the parts of the device that are reset, depending on the reset type.

Table 16-2. Effects of the Different Reset Events

	Power Reset	User Reset	
	POR, BOD12, BOD33	External Reset	WDT Reset, SysResetReq
RTC All the 32kHz sources WDT with ALWAYSON feature Generic Clock with WRTLOCK feature	Y	N	N
Debug logic	Y	Y	N
Others	Y	Y	Y

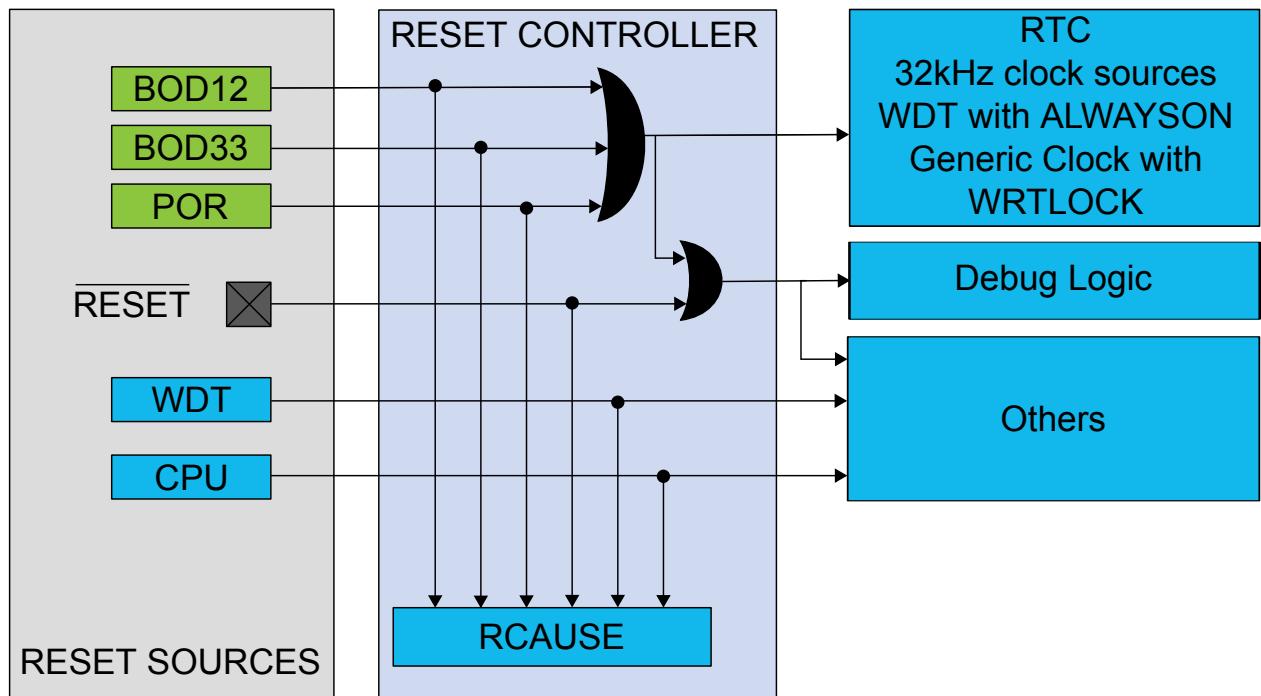

The external reset is generated when pulling the **RESET** pin low. This pin has an internal pull-up, and does not need to be driven externally during normal operation.

The POR, BOD12 and BOD33 reset sources are generated by their corresponding module in the System Controller Interface (SYSCTRL).

The WDT reset is generated by the Watchdog Timer.

The System Reset Request (SysResetReq) is a software reset generated by the CPU when asserting the SYSRESETREQ bit located in the Reset Control register of the CPU (See the ARM® Cortex® Technical Reference Manual on <http://www.arm.com>).

Figure 16-3. Reset Controller

### 16.6.2.9. Sleep Mode Controller

Sleep mode is activated by the Wait For Interrupt instruction (WFI). The Idle bits in the Sleep Mode register (SLEEP.IDLE) and the SLEEPDEEP bit of the System Control register of the CPU should be used as argument to select the level of the sleep mode.

There are two main types of sleep mode:

- IDLE mode: The CPU is stopped. Optionally, some synchronous clock domains are stopped, depending on the IDLE argument. Regulator operates in normal mode.
- STANDBY mode: All clock sources are stopped, except those where the RUNSTDBY bit is set. Regulator operates in low-power mode. Before entering standby mode the user must make sure that a significant amount of clocks and peripherals are disabled, so that the voltage regulator is not overloaded.

**Table 16-3. Sleep Mode Entry and Exit Table**

Mode	Level	Mode Entry	Wake-Up Sources
IDLE	0	SCR.SLEEPDEEP = 0 SLEEP.IDLE=Level WFI	Synchronous <sup>(2)</sup> (APB, AHB), asynchronous <sup>(1)</sup>
	1		Synchronous (APB), asynchronous
	2		Asynchronous
STANDBY		SCR.SLEEPDEEP = 1 WFI	Asynchronous

#### Note:

1. Asynchronous: interrupt generated on generic clock or external clock or external event.
2. Synchronous: interrupt generated on the APB clock.

**Table 16-4. Sleep Mode Overview**

Sleep Mode	CPU Clock	AHB Clock	APB Clock	Oscillators				Main Clock	Regulator Mode	RAM Mode			
				ONDEMAND = 0		ONDEMAND = 1							
				RUNSTDBY=0	RUNSTDBY=1	RUNSTDBY=0	RUNSTDBY=1						
Idle 0	Stop	Run	Run	Run	Run	Run if requested	Run if requested	Run	Normal	Normal			
Idle 1	Stop	Stop	Run	Run	Run	Run if requested	Run if requested	Run	Normal	Normal			
Idle 2	Stop	Stop	Stop	Run	Run	Run if requested	Run if requested	Run	Normal	Normal			
Standby	Stop	Stop	Stop	Stop	Run	Stop	Run if requested	Stop	Low power	Low power			

#### IDLE Mode

The IDLE modes allow power optimization with the fastest wake-up time.

The CPU is stopped. To further reduce power consumption, the user can disable the clocking of modules and clock sources by configuring the SLEEP.IDLE bit group. The module will be halted regardless of the bit settings of the mask registers in the Power Manager (PM.AHBMASK, PM.APBxMASK).

Regulator operates in normal mode.

- Entering IDLE mode: The IDLE mode is entered by executing the WFI instruction. Additionally, if the SLEEPONEXIT bit in the ARM Cortex System Control register (SCR) is set, the IDLE mode will also be entered when the CPU exits the lowest priority ISR. This mechanism can be useful for applications that only require the processor to run when an interrupt occurs. Before entering the IDLE mode, the user must configure the IDLE mode configuration bit group and must write a zero to the SCR.SLEEPDEEP bit.

- Exiting IDLE mode: The processor wakes the system up when it detects the occurrence of any interrupt that is not masked in the NVIC Controller with sufficient priority to cause exception entry. The system goes back to the ACTIVE mode. The CPU and affected modules are restarted.

#### **STANDBY Mode**

The STANDBY mode allows achieving very low power consumption.

In this mode, all clocks are stopped except those which are kept running if requested by a running module or have the ONDEMAND bit set to zero. For example, the RTC can operate in STANDBY mode. In this case, its Generic Clock clock source will also be enabled.

The regulator and the RAM operate in low-power mode.

A SLEEPONEXIT feature is also available.

- Entering STANDBY mode: This mode is entered by executing the WFI instruction with the SCR.SLEEPDEEP bit of the CPU is written to 1.
- Exiting STANDBY mode: Any peripheral able to generate an asynchronous interrupt can wake up the system. For example, a module running on a Generic clock can trigger an interrupt. When the enabled asynchronous wake-up event occurs and the system is woken up, the device will either execute the interrupt service routine or continue the normal program execution according to the Priority Mask Register (PRIMASK) configuration of the CPU.

#### **16.6.3. SleepWalking**

SleepWalking is the capability for a device to temporarily wake-up clocks for peripheral to perform a task without waking-up the CPU in STANDBY sleep mode. At the end of the sleepwalking task, the device can either be wakened-up by an interrupt (from a peripheral involved in SleepWalking) or enter again into STANDBY sleep mode.

In this device, SleepWalking is supported only on GCLK clocks by using the on-demand clock principle of the clock sources. Refer to *On-demand, Clock Requests* for more details.

#### **Related Links**

[On-demand, Clock Requests](#) on page 106

#### **16.6.4. Interrupts**

The peripheral has the following interrupt sources:

- Clock Ready flag
- Clock failure detector

Each interrupt source has an interrupt flag associated with it. The interrupt flag in the Interrupt Flag Status and Clear (INTFLAG) register is set when the interrupt condition occurs. Each interrupt can be individually enabled by writing a one to the corresponding bit in the Interrupt Enable Set (INTENSET) register, and disabled by writing a one to the corresponding bit in the Interrupt Enable Clear (INTENCLR) register. An interrupt request is generated when the interrupt flag is set and the corresponding interrupt is enabled. The interrupt request remains active until the interrupt flag is cleared, the interrupt is disabled or the peripheral is reset. An interrupt flag is cleared by writing a one to the corresponding bit in the INTFLAG register. Each peripheral can have one interrupt request line per interrupt source or one common interrupt request line for all the interrupt sources. Refer to *Nested Vector Interrupt Controller* for details. If the peripheral has one common interrupt request line for all the interrupt sources, the user must read the INTFLAG register to determine which interrupt condition is present.

#### **Related Links**

[Nested Vector Interrupt Controller](#) on page 41

### **16.6.5. Events**

Not applicable.

### **16.6.6. Sleep Mode Operation**

In all IDLE sleep modes, the power manager is still running on the selected main clock.

In STANDBY sleep mode, the power manager is frozen and is able to go back to ACTIVE mode upon any asynchronous interrupt.

## 16.7. Register Summary

Offset	Name	Bit Pos.

## 16.8. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16-, and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Exception for APBASEL, APBBSEL and APBCSEL: These registers must only be accessed with 8-bit access.

Optional write-protection by the Peripheral Access Controller (PAC) is denoted by the "PAC Write-Protection" property in each individual register description.

### 16.8.1. Control

**Name:** CTRL  
**Offset:** 0x00  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
				BKUPCLK			CFDEN	
Access				R/W			R/W	
Reset				0			0	

#### Bit 4 – BKUPCLK: Backup Clock Select

This bit is set by hardware when a clock failure is detected.

Value	Description
0	The GCLK_MAIN clock is selected for the main clock.
1	The OSC8M backup clock is selected for the main clock.

#### Bit 2 – CFDEN: Clock Failure Detector Enable

This bit is set by hardware when a clock failure is detected.

Value	Description
0	The clock failure detector is disabled.
1	The clock failure detector is enabled.

### 16.8.2. Sleep Mode

**Name:** SLEEP  
**Offset:** 0x01  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
							IDLE[1:0]	
Access							R/W	R/W
Reset							0	0

#### Bits 1:0 – IDLE[1:0]: Idle Mode Configuration

These bits select the Idle mode configuration after a WFI instruction.

IDLE[1:0]	Name	Description
0x0	CPU	The CPU clock domain is stopped
0x1	AHB	The CPU and AHB clock domains are stopped
0x2	APB	The CPU, AHB and APB clock domains are stopped
0x3		Reserved

### 16.8.3. CPU Clock Select

**Name:** CPUSEL  
**Offset:** 0x08  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
	CPUDIV[2:0]							
Access						R/W	R/W	R/W
Reset						0	0	0

#### Bits 2:0 – CPUDIV[2:0]: CPU Prescaler Selection

These bits define the division ratio of the main clock prescaler ( $2^n$ ).

CPUDIV[2:0]	Name	Description
0x0	DIV1	Divide by 1
0x1	DIV2	Divide by 2
0x2	DIV4	Divide by 4
0x3	DIV8	Divide by 8
0x4	DIV16	Divide by 16
0x5	DIV32	Divide by 32
0x6	DIV64	Divide by 64
0x7	DIV128	Divide by 128

#### 16.8.4. APBA Clock Select

**Name:** APBASEL  
**Offset:** 0x09  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
	APBADIV[2:0]							
Access						R/W	R/W	R/W
Reset						0	0	0

#### Bits 2:0 – APBADIV[2:0]: APBA Prescaler Selection

These bits define the division ratio of the APBA clock prescaler ( $2^n$ ).

APBADIV[2:0]	Name	Description
0x0	DIV1	Divide by 1
0x1	DIV2	Divide by 2
0x2	DIV4	Divide by 4
0x3	DIV8	Divide by 8
0x4	DIV16	Divide by 16
0x5	DIV32	Divide by 32
0x6	DIV64	Divide by 64
0x7	DIV128	Divide by 128

### 16.8.5. APBB Clock Select

**Name:** APBBSEL  
**Offset:** 0x0A  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
	APBBDIV[2:0]							
Access						R/W	R/W	R/W
Reset						0	0	0

#### Bits 2:0 – APBBDIV[2:0]: APBB Prescaler Selection

These bits define the division ratio of the APBB clock prescaler ( $2^n$ ).

APBBDIV[2:0]	Name	Description
0x0	DIV1	Divide by 1
0x1	DIV2	Divide by 2
0x2	DIV4	Divide by 4
0x3	DIV8	Divide by 8
0x4	DIV16	Divide by 16
0x5	DIV32	Divide by 32
0x6	DIV64	Divide by 64
0x7	DIV128	Divide by 128

### 16.8.6. APBC Clock Select

**Name:** APBCSEL  
**Offset:** 0x0B  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
	APBCDIV[2:0]							
Access						R/W	R/W	R/W
Reset						0	0	0

#### Bits 2:0 – APBCDIV[2:0]: APBC Prescaler Selection

These bits define the division ratio of the APBC clock prescaler ( $2^n$ ).

APBCDIV[2:0]	Name	Description
0x0	DIV1	Divide by 1
0x1	DIV2	Divide by 2
0x2	DIV4	Divide by 4
0x3	DIV8	Divide by 8
0x4	DIV16	Divide by 16
0x5	DIV32	Divide by 32
0x6	DIV64	Divide by 64
0x7	DIV128	Divide by 128

### 16.8.7. AHB Mask

**Name:** AHBMASK  
**Offset:** 0x14  
**Reset:** 0x0000007F  
**Property:** Write-Protected

Bit	31	30	29	28	27	26	25	24	
Access

#### Bit 4 – NVMCTRL: NVMCTRL AHB Clock Mask

Value	Description
0	The AHB clock for the NVMCTRL is stopped.
1	The AHB clock for the NVMCTRL is enabled.

#### Bit 3 – DSU: DSU AHB Clock Mask

Value	Description
0	The AHB clock for the DSU is stopped.
1	The AHB clock for the DSU is enabled.

#### Bit 2 – HPB2: HPB2 AHB Clock Mask

Value	Description
0	The AHB clock for the HPB2 is stopped.
1	The AHB clock for the HPB2 is enabled.

#### Bit 1 – HPB1: HPB1 AHB Clock Mask

Value	Description
0	The AHB clock for the HPB1 is stopped.
1	The AHB clock for the HPB1 is enabled.

#### Bit 0 – HPB0: HPB0 AHB Clock Mask

Value	Description
0	The AHB clock for the HPB0 is stopped.
1	The AHB clock for the HPB0 is enabled.

### 16.8.8. APBA Mask

**Name:** APBAMASK  
**Offset:** 0x18  
**Reset:** 0x0000007F  
**Property:** Write-Protected

#### Bit 6 – EIC: EIC APB Clock Enable

Value	Description
0	The APBA clock for the EIC is stopped.
1	The APBA clock for the EIC is enabled.

#### Bit 5 – RTC: RTC APB Clock Enable

Value	Description
0	The APBA clock for the RTC is stopped.
1	The APBA clock for the RTC is enabled.

#### Bit 4 – WDT: WDT APB Clock Enable

Value	Description
0	The APBA clock for the WDT is stopped.
1	The APBA clock for the WDT is enabled.

#### Bit 3 – GCLK: GCLK APB Clock Enable

Value	Description
0	The APBA clock for the GCLK is stopped.
1	The APBA clock for the GCLK is enabled.

#### Bit 2 – SYSCTRL: SYSCTRL APB Clock Enable

Value	Description
0	The APBA clock for the SYSCTRL is stopped.
1	The APBA clock for the SYSCTRL is enabled.

#### Bit 1 – PM: PM APB Clock Enable

Value	Description
0	The APBA clock for the PM is stopped.
1	The APBA clock for the PM is enabled.

#### Bit 0 – PAC0: PAC0 APB Clock Enable

Value	Description
0	The APBA clock for the PAC0 is stopped.
1	The APBA clock for the PAC0 is enabled.

### 16.8.9. APBB Mask

**Name:** APBBMASK  
**Offset:** 0x1C  
**Reset:** 0x0000007F

#### Bit 19 – PTC: PTC APB Clock Enable

Value	Description
0	The APBC clock for the PTC is stopped.
1	The APBC clock for the PTC is enabled.

#### Bit 18 – DAC: DAC APB Clock Enable

Value	Description
0	The APBC clock for the DAC is stopped.
1	The APBC clock for the DAC is enabled.

#### Bit 17 – AC: AC APB Clock Enable

Value	Description
0	The APBC clock for the AC is stopped.
1	The APBC clock for the AC is enabled.

#### Bit 16 – ADC: ADC APB Clock Enable

Value	Description
0	The APBC clock for the ADC is stopped.
1	The APBC clock for the ADC is enabled.

#### Bit 15 – TC7: TC7 APB Clock Enable

Value	Description
0	The APBC clock for the TC7 is stopped.
1	The APBC clock for the TC7 is enabled.

#### Bit 14 – TC6: TC6 APB Clock Enable

Value	Description
0	The APBC clock for the TC6 is stopped.
1	The APBC clock for the TC6 is enabled.

#### Bit 13 – TC5: TC5 APB Clock Enable

Value	Description
0	The APBC clock for the TC5 is stopped.
1	The APBC clock for the TC5 is enabled.

#### Bit 12 – TC4: TC4 APB Clock Enable

Value	Description
0	The APBC clock for the TC4 is stopped.
1	The APBC clock for the TC4 is enabled.

#### Bit 11 – TC3: TC3 APB Clock Enable

Value	Description
0	The APBC clock for the TC3 is stopped.
1	The APBC clock for the TC3 is enabled.

#### Bit 10 – TC2: TC2 APB Clock Enable

Value	Description
0	The APBC clock for the TC2 is stopped.
1	The APBC clock for the TC2 is enabled.

#### Bit 9 – TC1: TC1 APB Clock Enable

Value	Description
0	The APBC clock for the TC1 is stopped.
1	The APBC clock for the TC1 is enabled.

#### **Bit 8 – TC0: TC0 APB Clock Enable**

<b>Value</b>	<b>Description</b>
0	The APBC clock for the TC0 is stopped.
1	The APBC clock for the TC0 is enabled.

#### **Bit 7 – SERCOM5: SERCOM5 APB Clock Enable**

<b>Value</b>	<b>Description</b>
0	The APBC clock for the SERCOM5 is stopped.
1	The APBC clock for the SERCOM5 is enabled.

#### **Bit 6 – SERCOM4: SERCOM4 APB Clock Enable**

<b>Value</b>	<b>Description</b>
0	The APBC clock for the SERCOM4 is stopped.
1	The APBC clock for the SERCOM4 is enabled.

#### **Bit 5 – SERCOM3: SERCOM2 APB Clock Enable**

<b>Value</b>	<b>Description</b>
0	The APBC clock for the SERCOM3 is stopped.
1	The APBC clock for the SERCOM3 is enabled.

#### **Bit 4 – SERCOM2: SERCOM2 APB Clock Enable**

<b>Value</b>	<b>Description</b>
0	The APBC clock for the SERCOM2 is stopped.
1	The APBC clock for the SERCOM2 is enabled.

#### **Bit 3 – SERCOM1: SERCOM1 APB Clock Enable**

<b>Value</b>	<b>Description</b>
0	The APBC clock for the SERCOM1 is stopped.
1	The APBC clock for the SERCOM1 is enabled.

#### **Bit 2 – SERCOM0: SERCOM0 APB Clock Enable**

<b>Value</b>	<b>Description</b>
0	The APBC clock for the SERCOM0 is stopped.
1	The APBC clock for the SERCOM0 is enabled.

#### **Bit 1 – EVSYS: EVSYS APB Clock Enable**

Value	Description
0	The APBC clock for the EVSYS is stopped.
1	The APBC clock for the EVSYS is enabled.

#### Bit 0 – PAC2: PAC2 APB Clock Enable

Value	Description
0	The APBC clock for the PAC2 is stopped.
1	The APBC clock for the PAC2 is enabled.

### 16.8.11. Interrupt Enable Clear

**Name:** INTENCLR  
**Offset:** 0x34  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
Access							CFD	CKRDY
Reset							0	0

#### Bit 1 – CFD: Clock Failure Detector Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Clock Failure Detector Interrupt Enable bit and the corresponding interrupt request.

Value	Description
0	The Clock Failure Detector interrupt is disabled.
1	The Clock Failure Detector interrupt is enabled and will generate an interrupt request when the Clock Failure Detector Interrupt flag is set.

#### Bit 0 – CKRDY: Clock Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Clock Ready Interrupt Enable bit and the corresponding interrupt request.

Value	Description
0	The Clock Ready interrupt is disabled.
1	The Clock Ready interrupt is enabled and will generate an interrupt request when the Clock Ready Interrupt flag is set.

### 16.8.12. Interrupt Enable Set

**Name:** INTENSET  
**Offset:** 0x35  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
Access							CFD	CKRDY
Reset							0	0
							R/W	R/W

#### Bit 1 – CFD: Clock Failure Detector Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Clock Failure Detector Interrupt Enable bit and the corresponding interrupt request.

Value	Description
0	The Clock Failure Detector interrupt is disabled.
1	The Clock Failure Detector interrupt is enabled and will generate an interrupt request when the Clock Failure Detector Interrupt flag is set.

#### Bit 0 – CKRDY: Clock Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the Clock Ready Interrupt Enable bit and enable the Clock Ready interrupt.

Value	Description
0	The Clock Ready interrupt is disabled.
1	The Clock Ready interrupt is enabled.

### 16.8.13. Interrupt Flag Status and Clear

Name: INTFLAG

Offset: 0x36

Reset: 0x00

Property: -

Bit	7	6	5	4	3	2	1	0
Access							CFD	CKRDY
Reset							0	0
							R/W	R/W

#### Bit 1 – CFD: Clock Failure Detector Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Clock Failure Detector Interrupt Enable bit and the corresponding interrupt request.

Value	Description
0	The Clock Failure Detector interrupt is disabled.
1	The Clock Failure Detector interrupt is enabled and will generate an interrupt request when the Clock Failure Detector Interrupt flag is set.

#### Bit 0 – CKRDY: Clock Ready

This flag is cleared by writing a one to the flag.

This flag is set when the synchronous CPU and APBx clocks have frequencies as indicated in the CPUSEL and APBxSEL registers, and will generate an interrupt if INTENCLR/SET.CKRDY is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Clock Ready Interrupt flag.

#### 16.8.14. Reset Cause

**Name:** RCAUSE

**Offset:** 0x38

**Reset:** 0x01

**Property:** -

Bit	7	6	5	4	3	2	1	0
Access		SYST	WDT	EXT		BOD33	BOD12	POR
Reset		R	R	R		R	R	R
	0	0	0		0	0	0	1

##### **Bit 6 – SYST: System Reset Request**

This bit is set if a system reset request has been performed. Refer to the Cortex processor documentation for more details.

##### **Bit 5 – WDT: Watchdog Reset**

This flag is set if a Watchdog Timer reset occurs.

##### **Bit 4 – EXT: External Reset**

This flag is set if an external reset occurs.

##### **Bit 2 – BOD33: Brown Out 33 Detector Reset**

This flag is set if a BOD33 reset occurs.

##### **Bit 1 – BOD12: Brown Out 12 Detector Reset**

This flag is set if a BOD12 reset occurs.

##### **Bit 0 – POR: Power On Reset**

This flag is set if a POR occurs.

## 17. SYSCTRL – System Controller

### 17.1. Overview

The System Controller (SYSCTRL) provides a user interface to the clock sources, brown out detectors, on-chip voltage regulator and voltage reference of the device.

Through the interface registers, it is possible to enable, disable, calibrate and monitor the SYSCTRL sub-peripherals.

All sub-peripheral statuses are collected in the Power and Clocks Status register (PCLKSR). They can additionally trigger interrupts upon status changes via the INTENSET (INTENSET), INTENCLR (INTENCLR) and INTFLAG (INTFLAG) registers.

Additionally, BOD33 interrupts can be used to wake up the device from standby mode upon a programmed brown-out detection.

[INTENSET](#) on page 184

[INTFLAG](#) on page 188

[BOD33](#) on page 211

[INTENCLR](#) on page 180

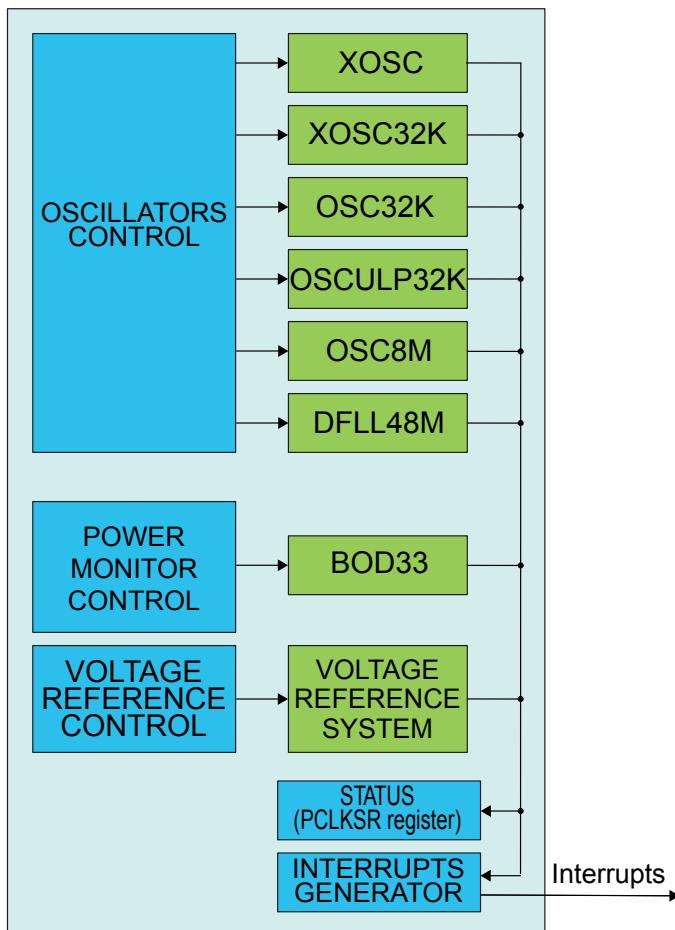

### 17.2. Features

- 0.4-32MHz Crystal Oscillator (XOSC)
  - Tunable gain control
  - Programmable start-up time
  - Crystal or external input clock on XIN I/O
- 32.768kHz Crystal Oscillator (XOSC32K)
  - Automatic or manual gain control
  - Programmable start-up time
  - Crystal or external input clock on XIN32 I/O
- 32.768kHz High Accuracy Internal Oscillator (OSC32K)
  - Frequency fine tuning
  - Programmable start-up time
- 32.768kHz Ultra Low Power Internal Oscillator (OSCULP32K)
  - Ultra low power, always-on oscillator
  - Frequency fine tuning
  - Calibration value loaded from Flash Factory Calibration at reset
- 8MHz Internal Oscillator (OSC8M)
  - Fast startup
  - Output frequency fine tuning
  - 4/2/1MHz divided output frequencies available
  - Calibration value loaded from Flash Factory Calibration at reset
- Digital Frequency Locked Loop (DFLL48M)

- Internal oscillator with no external components
  - 48MHz output frequency
  - Operates standalone as a high-frequency programmable oscillator in open loop mode
  - Operates as an accurate frequency multiplier against a known frequency in closed loop mode
- 3.3V Brown-Out Detector (BOD33)
  - Programmable threshold
  - Threshold value loaded from Flash User Calibration at startup
  - Triggers resets or interrupts
  - Operating modes:
    - Continuous mode
    - Sampled mode for low power applications (programmable refresh frequency)
  - Hysteresis
- Internal Voltage Regulator system (VREG)
  - Operating modes:
    - Normal mode
    - Low-power mode
  - With an internal non-configurable Brown-out detector (BOD12)
- Voltage Reference System (VREF)
  - Bandgap voltage generator with programmable calibration value
  - Temperature sensor
  - Bandgap calibration value loaded from Flash Factory Calibration at start-up

### 17.3. Block Diagram

Figure 17-1. SYSCTRL Block Diagram

### 17.4. Signal Description

Signal Name	Types	Description
XIN	Analog Input	Multipurpose Crystal Oscillator or external clock generator input
XOUT	Analog Output	External Multipurpose Crystal Oscillator output
XIN32	Analog Input	32kHz Crystal Oscillator or external clock generator input
XOUT32	Analog Output	32kHz Crystal Oscillator output

The I/O lines are automatically selected when XOSC or XOSC32K are enabled. Refer to *Oscillator Pinout*.

#### Related Links

[I/O Multiplexing and Considerations](#) on page 27

[Oscillator Pinout](#) on page 29

## 17.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly, as described below.

### 17.5.1. I/O Lines

I/O lines are configured by SYSCTRL when either XOSC or XOSC32K are enabled, and need no user configuration.

### 17.5.2. Power Management

The BOD33 and BOD12 can trigger resets when the I/O supply or core supply voltages drop below the programmed threshold value. BOD33 and BOD12 can additionally wake up the system from standby mode when I/O or core supply failure is detected. However, BOD33 and BOD12 cannot be used in continuous mode when the system is in standby mode, and will, therefore, be automatically disabled until the system is woken up. Only sampled mode operation is allowed when the system is in standby mode.

All oscillators except XOSC32K, OSC32K and OSCULP32K are turned off in some sleep modes and turned automatically on when the chip wakes up.

The SYSCTRL can continue to operate in any sleep mode where the selected source clock is running. The SYSCTRL interrupts can be used to wake up the device from sleep modes. The events can trigger other operations in the system without exiting sleep modes. Refer to *PM – Power Manager* on the different sleep modes.

#### Related Links

[PM – Power Manager](#) on page 129

### 17.5.3. Clocks

The SYSCTRL gathers controls for all device oscillators and provides clock sources to the Generic Clock Controller (GCLK). The available clock sources are: XOSC, XOSC32K, OSC32K, OSCULP32K, OSC8M and DFLL48M.

The SYSCTRL bus clock (CLK\_SYSCTRL\_APB) can be enabled and disabled in the Power Manager, and the default state of CLK\_SYSCTRL\_APB can be found in the Peripheral Clock Masking section in the PM – Power Manager.

The clock used by BOD33in sampled mode is asynchronous to the user interface clock (CLK\_SYSCTRL\_APB). Likewise, the DFLL48M control logic uses the DFLL oscillator output, which is also asynchronous to the user interface clock (CLK\_SYSCTRL\_APB). Due to this asynchronicity, writes to certain registers will require synchronization between the clock domains. Refer to [Synchronization](#) for further details.

### 17.5.4. Interrupts

The interrupt request line is connected to the Interrupt Controller. Using the SYSCTRL interrupts requires the Interrupt Controller to be configured first. Refer to *Nested Vector Interrupt Controller* for details.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 17.5.5. Debug Operation

When the CPU is halted in debug mode, the SYSCTRL continues normal operation. If the SYSCTRL is configured in a way that requires it to be periodically serviced by the CPU through interrupts or similar, improper operation or data loss may result during debugging.

If debugger cold-plugging is detected by the system, BOD33 reset will be masked. The BOD resets keep running under hot-plugging. This allows to correct a BOD33 user level too high for the available supply.

### 17.5.6. Register Access Protection

Registers with write-access can be optionally write-protected by the Peripheral Access Controller (PAC), except the following:

- Interrupt Flag Status and Clear register (INTFLAG)

**Note:** Optional write-protection is indicated by the "PAC Write-Protection" property in the register description.

When the CPU is halted in debug mode, all write-protection is automatically disabled. Write-protection does not apply for accesses through an external debugger.

#### Related Links

[PAC - Peripheral Access Controller](#) on page 45

[INTFLAG](#) on page 188

### 17.5.7. Analog Connections

When used, the 32.768kHz crystal must be connected between the XIN32 and XOUT32 pins, and the 0.4-32MHz crystal must be connected between the XIN and XOUT pins, along with any required load capacitors. For details on recommended oscillator characteristics and capacitor load, refer to the *Electrical Characteristics* for details.

#### Related Links

[Electrical Characteristics](#) on page 606

## 17.6. Functional Description

### 17.6.1. Principle of Operation

XOSC, XOSC32K, OSC32K, OSCULP32K, OSC8M, DFLL48M, BOD33, and VREF are configured via SYSCTRL control registers. Through this interface, the sub-peripherals are enabled, disabled or have their calibration values updated.

The Power and Clocks Status register gathers different status signals coming from the sub-peripherals controlled by the SYSCTRL. The status signals can be used to generate system interrupts, and in some cases wake up the system from standby mode, provided the corresponding interrupt is enabled.

The oscillator must be enabled to run. The oscillator is enabled by writing a one to the ENABLE bit in the respective oscillator control register, and disabled by writing a zero to the oscillator control register. In idle mode, the default operation of the oscillator is to run only when requested by a peripheral. In standby mode, the default operation of the oscillator is to stop. This behavior can be changed by the user, see below for details.

The behavior of the oscillators in the different sleep modes is shown in the table below.

Table 17-1. Behavior of the Oscillators

Oscillator	Idle 0, 1, 2	Standby
XOSC	Run on request	Stop
XOSC32K	Run on request	Stop
OSC32K	Run on request	Stop
OSCULP32K	Run	Run

Oscillator	Idle 0, 1, 2	Standby
OSC8M	Run on request	Stop
DFLL48M	Run on request	Stop

To force an oscillator to always run in idle mode, and not only when requested by a peripheral, the oscillator ONDEMAND bit must be written to zero. The default value of this bit is one, and thus the default operation in idle mode is to run only when requested by a peripheral.

To force the oscillator to run in standby mode, the RUNSTDBY bit must be written to one. The oscillator will then run in standby mode when requested by a peripheral (ONDEMAND is one). To force an oscillator to always run in standby mode, and not only when requested by a peripheral, the ONDEMAND bit must be written to zero and RUNSTDBY must be written to one.

The next table shows the behavior in the different sleep modes, depending on the settings of ONDEMAND and RUNSTDBY.

**Table 17-2. Behavior in the different sleep modes**

Sleep mode	ONDEMAND	RUNSTDBY	Behavior
Idle 0, 1, 2	0	X	Run
Idle 0, 1, 2	1	X	Run when requested by a peripheral
Standby	0	0	Stop
Standby	0	1	Run
Standby	1	0	Stop
Standby	1	1	Run when requested by a peripheral

**Note:** This does not apply to the OSCULP32K oscillator, which is always running and cannot be disabled.

### 17.6.2. External Multipurpose Crystal Oscillator (XOSC) Operation

The XOSC can operate in two different modes:

- External clock, with an external clock signal connected to the XIN pin
- Crystal oscillator, with an external 0.4-32MHz crystal

The XOSC can be used as a clock source for generic clock generators, as described in the *GCLK – Generic Clock Controller*.

At reset, the XOSC is disabled, and the XIN/XOUT pins can be used as General Purpose I/O (GPIO) pins or by other peripherals in the system. When XOSC is enabled, the operating mode determines the GPIO usage. When in crystal oscillator mode, the XIN and XOUT pins are controlled by the SYSCTRL, and GPIO functions are overridden on both pins. When in external clock mode, only the XIN pin will be overridden and controlled by the SYSCTRL, while the XOUT pin can still be used as a GPIO pin.

The XOSC is enabled by writing a one to the Enable bit in the External Multipurpose Crystal Oscillator Control register (XOSC.ENABLE). To enable the XOSC as a crystal oscillator, a one must be written to the XTAL Enable bit (XOSC.XTALEN). If XOSC.XTALEN is zero, external clock input will be enabled.

When in crystal oscillator mode (XOSC.XTALEN is one), the External Multipurpose Crystal Oscillator Gain (XOSC.GAIN) must be set to match the external crystal oscillator frequency. If the External

Multipurpose Crystal Oscillator Automatic Amplitude Gain Control (XOSC.AMPGC) is one, the oscillator amplitude will be automatically adjusted, and in most cases result in a lower power consumption.

The XOSC will behave differently in different sleep modes based on the settings of XOSC.RUNSTDBY, XOSC.ONDEMAND and XOSC.ENABLE:

XOSC.RUNSTDBY	XOSC.ONDEMAND	XOSC.ENABLE	Sleep Behavior
-	-	0	Disabled
0	0	1	Always run in IDLE sleep modes. Disabled in STANDBY sleep mode.
0	1	1	Only run in IDLE sleep modes if requested by a peripheral. Disabled in STANDBY sleep mode.
1	0	1	Always run in IDLE and STANDBY sleep modes.
1	1	1	Only run in IDLE or STANDBY sleep modes if requested by a peripheral.

After a hard reset, or when waking up from a sleep mode where the XOSC was disabled, the XOSC will need a certain amount of time to stabilize on the correct frequency. This start-up time can be configured by changing the Oscillator Start-Up Time bit group (XOSC.STARTUP) in the External Multipurpose Crystal Oscillator Control register. During the start-up time, the oscillator output is masked to ensure that no unstable clock propagates to the digital logic. The External Multipurpose Crystal Oscillator Ready bit in the Power and Clock Status register (PCLKSR.XOSCRDY) is set when the user-selected start-up time is over. An interrupt is generated on a zero-to-one transition on PCLKSR.XOSCRDY if the External Multipurpose Crystal Oscillator Ready bit in the Interrupt Enable Set register (INTENSET.XOSCRDY) is set.

**Note:** Do not enter standby mode when an oscillator is in start-up:

Wait for the OSCxRDY bit in SYSCTRL.PCLKSR register to be set before going into standby mode.

#### Related Links

[GCLK - Generic Clock Controller](#) on page 108

#### 17.6.3. 32kHz External Crystal Oscillator (XOSC32K) Operation

The XOSC32K can operate in two different modes:

- External clock, with an external clock signal connected to XIN32
- Crystal oscillator, with an external 32.768kHz crystal connected between XIN32 and XOUT32

The XOSC32K can be used as a source for generic clock generators, as described in the [GCLK – Generic Clock Controller](#).

At power-on reset (POR) the XOSC32K is disabled, and the XIN32/XOUT32 pins can be used as General Purpose I/O (GPIO) pins or by other peripherals in the system. When XOSC32K is enabled, the operating mode determines the GPIO usage. When in crystal oscillator mode, XIN32 and XOUT32 are controlled by the SYSCTRL, and GPIO functions are overridden on both pins. When in external clock mode, only the XIN32 pin will be overridden and controlled by the SYSCTRL, while the XOUT32 pin can still be used as a GPIO pin.

The external clock or crystal oscillator is enabled by writing a one to the Enable bit (XOSC32K.ENABLE) in the 32kHz External Crystal Oscillator Control register. To enable the XOSC32K as a crystal oscillator, a

one must be written to the XTAL Enable bit (XOSC32K.XTALEN). If XOSC32K.XTALEN is zero, external clock input will be enabled.

The oscillator is disabled by writing a zero to the Enable bit (XOSC32K.ENABLE) in the 32kHz External Crystal Oscillator Control register while keeping the other bits unchanged. Writing to the XOSC32K.ENABLE bit while writing to other bits may result in unpredictable behavior. The oscillator remains enabled in all sleep modes if it has been enabled beforehand. The start-up time of the 32kHz External Crystal Oscillator is selected by writing to the Oscillator Start-Up Time bit group (XOSC32K.STARTUP) in the 32kHz External Crystal Oscillator Control register. The SYSTCTRL masks the oscillator output during the start-up time to ensure that no unstable clock propagates to the digital logic. The 32kHz External Crystal Oscillator Ready bit (PCLKSR.XOSC32KRDY) in the Power and Clock Status register is set when the user-selected startup time is over. An interrupt is generated on a zero-to-one transition of PCLKSR.XOSC32KRDY if the 32kHz External Crystal Oscillator Ready bit (INTENSET.XOSC32KRDY) in the Interrupt Enable Set Register is set.

As a crystal oscillator usually requires a very long start-up time (up to one second), the 32kHz External Crystal Oscillator will keep running across resets, except for power-on reset (POR).

XOSC32K can provide two clock outputs when connected to a crystal. The XOSC32K has a 32.768kHz output enabled by writing a one to the 32kHz External Crystal Oscillator 32kHz Output Enable bit (XOSC32K.EN32K) in the 32kHz External Crystal Oscillator Control register. XOSC32K.EN32K is only usable when XIN32 is connected to a crystal, and not when an external digital clock is applied on XIN32.

**Note:** Do not enter standby mode when an oscillator is in start-up:

Wait for the OSCxRDY bit in SYSTCTRL.PCLKSR register to be set before going into standby mode.

#### Related Links

[GCLK - Generic Clock Controller](#) on page 108

#### 17.6.4. 32kHz Internal Oscillator (OSC32K) Operation

The OSC32K provides a tunable, low-speed and low-power clock source.

The OSC32K can be used as a source for the generic clock generators, as described in the [GCLK – Generic Clock Controller](#).

The OSC32K is disabled by default. The OSC32K is enabled by writing a one to the 32kHz Internal Oscillator Enable bit (OSC32K.ENABLE) in the 32kHz Internal Oscillator Control register. It is disabled by writing a zero to OSC32K.ENABLE. The OSC32K has a 32.768kHz output enabled by writing a one to the 32kHz Internal Oscillator 32kHz Output Enable bit (OSC32K.EN32K).

The frequency of the OSC32K oscillator is controlled by the value in the 32kHz Internal Oscillator Calibration bits (OSC32K.CALIB) in the 32kHz Internal Oscillator Control register. The OSC32K.CALIB value must be written by the user. Flash Factory Calibration values are stored in the NVM Software Calibration Area (refer to [NVM Software Calibration Area Mapping](#)). When writing to the Calibration bits, the user must wait for the PCLKSR.OSC32KRDY bit to go high before the value is committed to the oscillator.

#### Related Links

[GCLK - Generic Clock Controller](#) on page 108

[NVM Software Calibration Area Mapping](#) on page 38

#### 17.6.5. 32kHz Ultra Low Power Internal Oscillator (OSCULP32K) Operation

The OSCULP32K provides a tunable, low-speed and ultra-low-power clock source. The OSCULP32K is factory-calibrated under typical voltage and temperature conditions. The OSCULP32K should be

preferred to the OSC32K whenever the power requirements are prevalent over frequency stability and accuracy.

The OSCULP32K can be used as a source for the generic clock generators, as described in the *GCLK – Generic Clock Controller*.

The OSCULP32K is enabled by default after a power-on reset (POR) and will always run except during POR. The OSCULP32K has a 32.768kHz output and a 1.024kHz output that are always running.

The frequency of the OSCULP32K oscillator is controlled by the value in the 32kHz Ultra Low Power Internal Oscillator Calibration bits (OSCULP32K.CALIB) in the 32kHz Ultra Low Power Internal Oscillator Control register. OSCULP32K.CALIB is automatically loaded from Flash Factory Calibration during startup, and is used to compensate for process variation, as described in the *Electrical Characteristics*. The calibration value can be overridden by the user by writing to OSCULP32K.CALIB.

#### Related Links

[Electrical Characteristics](#) on page 606

[GCLK - Generic Clock Controller](#) on page 108

#### 17.6.6. 8MHz Internal Oscillator (OSC8M) Operation

OSC8M is an internal oscillator operating in open-loop mode and generating an 8MHz frequency. The OSC8M is factory-calibrated under typical voltage and temperature conditions.

OSC8M is the default clock source that is used after a power-on reset (POR). The OSC8M can be used as a source for the generic clock generators, as described in the *GCLK – Generic Clock Controller*.

In order to enable OSC8M, the Oscillator Enable bit in the OSC8M Control register (OSC8M.ENABLE) must be written to one. OSC8M will not be enabled until OSC8M.ENABLE is set. In order to disable OSC8M, OSC8M.ENABLE must be written to zero. OSC8M will not be disabled until OSC8M is cleared.

The frequency of the OSC8M oscillator is controlled by the value in the calibration bits (OSC8M.CALIB) in the OSC8M Control register. CALIB is automatically loaded from Flash Factory Calibration during startup, and is used to compensate for process variation, as described in the *Electrical Characteristics*.

The user can control the oscillation frequency by writing to the Frequency Range (FRANGE) and Calibration (CALIB) bit groups in the 8MHz RC Oscillator Control register (OSC8M). It is not recommended to update the FRANGE and CALIB bits when the OSC8M is enabled. As this is in open-loop mode, the frequency will be voltage, temperature and process dependent. Refer to the *Electrical Characteristics* for details.

OSC8M is automatically switched off in certain sleep modes to reduce power consumption, as described in the *PM – Power Manager*.

#### Related Links

[PM – Power Manager](#) on page 129

[Electrical Characteristics](#) on page 606

[GCLK - Generic Clock Controller](#) on page 108

#### 17.6.7. Digital Frequency Locked Loop (DFLL48M) Operation

The DFLL48M can operate in both open-loop mode and closed-loop mode. In closed-loop mode, a low-frequency clock with high accuracy can be used as the reference clock to get high accuracy on the output clock (CLK\_DFLL48M).

The DFLL48M can be used as a source for the generic clock generators, as described in the *GCLK – Generic Clock Controller*.

#### Related Links

#### 17.6.7.1. Basic Operation

##### Open-Loop Operation

After any reset, the open-loop mode is selected. When operating in open-loop mode, the output frequency of the DFLL48M will be determined by the values written to the DFLL Coarse Value bit group and the DFLL Fine Value bit group (DFLLVAL.COARSE and DFLLVAL.FINE) in the DFLL Value register. Using "DFLL48M COARSE CAL" value from *NVM Software Calibration Area Mapping* in DFLL.COARSE helps to output a frequency close to 48 MHz.

It is possible to change the values of DFLLVAL.COARSE and DFLLVAL.FINE and thereby the output frequency of the DFLL48M output clock, CLK\_DFLL48M, while the DFLL48M is enabled and in use. CLK\_DFLL48M is ready to be used when PCLKSR.DFLLRDY is set after enabling the DFLL48M.

##### Related Links

[NVM Software Calibration Area Mapping](#) on page 38

##### Closed-Loop Operation

In closed-loop operation, the output frequency is continuously regulated against a reference clock. Once the multiplication factor is set, the oscillator fine tuning is automatically adjusted. The DFLL48M must be correctly configured before closed-loop operation can be enabled. After enabling the DFLL48M, it must be configured in the following way:

1. Enable and select a reference clock (CLK\_DFLL48M\_REF). CLK\_DFLL48M\_REF is Generic Clock Channel 0 (GCLK\_DFLL48M\_REF). Refer to *GCLK – Generic Clock Controller* for details.
2. Select the maximum step size allowed in finding the Coarse and Fine values by writing the appropriate values to the DFLL Coarse Maximum Step and DFLL Fine Maximum Step bit groups (DFLLMUL.CSTEP and DFLLMUL.FSTEP) in the DFLL Multiplier register. A small step size will ensure low overshoot on the output frequency, but will typically result in longer lock times. A high value might give a large overshoot, but will typically provide faster locking. DFLLMUL.CSTEP and DFLLMUL.FSTEP should not be higher than 50% of the maximum value of DFLLVAL.COARSE and DFLLVAL.FINE, respectively.
3. Select the multiplication factor in the DFLL Multiply Factor bit group (DFLLMUL.MUL) in the DFLL Multiplier register. Care must be taken when choosing DFLLMUL.MUL so that the output frequency does not exceed the maximum frequency of the DFLL. If the target frequency is below the minimum frequency of the DFLL48M, the output frequency will be equal to the DFLL minimum frequency.
4. Start the closed loop mode by writing a one to the DFLL Mode Selection bit (DFLLCTRL.MODE) in the DFLL Control register.

The frequency of CLK\_DFLL48M ( $F_{\text{clkdfll48m}}$ ) is given by:

$$F_{\text{clkdfll48m}} = \text{DFLLMUL} \cdot \text{MUL} \times F_{\text{clkdfll48mref}}$$

where  $F_{\text{clkdfll48mref}}$  is the frequency of the reference clock (CLK\_DFLL48M\_REF). DFLLVAL.COARSE and DFLLVAL.FINE are read-only in closed-loop mode, and are controlled by the frequency tuner to meet user specified frequency. In closed-loop mode, the value in DFLLVAL.COARSE is used by the frequency tuner as a starting point for Coarse. Writing DFLLVAL.COARSE to a value close to the final value before entering closed-loop mode will reduce the time needed to get a lock on Coarse.

Using "DFLL48M COARSE CAL" from *NVM Software Calibration Area Mapping* for DFLL.COARSE will start DFLL with a frequency close to 48 MHz.

Following Software sequence should be followed while using the same.

1. load "DFLL48M COARSE CAL" from *NVM User Row Mapping* in DFLL.COARSE register

2. Set DFLLCTRL.BPLCKC bit
3. Start DFLL close loop

This procedure will reduce DFLL Lock time to DFLL Fine lock time.

#### Related Links

[GCLK - Generic Clock Controller](#) on page 108

[NVM Software Calibration Area Mapping](#) on page 38

#### Frequency Locking

The locking of the frequency in closed-loop mode is divided into two stages. In the first, coarse stage, the control logic quickly finds the correct value for DFLLVAL.COARSE and sets the output frequency to a value close to the correct frequency. On coarse lock, the DFLL Locked on Coarse Value bit (PCLKSR.DFLLLOCKC) in the Power and Clocks Status register will be set.

In the second, fine stage, the control logic tunes the value in DFLLVAL.FINE so that the output frequency is very close to the desired frequency. On fine lock, the DFLL Locked on Fine Value bit (PCLKSR.DFLLLOCKF) in the Power and Clocks Status register will be set.

Interrupts are generated by both PCLKSR.DFLLLOCKC and PCLKSR.DFLLLOCKF if INTENSET.DFLLOCKC or INTENSET.DFLLOCKF are written to one.

CLK\_DFLL48M is ready to be used when the DFLL Ready bit (PCLKSR.DFLLRDY) in the Power and Clocks Status register is set, but the accuracy of the output frequency depends on which locks are set. For lock times, refer to the *Electrical Characteristics*.

#### Related Links

[Electrical Characteristics](#) on page 606

#### Frequency Error Measurement

The ratio between CLK\_DFLL48M\_REF and CLK48M\_DFLL is measured automatically when the DFLL48M is in closed-loop mode. The difference between this ratio and the value in DFLLMUL.MUL is stored in the DFLL Multiplication Ratio Difference bit group(DFLLVAL.DIFF) in the DFLL Value register. The relative error on CLK\_DFLL48M compared to the target frequency is calculated as follows:

$$\text{ERROR} = \frac{\text{DIFF}}{\text{MUL}}$$

#### Drift Compensation

If the Stable DFLL Frequency bit (DFLLCTRL.STABLE) in the DFLL Control register is zero, the frequency tuner will automatically compensate for drift in the CLK\_DFLL48M without losing either of the locks. This means that DFLLVAL.FINE can change after every measurement of CLK\_DFLL48M.

The DFLLVAL.FINE value overflows or underflows can occur in close loop mode when the clock source reference drifts or is unstable. This will set the DFLL Out Of Bounds bit (PCLKSR.DFLLOOB) in the Power and Clocks Status register.

To avoid this error, the reference clock in close loop mode must be stable, an external oscillator is recommended and internal oscillator forbidden. The better choice is to use an XOSC32K.

#### Reference Clock Stop Detection

If CLK\_DFLL48M\_REF stops or is running at a very low frequency (slower than CLK\_DFLL48M/(2 \* MUL<sub>MAX</sub>)), the DFLL Reference Clock Stopped bit (PCLKSR.DFLLRCS) in the Power and Clocks Status register will be set. Detecting a stopped reference clock can take a long time, on the order of 217 CLK\_DFLL48M cycles. When the reference clock is stopped, the DFLL48M will operate as if in open-loop mode. Closed-loop mode operation will automatically resume if the CLK\_DFLL48M\_REF is restarted. An

interrupt is generated on a zero-to-one transition on PCLKSR.DFLLRCS if the DFLL Reference Clock Stopped bit (INTENSET.DFLLRCS) in the Interrupt Enable Set register is set.

#### 17.6.7.2. Additional Features

##### Dealing with Delay in the DFLL in Closed-Loop Mode

The time from selecting a new CLK\_DFLL48M frequency until this frequency is output by the DFLL48M can be up to several microseconds. If the value in DFLLMUL.MUL is small, this can lead to instability in the DFLL48M locking mechanism, which can prevent the DFLL48M from achieving locks. To avoid this, a chill cycle, during which the CLK\_DFLL48M frequency is not measured, can be enabled. The chill cycle is enabled by default, but can be disabled by writing a one to the DFLL Chill Cycle Disable bit (DFLLCTRL.CCDIS) in the DFLL Control register. Enabling chill cycles might double the lock time.

Another solution to this problem consists of using less strict lock requirements. This is called Quick Lock (QL), which is also enabled by default, but it can be disabled by writing a one to the Quick Lock Disable bit (DFLLCTRL.QLDIS) in the DFLL Control register. The Quick Lock might lead to a larger spread in the output frequency than chill cycles, but the average output frequency is the same.

##### Wake from Sleep Modes

DFLL48M can optionally reset its lock bits when it is disabled. This is configured by the Lose Lock After Wake bit (DFLLCTRL.LLAW) in the DFLL Control register. If DFLLCTRL.LLAW is zero, the DFLL48M will be re-enabled and start running with the same configuration as before being disabled, even if the reference clock is not available. The locks will not be lost. When the reference clock has restarted, the Fine tracking will quickly compensate for any frequency drift during sleep if DFLLCTRL.STABLE is zero. If DFLLCTRL.LLAW is one when the DFLL is turned off, the DFLL48M will lose all its locks, and needs to regain these through the full lock sequence.

##### Accuracy

There are three main factors that determine the accuracy of  $F_{\text{clkdfll48m}}$ . These can be tuned to obtain maximum accuracy when fine lock is achieved.

- Fine resolution: The frequency step between two Fine values. This is relatively smaller for high output frequencies.
- Resolution of the measurement: If the resolution of the measured  $F_{\text{clkdfll48m}}$  is low, i.e., the ratio between the CLK\_DFLL48M frequency and the CLK\_DFLL48M\_REF frequency is small, then the DFLL48M might lock at a frequency that is lower than the targeted frequency. It is recommended to use a reference clock frequency of 32kHz or lower to avoid this issue for low target frequencies.
- The accuracy of the reference clock.

#### 17.6.8. 3.3V Brown-Out Detector Operation

The 3.3V BOD monitors the 3.3V VDDANA supply (BOD33). It supports continuous or sampling modes.

The threshold value action (reset the device or generate an interrupt), the Hysteresis configuration, as well as the enable/disable settings are loaded from Flash User Calibration at startup, and can be overridden by writing to the corresponding BOD33 register bit groups.

##### 17.6.8.1. 3.3V Brown-Out Detector (BOD33)

The 3.3V Brown-Out Detector (BOD33) monitors the VDDANA supply and compares the voltage with the brown-out threshold level set in the BOD33 Level bit group (BOD33.LEVEL) in the BOD33 register. The BOD33 can generate either an interrupt or a reset when VDDANA crosses below the brown-out threshold level. The BOD33 detection status can be read from the BOD33 Detection bit (PCLKSR.BOD33DET) in the Power and Clocks Status register.

At start-up or at power-on reset (POR), the BOD33 register values are loaded from the Flash User Row. Refer to *NVM User Row Mapping* for more details.

## Related Links

[NVM User Row Mapping](#) on page 37

### 17.6.8.2. Continuous Mode

When the BOD33 Mode bit (BOD33.MODE) in the BOD33 register is written to zero and the BOD33 is enabled, the BOD33 operates in continuous mode. In this mode, the BOD33 is continuously monitoring the VDDANA supply voltage.

Continuous mode is the default mode for BOD33.

### 17.6.8.3. Sampling Mode

The sampling mode is a low-power mode where the BOD33 is being repeatedly enabled on a sampling clock's ticks. The BOD33 will monitor the supply voltage for a short period of time and then go to a low-power disabled state until the next sampling clock tick.

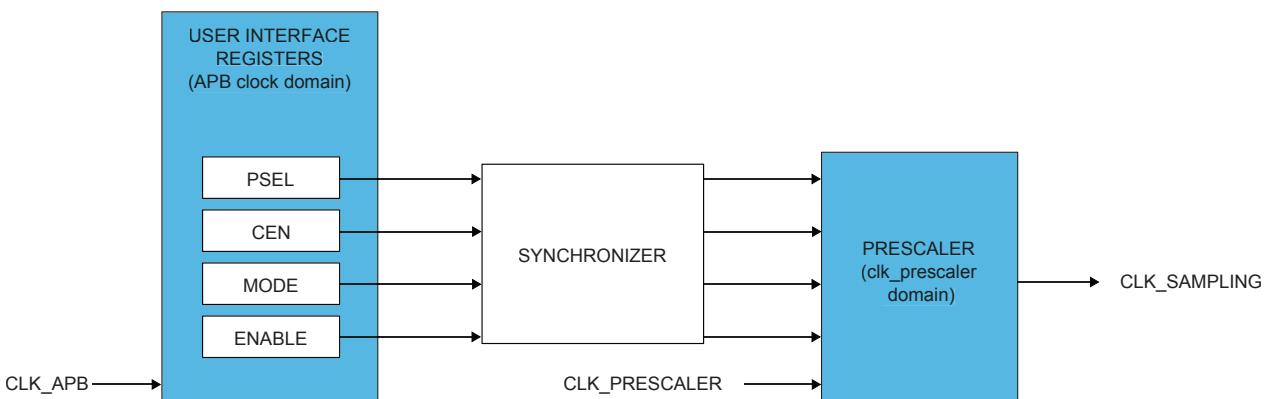

Sampling mode is enabled by writing one to BOD33.MODE. The frequency of the clock ticks ( $F_{\text{clk\_sampling}}$ ) is controlled by the BOD33 Prescaler Select bit group (BOD33.PSEL) in the BOD33 register.

$$F_{\text{clk\_sampling}} = \frac{F_{\text{clk\_prescaler}}}{2^{(\text{PSEL}+1)}}$$

The prescaler signal ( $F_{\text{clk\_prescaler}}$ ) is a 1kHz clock, output from the 32kHz Ultra Low Power Oscillator, OSCULP32K.

As the sampling mode clock is different from the APB clock domain, synchronization among the clocks is necessary. The next figure shows a block diagram of the sampling mode. The BOD33Synchronization Ready bits (PCLKSR.B33SRDY) in the Power and Clocks Status register show the synchronization ready status of the synchronizer. Writing attempts to the BOD33 register are ignored while PCLKSR.B33SRDY is zero.

**Figure 17-2. Sampling Mode Block diagram**

The BOD33 Clock Enable bit (BOD33.CEN) in the BOD33 register should always be disabled before changing the prescaler value. To change the prescaler value for the BOD33 during sampling mode, the following steps need to be taken:

1. Wait until the PCLKSR.B33SRDY bit is set.
2. Write the selected value to the BOD33.PSEL bit group.

### 17.6.8.4. Hysteresis

The hysteresis functionality can be used in both continuous and sampling mode. Writing a one to the BOD33 Hysteresis bit (BOD33.HYST) in the BOD33 register will add hysteresis to the BOD33 threshold level.

### 17.6.9. Voltage Reference System Operation

The Voltage Reference System (VREF) consists of a Bandgap Reference Voltage Generator and a temperature sensor.

The Bandgap Reference Voltage Generator is factory-calibrated under typical voltage and temperature conditions.

At reset, the VREF.CAL register value is loaded from Flash Factory Calibration.

The temperature sensor can be used to get an absolute temperature in the temperature range of CMIN to CMAX degrees Celsius. The sensor will output a linear voltage proportional to the temperature. The output voltage and temperature range are located in the *Electrical Characteristics*. To calculate the temperature from a measured voltage, the following formula can be used:

$$C_{\text{MIN}} + (V_{\text{mes}} - V_{\text{out}_{\text{MAX}}}) \frac{\Delta \text{temperature}}{\Delta \text{voltage}}$$

#### Related Links

[Electrical Characteristics](#) on page 606

#### 17.6.9.1. User Control of the Voltage Reference System

To enable the temperature sensor, write a one to the Temperature Sensor Enable bit (VREF.TSEN) in the VREF register.

The temperature sensor can be redirected to the ADC for conversion. The Bandgap Reference Voltage Generator output can also be routed to the ADC if the Bandgap Output Enable bit (VREF.BGOUTEN) in the VREF register is set.

The Bandgap Reference Voltage Generator output level is determined by the CALIB bit group (VREF.CALIB) value in the VREF register. The default calibration value can be overridden by the user by writing to the CALIB bit group.

### 17.6.10. Voltage Regulator System Operation

The embedded Voltage Regulator (VREG) is an internal voltage regulator that provides the core logic supply (VDDCORE).

### 17.6.11. Interrupts

The SYSCTRL has the following interrupt sources:

- XOSCRDY - Multipurpose Crystal Oscillator Ready: A “0-to-1” transition on the PCLKSR.XOSCRDY bit is detected
- XOSC32KRDY - 32kHz Crystal Oscillator Ready: A “0-to-1” transition on the PCLKSR.XOSC32KRDY bit is detected
- OSC32KRDY - 32kHz Internal Oscillator Ready: A “0-to-1” transition on the PCLKSR.OSC32KRDY bit is detected
- OSC8MRDY - 8MHz Internal Oscillator Ready: A “0-to-1” transition on the PCLKSR.OSC8MRDY bit is detected
- DFLLRDY - DFLL48M Ready: A “0-to-1” transition on the PCLKSR.DFLLRDY bit is detected
- DFLLOOB - DFLL48M Out Of Boundaries: A “0-to-1” transition on the PCLKSR.DFLLOOB bit is detected
- DFLLLOCKF - DFLL48M Fine Lock: A “0-to-1” transition on the PCLKSR.DFLLLOCKF bit is detected
- DFLLLOCKC - DFLL48M Coarse Lock: A “0-to-1” transition on the PCLKSR.DFLLLOCKC bit is detected

- DFLLRCS - DFLL48M Reference Clock has Stopped: A “0-to-1” transition on the PCLKSR.DFLLRCS bit is detected
- BOD33RDY - BOD33 Ready: A “0-to-1” transition on the PCLKSR.BOD33RDY bit is detected
- BOD33DET - BOD33 Detection: A “0-to-1” transition on the PCLKSR.BOD33DET bit is detected. This is an asynchronous interrupt and can be used to wake-up the device from any sleep mode.
- B33SRDY - BOD33 Synchronization Ready: A “0-to-1” transition on the PCLKSR.B33SRDY bit is detected

Each interrupt source has an interrupt flag associated with it. The interrupt flag in the Interrupt Flag Status and Clear (INTFLAG) register is set when the interrupt condition occurs. Each interrupt can be individually enabled by writing a one to the corresponding bit in the Interrupt Enable Set (INTENSET) register, and disabled by writing a one to the corresponding bit in the Interrupt Enable Clear (INTENCLR) register. An interrupt request is generated when the interrupt flag is set and the corresponding interrupt is enabled. The interrupt request remains active until the interrupt flag is cleared, the interrupt is disabled, or the SYSCTRL is reset. See Interrupt Flag Status and Clear (INTFLAG) register for details on how to clear interrupt flags.

All interrupt requests from the peripheral are ORed together on system level to generate one combined interrupt request to the NVIC. Refer to *Nested Vector Interrupt Controller* for details. The user must read the INTFLAG register to determine which interrupt condition is present.

**Note:** Interrupts must be globally enabled for interrupt requests to be generated. Refer to *Nested Vector Interrupt Controller* for details.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 17.6.12. Synchronization

Due to the multiple clock domains, values in the DFLL48M control registers need to be synchronized to other clock domains. The status of this synchronization can be read from the Power and Clocks Status register (PCLKSR). Before writing to any of the DFLL48M control registers, the user must check that the DFLL Ready bit (PCLKSR.DFLLRDY) in PCLKSR is set to one. When this bit is set, the DFLL48M can be configured and CLK\_DFLL48M is ready to be used. Any write to any of the DFLL48M control registers while DFLLRDY is zero will be ignored. An interrupt is generated on a zero-to-one transition of DFLLRDY if the DFLLRDY bit (INTENSET.DFLLRDY) in the Interrupt Enable Set register is set.

In order to read from any of the DFLL48M configuration registers, the user must request a read synchronization by writing a one to DFLLSYNC.READREQ. The registers can be read only when PCLKSR.DFLLRDY is set. If DFLLSYNC.READREQ is not written before a read, a synchronization will be started, and the bus will be halted until the synchronization is complete. Reading the DFLL48M registers when the DFLL48M is disabled will not halt the bus.

The prescaler counter used to trigger one-shot brown-out detections also operates asynchronously from the peripheral bus. As a consequence, the prescaler registers require synchronization when written or read. The synchronization results in a delay from when the initialization of the write or read operation begins until the operation is complete.

The write-synchronization is triggered by a write to the BOD33 control register. The Synchronization Ready bit (PCLKSR.B33SRDY) in the PCLKSR register will be cleared when the write-synchronization starts and set when the write-synchronization is complete. When the write-synchronization is ongoing (PCLKSR.B33SRDY is zero), an attempt to do any of the following will cause the peripheral bus to stall until the synchronization is complete:

- Writing to the BOD33control register

- Reading the BOD33 control register that was written

The user can either poll PCLKSR.B33SRDY or use the INTENSET.B33SRDY interrupts to check when the synchronization is complete. It is also possible to perform the next read/write operation and wait, as this next operation will be completed after the ongoing read/write operation is synchronized.

## 17.7. Register Summary

## 17.8. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16-, and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers require synchronization when read and/or written. Synchronization is denoted by the "Read-Synchronized" and/or "Write-Synchronized" property in each individual register description.

Optional write-protection by the Peripheral Access Controller (PAC) is denoted by the "PAC Write-Protection" property in each individual register description.

### 17.8.1. Interrupt Enable Clear

**Name:** INTENCLR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Write-Protected

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access					B33SRDY	BOD33DET	BOD33RDY	DFLLRCS
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bit 11 – B33SRDY: BOD33 Synchronization Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the BOD33 Synchronization Ready Interrupt Enable bit, which disables the BOD33 Synchronization Ready interrupt.

Value	Description
0	The BOD33 Synchronization Ready interrupt is disabled.
1	The BOD33 Synchronization Ready interrupt is enabled, and an interrupt request will be generated when the BOD33 Synchronization Ready Interrupt flag is set.

#### Bit 10 – BOD33DET: BOD33 Detection Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the BOD33 Detection Interrupt Enable bit, which disables the BOD33 Detection interrupt.

Value	Description
0	The BOD33 Detection interrupt is disabled.
1	The BOD33 Detection interrupt is enabled, and an interrupt request will be generated when the BOD33 Detection Interrupt flag is set.

**Bit 9 – BOD33RDY: BOD33 Ready Interrupt Enable**

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the BOD33 Ready Interrupt Enable bit, which disables the BOD33 Ready interrupt.

Value	Description
0	The BOD33 Ready interrupt is disabled.
1	The BOD33 Ready interrupt is enabled, and an interrupt request will be generated when the BOD33 Ready Interrupt flag is set.

**Bit 8 – DFLLRCS: DFLL Reference Clock Stopped Interrupt Enable**

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the DFLL Reference Clock Stopped Interrupt Enable bit, which disables the DFLL Reference Clock Stopped interrupt.

Value	Description
0	The DFLL Reference Clock Stopped interrupt is disabled.
1	The DFLL Reference Clock Stopped interrupt is enabled, and an interrupt request will be generated when the DFLL Reference Clock Stopped Interrupt flag is set.

**Bit 7 – DFLLLCKC: DFLL Lock Coarse Interrupt Enable**

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the DFLL Lock Coarse Interrupt Enable bit, which disables the DFLL Lock Coarse interrupt.

Value	Description
0	The DFLL Lock Coarse interrupt is disabled.
1	The DFLL Lock Coarse interrupt is enabled, and an interrupt request will be generated when the DFLL Lock Coarse Interrupt flag is set.

**Bit 6 – DFLLLCKF: DFLL Lock Fine Interrupt Enable**

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the DFLL Lock Fine Interrupt Enable bit, which disables the DFLL Lock Fine interrupt.

Value	Description
0	The DFLL Lock Fine interrupt is disabled.
1	The DFLL Lock Fine interrupt is enabled, and an interrupt request will be generated when the DFLL Lock Fine Interrupt flag is set.

**Bit 5 – DFLLOOB: DFLL Out Of Bounds Interrupt Enable**

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the DFLL Out Of Bounds Interrupt Enable bit, which disables the DFLL Out Of Bounds interrupt.

Value	Description
0	The DFLL Out Of Bounds interrupt is disabled.
1	The DFLL Out Of Bounds interrupt is enabled, and an interrupt request will be generated when the DFLL Out Of Bounds Interrupt flag is set.

#### Bit 4 – DFLLRDY: DFLL Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the DFLL Ready Interrupt Enable bit, which disables the DFLL Ready interrupt.

Value	Description
0	The DFLL Ready interrupt is disabled.
1	The DFLL Ready interrupt is enabled, and an interrupt request will be generated when the DFLL Ready Interrupt flag is set.

#### Bit 3 – OSC8MRDY: OSC8M Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the OSC8M Ready Interrupt Enable bit, which disables the OSC8M Ready interrupt.

Value	Description
0	The OSC8M Ready interrupt is disabled.
1	The OSC8M Ready interrupt is enabled, and an interrupt request will be generated when the OSC8M Ready Interrupt flag is set.

#### Bit 2 – OSC32KRDY: OSC32K Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the OSC32K Ready Interrupt Enable bit, which disables the OSC32K Ready interrupt.

Value	Description
0	The OSC32K Ready interrupt is disabled.
1	The OSC32K Ready interrupt is enabled, and an interrupt request will be generated when the OSC32K Ready Interrupt flag is set.

#### Bit 1 – XOSC32KRDY: XOSC32K Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the XOSC32K Ready Interrupt Enable bit, which enables the XOSC32K Ready interrupt.

Value	Description
0	The XOSC32K Ready interrupt is disabled.
1	The XOSC32K Ready interrupt is enabled, and an interrupt request will be generated when the XOSC32K Ready Interrupt flag is set.

**Bit 0 – XOSCRDY: XOSC Ready Interrupt Enable**

Writing a zero to this bit has no effect.

Writing a one to this bit will set the XOSC Ready Interrupt Enable bit, which enables the XOSC Ready interrupt.

Value	Description
0	The XOSC Ready interrupt is disabled.
1	The XOSC Ready interrupt is enabled, and an interrupt request will be generated when the XOSC Ready Interrupt flag is set.

## 17.8.2. Interrupt Enable Set

**Name:** INTENSET  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Write-Protected

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access					B33SRDY	BOD33DET	BOD33RDY	DFLLRCS
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bit 11 – B33SRDY: BOD33 Synchronization Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the BOD33 Synchronization Ready Interrupt Enable bit, which enables the BOD33 Synchronization Ready interrupt.

Value	Description
0	The BOD33 Synchronization Ready interrupt is disabled.
1	The BOD33 Synchronization Ready interrupt is enabled, and an interrupt request will be generated when the BOD33 Synchronization Ready Interrupt flag is set.

### Bit 10 – BOD33DET: BOD33 Detection Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the BOD33 Detection Interrupt Enable bit, which enables the BOD33 Detection interrupt.

Value	Description
0	The BOD33 Detection interrupt is disabled.
1	The BOD33 Detection interrupt is enabled, and an interrupt request will be generated when the BOD33 Detection Interrupt flag is set.

**Bit 9 – BOD33RDY: BOD33 Ready Interrupt Enable**

Writing a zero to this bit has no effect.

Writing a one to this bit will set the BOD33 Ready Interrupt Enable bit, which enables the BOD33 Ready interrupt.

Value	Description
0	The BOD33 Ready interrupt is disabled.
1	The BOD33 Ready interrupt is enabled, and an interrupt request will be generated when the BOD33 Ready Interrupt flag is set.

**Bit 8 – DFLLRCS: DFLL Reference Clock Stopped Interrupt Enable**

Writing a zero to this bit has no effect.

Writing a one to this bit will set the DFLL Reference Clock Stopped Interrupt Enable bit, which enables the DFLL Reference Clock Stopped interrupt.

Value	Description
0	The DFLL Reference Clock Stopped interrupt is disabled.
1	The DFLL Reference Clock Stopped interrupt is enabled, and an interrupt request will be generated when the DFLL Reference Clock Stopped Interrupt flag is set.

**Bit 7 – DFLLLCKC: DFLL Lock Coarse Interrupt Enable**

Writing a zero to this bit has no effect.

Writing a one to this bit will set the DFLL Lock Coarse Interrupt Enable bit, which enables the DFLL Lock Coarse interrupt.

Value	Description
0	The DFLL Lock Coarse interrupt is disabled.
1	The DFLL Lock Coarse interrupt is enabled, and an interrupt request will be generated when the DFLL Lock Coarse Interrupt flag is set.

**Bit 6 – DFLLLCKF: DFLL Lock Fine Interrupt Enable**

Writing a zero to this bit has no effect.

Writing a one to this bit will set the DFLL Lock Fine Interrupt Disable/Enable bit, disable the DFLL Lock Fine interrupt and set the corresponding interrupt request.

Value	Description
0	The DFLL Lock Fine interrupt is disabled.
1	The DFLL Lock Fine interrupt is enabled, and an interrupt request will be generated when the DFLL Lock Fine Interrupt flag is set.

**Bit 5 – DFLLOOB: DFLL Out Of Bounds Interrupt Enable**

Writing a zero to this bit has no effect.

Writing a one to this bit will set the DFLL Out Of Bounds Interrupt Enable bit, which enables the DFLL Out Of Bounds interrupt.

Value	Description
0	The DFLL Out Of Bounds interrupt is disabled.
1	The DFLL Out Of Bounds interrupt is enabled, and an interrupt request will be generated when the DFLL Out Of Bounds Interrupt flag is set.

#### Bit 4 – DFLLRDY: DFLL Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the DFLL Ready Interrupt Enable bit, which enables the DFLL Ready interrupt and set the corresponding interrupt request.

Value	Description
0	The DFLL Ready interrupt is disabled.
1	The DFLL Ready interrupt is enabled, and an interrupt request will be generated when the DFLL Ready Interrupt flag is set.

#### Bit 3 – OSC8MRDY: OSC8M Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the OSC8M Ready Interrupt Enable bit, which enables the OSC8M Ready interrupt.

Value	Description
0	The OSC8M Ready interrupt is disabled.
1	The OSC8M Ready interrupt is enabled, and an interrupt request will be generated when the OSC8M Ready Interrupt flag is set.

#### Bit 2 – OSC32KRDY: OSC32K Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the OSC32K Ready Interrupt Enable bit, which enables the OSC32K Ready interrupt.

Value	Description
0	The OSC32K Ready interrupt is disabled.
1	The OSC32K Ready interrupt is enabled, and an interrupt request will be generated when the OSC32K Ready Interrupt flag is set.

#### Bit 1 – XOSC32KRDY: XOSC32K Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the XOSC32K Ready Interrupt Enable bit, which enables the XOSC32K Ready interrupt.

Value	Description
0	The XOSC32K Ready interrupt is disabled.
1	The XOSC32K Ready interrupt is enabled, and an interrupt request will be generated when the XOSC32K Ready Interrupt flag is set.

**Bit 0 – XOSCRDY: XOSC Ready Interrupt Enable**

Writing a zero to this bit has no effect.

Writing a one to this bit will set the XOSC Ready Interrupt Enable bit, which enables the XOSC Ready interrupt.

Value	Description
0	The XOSC Ready interrupt is disabled.
1	The XOSC Ready interrupt is enabled, and an interrupt request will be generated when the XOSC Ready Interrupt flag is set.

### 17.8.3. Interrupt Flag Status and Clear

**Name:** INTFLAG

**Offset:** 0x08

**Reset:** 0x00000000

**Property:** -

Bit	31	30	29	28	27	26	25	24

DFLLCKC DFLLLCKF DFLLOOB DFLLRDY OSC8MRDY OSC32KRDY XOSC32KRDY XOSCRDY								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 31:12 – [19:0]: Reserved

These bits are unused and reserved for future use. For compatibility with future devices, always write these bits to zero when this register is written. These bits will always return zero when read.

#### Bit 11 – B33SRDY: BOD33 Synchronization Ready

This flag is cleared by writing a one to it.

This flag is set on a zero-to-one transition of the BOD33 Synchronization Ready bit in the Status register (PCLKSR.B33SRDY) and will generate an interrupt request if INTENSET.B33SRDY is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the BOD33 Synchronization Ready interrupt flag

#### Bit 10 – BOD33DET: BOD33 Detection

This flag is cleared by writing a one to it.

This flag is set on a zero-to-one transition of the BOD33 Detection bit in the Status register (PCLKSR.BOD33DET) and will generate an interrupt request if INTENSET.BOD33DET is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the BOD33 Detection interrupt flag.

#### Bit 9 – BOD33RDY: BOD33 Ready

This flag is cleared by writing a one to it.

This flag is set on a zero-to-one transition of the BOD33 Ready bit in the Status register (PCLKSR.BOD33RDY) and will generate an interrupt request if INTENSET.BOD33RDY is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the BOD33 Ready interrupt flag.

#### **Bit 8 – DFLLRCS: DFLL Reference Clock Stopped**

This flag is cleared by writing a one to it.

This flag is set on a zero-to-one transition of the DFLL Reference Clock Stopped bit in the Status register (PCLKSR.DFLLRCS) and will generate an interrupt request if INTENSET.DFLLRCS is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the DFLL Reference Clock Stopped interrupt flag.

#### **Bit 7 – DFLLLCKC: DFLL Lock Coarse**

This flag is cleared by writing a one to it.

This flag is set on a zero-to-one transition of the DFLL Lock Coarse bit in the Status register (PCLKSR.DFLLLCKC) and will generate an interrupt request if INTENSET.DFLLLCKC is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the DFLL Lock Coarse interrupt flag.

#### **Bit 6 – DFLLLCKF: DFLL Lock Fine**

This flag is cleared by writing a one to it.

This flag is set on a zero-to-one transition of the DFLL Lock Fine bit in the Status register (PCLKSR.DFLLLCKF) and will generate an interrupt request if INTENSET.DFLLLCKF is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the DFLL Lock Fine interrupt flag.

#### **Bit 5 – DFLLOOB: DFLL Out Of Bounds**

This flag is cleared by writing a one to it.

This flag is set on a zero-to-one transition of the DFLL Out Of Bounds bit in the Status register (PCLKSR.DFLLOOB) and will generate an interrupt request if INTENSET.DFLLOOB is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the DFLL Out Of Bounds interrupt flag.

#### **Bit 4 – DFLLRDY: DFLL Ready**

This flag is cleared by writing a one to it.

This flag is set on a zero-to-one transition of the DFLL Ready bit in the Status register (PCLKSR.DFLLRDY) and will generate an interrupt request if INTENSET.DFLLRDY is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the DFLL Ready interrupt flag.

#### **Bit 3 – OSC8MRDY: OSC8M Ready**

This flag is cleared by writing a one to it.

This flag is set on a zero-to-one transition of the OSC8M Ready bit in the Status register (PCLKSR.OSC8MRDY) and will generate an interrupt request if INTENSET.OSC8MRDY is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the OSC8M Ready interrupt flag.

#### **Bit 2 – OSC32KRDY: OSC32K Ready**

This flag is cleared by writing a one to it.

This flag is set on a zero-to-one transition of the OSC32K Ready bit in the Status register (PCLKSR.OSC32KRDY) and will generate an interrupt request if INTENSET.OSC32KRDY is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the OSC32K Ready interrupt flag.

#### **Bit 1 – XOSC32KRDY: XOSC32K Ready**

This flag is cleared by writing a one to it.

This flag is set on a zero-to-one transition of the XOSC32K Ready bit in the Status register (PCLKSR.XOSC32KRDY) and will generate an interrupt request if INTENSET.XOSC32KRDY is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the XOSC32K Ready interrupt flag.

#### **Bit 0 – XOSCRDY: XOSC Ready**

This flag is cleared by writing a one to it.

This flag is set on a zero-to-one transition of the XOSC Ready bit in the Status register (PCLKSR.XOSCRDY) and will generate an interrupt request if INTENSET.XOSCRDY is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the XOSC Ready interrupt flag.

#### 17.8.4. Power and Clocks Status

**Name:** PCLKSR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** -

Bit	31	30	29	28	27	26	25	24
	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	[ ]	[ ]	[ ]	[ ]	B33SRDY	BOD33DET	BOD33RDY	DFLLRCS
Access					R	R	R	R
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DFLLLCKC	DFLLLCKF	DFLLOOB	DFLLRDY	OSC8MRDY	OSC32KRDY	XOSC32KRDY	XOSCRDY
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

##### Bit 11 – B33SRDY: BOD33 Synchronization Ready

Value	Description
0	BOD33 synchronization is complete.
1	BOD33 synchronization is ongoing.

##### Bit 10 – BOD33DET: BOD33 Detection

Value	Description
0	No BOD33 detection.
1	BOD33 has detected that the I/O power supply is going below the BOD33 reference value.

##### Bit 9 – BOD33RDY: BOD33 Ready

Value	Description
0	BOD33 is not ready.
1	BOD33 is ready.

##### Bit 8 – DFLLRCS: DFLL Reference Clock Stopped

Value	Description
0	DFLL reference clock is running.
1	DFLL reference clock has stopped.

#### Bit 7 – DFLLLCKC: DFLL Lock Coarse

Value	Description
0	No DFLL coarse lock detected.
1	DFLL coarse lock detected.

#### Bit 6 – DFLLLCKF: DFLL Lock Fine

Value	Description
0	No DFLL fine lock detected.
1	DFLL fine lock detected.

#### Bit 5 – DFLLOOB: DFLL Out Of Bounds

Value	Description
0	No DFLL Out Of Bounds detected.
1	DFLL Out Of Bounds detected.

#### Bit 4 – DFLLRDY: DFLL Ready

This bit is cleared when the synchronization of registers between clock domains is complete.

This bit is set when the synchronization of registers between clock domains is started.

Value	Description
0	The Synchronization is ongoing.
1	The Synchronization is complete.

#### Bit 3 – OSC8MRDY: OSC8M Ready

Value	Description
0	OSC8M is not ready.
1	OSC8M is stable and ready to be used as a clock source.

#### Bit 2 – OSC32KRDY: OSC32K Ready

Value	Description
0	OSC32K is not ready.
1	OSC32K is stable and ready to be used as a clock source.

#### Bit 1 – XOSC32KRDY: XOSC32K Ready

<b>Value</b>	<b>Description</b>
0	XOSC32K is not ready.
1	XOSC32K is stable and ready to be used as a clock source.

#### **Bit 0 – XOSCRDY: XOSC Ready**

<b>Value</b>	<b>Description</b>
0	XOSC is not ready.
1	XOSC is stable and ready to be used as a clock source.

### 17.8.5. External Multipurpose Crystal Oscillator (XOSC) Control

**Name:** XOSC  
**Offset:** 0x10  
**Reset:** 0x0080  
**Property:** Write-Protected

Bit	15	14	13	12	11	10	9	8
	STARTUP[3:0]							GAIN[2:0]
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ONDEMAND	RUNSTDBY				XTALEN	ENABLE	
Access	R/W	R/W				R/W	R/W	
Reset	1	0				0	0	

#### Bits 15:12 – STARTUP[3:0]: Start-Up Time

These bits select start-up time for the oscillator according to the table below.

The OSCULP32K oscillator is used to clock the start-up counter.

STARTUP[3:0]	Number of OSCULP32K Clock Cycles	Number of XOSC Clock Cycles	Approximate Equivalent Time <sup>(1)(2)(3)</sup>
0x0	1	3	31µs
0x1	2	3	61µs
0x2	4	3	122µs
0x3	8	3	244µs
0x4	16	3	488µs
0x5	32	3	977µs
0x6	64	3	1953µs
0x7	128	3	3906µs
0x8	256	3	7813µs
0x9	512	3	15625µs
0xA	1024	3	31250µs
0xB	2048	3	62500µs
0xC	4096	3	125000µs
0xD	8192	3	250000µs
0xE	16384	3	500000µs
0xF	32768	3	1000000µs

**Note:**

1. Number of cycles for the start-up counter
2. Number of cycles for the synchronization delay, before PCLKSR.XOSCRDY is set.
3. Actual start-up time is n OSCULP32K cycles + 3 XOSC cycles, but given the time neglects the 3 XOSC cycles.

#### **Bit 11 – AMPGC: Automatic Amplitude Gain Control**

This bit must be set only after the XOSC has settled, indicated by the XOSC Ready flag in the PCLKSR register (PCLKSR.XOSCRDY).

Value	Description
0	The automatic amplitude gain control is disabled.
1	The automatic amplitude gain control is enabled. Amplitude gain will be automatically adjusted during Crystal Oscillator operation.

#### **Bits 10:8 – GAIN[2:0]: Oscillator Gain**

These bits select the gain for the oscillator. The listed maximum frequencies are recommendations, and might vary based on capacitive load and crystal characteristics. Setting this bit group has no effect when the Automatic Amplitude Gain Control is active.

GAIN[2:0]	Recommended Max Frequency
0x0	2MHz
0x1	4MHz
0x2	8MHz
0x3	16MHz
0x4	30MHz
0x5-0x7	Reserved

#### **Bit 7 – ONDEMAND: On Demand Control**

The On Demand operation mode allows an oscillator to be enabled or disabled, depending on peripheral clock requests.

In On Demand operation mode, i.e., if the XOSC.ONDEMAND bit has been previously written to one, the oscillator will be running only when requested by a peripheral. If there is no peripheral requesting the oscillator's clock source, the oscillator will be in a disabled state.

If On Demand is disabled, the oscillator will always be running when enabled.

In standby sleep mode, the On Demand operation is still active if the XOSC.RUNSTDBY bit is one. If XOSC.RUNSTDBY is zero, the oscillator is disabled.

Value	Description
0	The oscillator is always on, if enabled.
1	The oscillator is enabled when a peripheral is requesting the oscillator to be used as a clock source. The oscillator is disabled if no peripheral is requesting the clock source.

#### **Bit 6 – RUNSTDBY: Run in Standby**

This bit controls how the XOSC behaves during standby sleep mode:

Value	Description
0	The oscillator is disabled in standby sleep mode.
1	The oscillator is not stopped in standby sleep mode. If XOSC.ONDEMAND is one, the clock source will be running when a peripheral is requesting the clock. If XOSC.ONDEMAND is zero, the clock source will always be running in standby sleep mode.

#### Bit 2 – XTALEN: Crystal Oscillator Enable

This bit controls the connections between the I/O pads and the external clock or crystal oscillator:

Value	Description
0	External clock connected on XIN. XOUT can be used as general-purpose I/O.
1	Crystal connected to XIN/XOUT.

#### Bit 1 – ENABLE: Oscillator Enable

Value	Description
0	The oscillator is disabled.
1	The oscillator is enabled.

### 17.8.6. 32kHz External Crystal Oscillator (XOSC32K) Control

**Name:** XOSC32K  
**Offset:** 0x14  
**Reset:** 0x0080  
**Property:** Write-Protected

Bit	15	14	13	12	11	10	9	8
				WRTLOCK		STARTUP[2:0]		
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0
Bit	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W		R/W	R/W	R/W	R/W
Reset	1	0	0		0	0	0	0

#### Bit 12 – WRTLOCK: Write Lock

This bit locks the XOSC32K register for future writes to fix the XOSC32K configuration.

Value	Description
0	The XOSC32K configuration is not locked.
1	The XOSC32K configuration is locked.

#### Bits 10:8 – STARTUP[2:0]: Oscillator Start-Up Time

These bits select the start-up time for the oscillator.

The OSCULP32K oscillator is used to clock the start-up counter.

Table 17-3. Start-Up Time for 32kHz External Crystal Oscillator

STARTUP[2:0]	Number of OSCULP32K Clock Cycles	Number of XOSC32K Clock Cycles	Approximate Equivalent Time (OSCULP = 32kHz) <sup>(1)(2)(3)</sup>
0x0	1	3	122µs
0x1	32	3	1068µs
0x2	2048	3	62592µs
0x3	4096	3	125092µs
0x4	16384	3	500092µs
0x5	32768	3	1000092µs
0x6	65536	3	2000092µs
0x7	131072	3	4000092µs

Notes: 1. Number of cycles for the start-up counter.

2. Number of cycles for the synchronization delay, before PCLKSR.XOSC32KRDY is set.

3. Start-up time is n OSCULP32K cycles + 3 XOSC32K cycles.

### **Bit 7 – ONDEMAND: On Demand Control**

The On Demand operation mode allows an oscillator to be enabled or disabled depending on peripheral clock requests.

In On Demand operation mode, i.e., if the ONDEMAND bit has been previously written to one, the oscillator will only be running when requested by a peripheral. If there is no peripheral requesting the oscillator's clock source, the oscillator will be in a disabled state.

If On Demand is disabled the oscillator will always be running when enabled.

In standby sleep mode, the On Demand operation is still active if the XOSC32K.RUNSTDBY bit is one. If XOSC32K.RUNSTDBY is zero, the oscillator is disabled.

Value	Description
0	The oscillator is always on, if enabled.
1	The oscillator is enabled when a peripheral is requesting the oscillator to be used as a clock source. The oscillator is disabled if no peripheral is requesting the clock source.

### **Bit 6 – RUNSTDBY: Run in Standby**

This bit controls how the XOSC32K behaves during standby sleep mode:

Value	Description
0	The oscillator is disabled in standby sleep mode.
1	The oscillator is not stopped in standby sleep mode. If XOSC32K.ONDEMAND is one, the clock source will be running when a peripheral is requesting the clock. If XOSC32K.ONDEMAND is zero, the clock source will always be running in standby sleep mode.

### **Bit 5 – AAMPEN: Automatic Amplitude Control Enable**

Value	Description
0	The automatic amplitude control for the crystal oscillator is disabled.
1	The automatic amplitude control for the crystal oscillator is enabled.

### **Bit 3 – EN32K: 32kHz Output Enable**

This bit controls the connections between the I/O pads and the external clock or crystal oscillator:

Value	Description
0	The 32kHz output is disabled.
1	The 32kHz output is enabled.

### **Bit 2 – XTALEN: Crystal Oscillator Enable**

This bit controls the connections between the I/O pads and the external clock or crystal oscillator:

Value	Description
0	External clock connected on XIN32. XOUT32 can be used as general-purpose I/O.
1	Crystal connected to XIN32/XOUT32.

### **Bit 1 – ENABLE: Oscillator Enable**

Value	Description
0	The oscillator is disabled.
1	The oscillator is enabled.

### 17.8.7. 32kHz Internal Oscillator (OSC32K) Control

**Name:** OSC32K  
**Offset:** 0x18  
**Reset:** 0x003F0080  
**Property:** Write-Protected

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
CALIB[6:0]								
Access	R/W							
Reset	0							
Bit	15	14	13	12	11	10	9	8
STARTUP[2:0]								
Access	R/W							
Reset	0							
Bit	7	6	5	4	3	2	1	0
ONDEMAND RUNSTDBY								
Access	R/W	R/W	R/W					
Reset	1	0	0					

#### Bits 22:16 – CALIB[6:0]: Oscillator Calibration

These bits control the oscillator calibration.

This value must be written by the user.

Factory calibration values can be loaded from the non-volatile memory.

#### Bit 12 – WRTLOCK: Write Lock

This bit locks the OSC32K register for future writes to fix the OSC32K configuration.

Value	Description
0	The OSC32K configuration is not locked.
1	The OSC32K configuration is locked.

#### Bits 10:8 – STARTUP[2:0]: Oscillator Start-Up Time

These bits select start-up time for the oscillator.

The OSCULP32K oscillator is used as input clock to the startup counter.

**Table 17-4. Start-Up Time for 32kHz Internal Oscillator**

STARTUP[2:0]	Number of OSC32K clock cycles	Approximate Equivalent Time (OSCULP= 32 kHz) <sup>(1)(2)(3)</sup>
0x0	3	92µs
0x1	4	122µs
0x2	6	183µs
0x3	10	305µs
0x4	18	549µs
0x5	34	1038µs
0x6	66	2014µs
0x7	130	3967µs

Notes: 1. Number of cycles for the start-up counter.

2. Number of cycles for the synchronization delay, before PCLKSR.OSC32KRDY is set.

3. Start-up time is n OSC32K cycles + 2 OSC32K cycles.

#### **Bit 7 – ONDEMAND: On Demand Control**

The On Demand operation mode allows an oscillator to be enabled or disabled depending on peripheral clock requests.

In On Demand operation mode, i.e., if the ONDEMAND bit has been previously written to one, the oscillator will only be running when requested by a peripheral. If there is no peripheral requesting the oscillator's clock source, the oscillator will be in a disabled state.

If On Demand is disabled the oscillator will always be running when enabled.

In standby sleep mode, the On Demand operation is still active if the OSC32K.RUNSTDBY bit is one. If OSC32K.RUNSTDBY is zero, the oscillator is disabled.

Value	Description
0	The oscillator is always on, if enabled.
1	The oscillator is enabled when a peripheral is requesting the oscillator to be used as a clock source. The oscillator is disabled if no peripheral is requesting the clock source.

#### **Bit 6 – RUNSTDBY: Run in Standby**

This bit controls how the OSC32K behaves during standby sleep mode:

Value	Description
0	The oscillator is disabled in standby sleep mode.
1	The oscillator is not stopped in standby sleep mode. If OSC32K.ONDEMAND is one, the clock source will be running when a peripheral is requesting the clock. If OSC32K.ONDEMAND is zero, the clock source will always be running in standby sleep mode.

#### **Bit 2 – EN32K: 32kHz Output Enable**

<b>Value</b>	<b>Description</b>
0	The 32kHz output is disabled.
1	The 32kHz output is enabled.
0	The oscillator is disabled.
1	The oscillator is enabled.

#### **Bit 1 – ENABLE: Oscillator Enable**

<b>Value</b>	<b>Description</b>
0	The oscillator is disabled.
1	The oscillator is enabled.

### 17.8.8. 32kHz Ultra Low Power Internal Oscillator (OSCULP32K) Control

**Name:** OSCULP32K  
**Offset:** 0x1C  
**Reset:** 0xXX  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0					
	WRTLOCK					CALIB[4:0]							
Access	R/W			R/W	R/W	R/W	R/W	R/W					
Reset	0			0	0	0	0	0					

#### Bit 7 – WRTLOCK: Write Lock

This bit locks the OSCULP32K register for future writes to fix the OSCULP32K configuration.

Value	Description
0	The OSCULP32K configuration is not locked.
1	The OSCULP32K configuration is locked.

#### Bits 4:0 – CALIB[4:0]: Oscillator Calibration

These bits control the oscillator calibration.

These bits are loaded from Flash Calibration at startup.

### 17.8.9. 8MHz Internal Oscillator (OSC8M) Control

**Name:** OSC8M  
**Offset:** 0x20  
**Reset:** 0xFFFF0382  
**Property:** Write-Protected

Bit	31	30	29	28	27	26	25	24
	FRANGE[1:0]							
Access	R/W	R/W			R/W	R/W	R/W	R/W
Reset	0	0			0	0	0	0
Bit	23	22	21	20	19	18	17	16
	CALIB[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	PRESC[1:0]							
Access							R/W	R/W
Reset							1	1
Bit	7	6	5	4	3	2	1	0
	ONDEMAND	RUNSTDBY					ENABLE	
Access	R/W	R/W					R/W	
Reset	1	0					1	

#### Bits 31:30 – FRANGE[1:0]: Oscillator Frequency Range

These bits control the oscillator frequency range according to the table below. These bits are loaded from Flash Calibration at startup.

FRANGE[1:0]	Description
0x0	4 to 6MHz
0x1	6 to 8MHz
0x2	8 to 11MHz
0x3	11 to 15MHz

#### Bits 27:16 – CALIB[11:0]: Oscillator Calibration

These bits control the oscillator calibration. The calibration field is split in two:

CALIB[11:6] is for temperature calibration

CALIB[5:0] is for overall process calibration

These bits are loaded from Flash Calibration at startup.

#### Bits 9:8 – PRESC[1:0]: Oscillator Prescaler

These bits select the oscillator prescaler factor setting according to the table below.

PRESC[1:0]	Description
0x0	1
0x1	2
0x2	4
0x3	8

#### Bit 7 – ONDEMAND: On Demand Control

The On Demand operation mode allows an oscillator to be enabled or disabled depending on peripheral clock requests.

In On Demand operation mode, i.e., if the ONDEMAND bit has been previously written to one, the oscillator will only be running when requested by a peripheral. If there is no peripheral requesting the oscillator's clock source, the oscillator will be in a disabled state.

If On Demand is disabled the oscillator will always be running when enabled.

In standby sleep mode, the On Demand operation is still active if the OSC8M.RUNSTDBY bit is one. If OSC8M.RUNSTDBY is zero, the oscillator is disabled.

Value	Description
0	The oscillator is always on, if enabled.
1	The oscillator is enabled when a peripheral is requesting the oscillator to be used as a clock source. The oscillator is disabled if no peripheral is requesting the clock source.

#### Bit 6 – RUNSTDBY: Run in Standby

This bit controls how the OSC8M behaves during standby sleep mode:

Value	Description
0	The oscillator is disabled in standby sleep mode.
1	The oscillator is not stopped in standby sleep mode. If OSC8M.ONDEMAND is one, the clock source will be running when a peripheral is requesting the clock. If OSC8M.ONDEMAND is zero, the clock source will always be running in standby sleep mode.

#### Bit 1 – ENABLE: Oscillator Enable

The user must ensure that the OSC8M is fully disabled before enabling it, and that the OSC8M is fully enabled before disabling it by reading OSC8M.ENABLE.

Value	Description
0	The oscillator is disabled or being enabled.
1	The oscillator is enabled or being disabled.

### 17.8.10. DFLL48M Control

**Name:** DFLLCTRL

**Offset:** 0x24

**Reset:** 0x0080

**Property:** Write-Protected, Write-Synchronized

Bit	15	14	13	12	11	10	9	8
Access							QLDIS	CCDIS
Reset							0	0
Bit	7	6	5	4	3	2	1	0
Access	ONDEMAND			LLAW	STABLE	MODE	ENABLE	
Reset	R/W			R/W	R/W	R/W	R/W	
	1			0	0	0	0	

#### Bit 9 – QLDIS: Quick Lock Disable

Value	Description
0	Quick Lock is enabled.
1	Quick Lock is disabled.

#### Bit 8 – CCDIS: Chill Cycle Disable

Value	Description
0	Chill Cycle is enabled.
1	Chill Cycle is disabled.

#### Bit 7 – ONDEMAND: On Demand Control

The On Demand operation mode allows an oscillator to be enabled or disabled depending on peripheral clock requests.

In On Demand operation mode, i.e., if the ONDEMAND bit has been previously written to one, the oscillator will only be running when requested by a peripheral. If there is no peripheral requesting the oscillator's clock source, the oscillator will be in a disabled state.

If On Demand is disabled the oscillator will always be running when enabled.

In standby sleep mode, the On Demand operation is still active if the DFLLCTRL.RUNSTDBY bit is one. If DFLLCTRL.RUNSTDBY is zero, the oscillator is disabled.

Value	Description
0	The oscillator is always on, if enabled.
1	The oscillator is enabled when a peripheral is requesting the oscillator to be used as a clock source. The oscillator is disabled if no peripheral is requesting the clock source.

#### Bit 4 – LLAW: Lose Lock After Wake

Value	Description
0	Locks will not be lost after waking up from sleep modes if the DFLL clock has been stopped.
1	Locks will be lost after waking up from sleep modes if the DFLL clock has been stopped.

#### Bit 3 – STABLE: Stable DFLL Frequency

Value	Description
0	FINE calibration tracks changes in output frequency.
1	FINE calibration register value will be fixed after a fine lock.

#### Bit 2 – MODE: Operating Mode Selection

Value	Description
0	The DFLL operates in open-loop operation.
1	The DFLL operates in closed-loop operation.

#### Bit 1 – ENABLE: DFLL Enable

Due to synchronization, there is delay from updating the register until the peripheral is enabled/disabled. The value written to DFLLCTRL.ENABLE will read back immediately after written.

Value	Description
0	The DFLL oscillator is disabled.
1	The DFLL oscillator is enabled.

### 17.8.11. DFLL48M Value

**Name:** DFLLVAL  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read-Synchronized, Write-Protected

Bit	31	30	29	28	27	26	25	24
DIFF[15:8]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
DIFF[7:0]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
COARSE[5:0]						FINE[9:8]		
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
FINE[7:0]								
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:16 – DIFF[15:0]: Multiplication Ratio Difference

In closed-loop mode (DFLLCTRL.MODE is written to one), this bit group indicates the difference between the ideal number of DFLL cycles and the counted number of cycles. This value is not updated in open-loop mode, and should be considered invalid in that case.

#### Bits 15:10 – COARSE[5:0]: Coarse Value

Set the value of the Coarse Calibration register. In closed-loop mode, this field is read-only.

#### Bits 9:0 – FINE[9:0]: Fine Value

Set the value of the Fine Calibration register. In closed-loop mode, this field is read-only.

### 17.8.12. DFLL48M Multiplier

**Name:** DFLLMUL  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Write-Protected

Bit	31	30	29	28	27	26	25	24
	CSTEP[5:0]							FSTEP[9:8]
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	FSTEP[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	MUL[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MUL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:26 – CSTEP[5:0]: Coarse Maximum Step

This bit group indicates the maximum step size allowed during coarse adjustment in closed-loop mode. When adjusting to a new frequency, the expected output frequency overshoot depends on this step size.

#### Bits 25:16 – FSTEP[9:0]: Fine Maximum Step

This bit group indicates the maximum step size allowed during fine adjustment in closed-loop mode. When adjusting to a new frequency, the expected output frequency overshoot depends on this step size.

#### Bits 15:0 – MUL[15:0]: DFLL Multiply Factor

This field determines the ratio of the CLK\_DFLL output frequency to the CLK\_DFLL\_REF input frequency. Writing to the MUL bits will cause locks to be lost and the fine calibration value to be reset to its midpoint.

### 17.8.13. DFLL48M Synchronization

**Name:** DFLLSYNC

**Offset:** 0x30

**Reset:** 0x00

**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
	READREQ							
Access	W							
Reset	0							

#### Bit 7 – READREQ: Read Request

To be able to read the current value of DFLLVAL in closed-loop mode, this bit should be written to one. The updated value is available in DFLLVAL when PCLKSR.DFLLRDY is set.

#### 17.8.14. 3.3V Brown-Out Detector (BOD33) Control

**Name:** BOD33

**Offset:** 0x34

**Reset:** 0x00XX00XX

**Property:** Write-Protected, Write-Synchronized

**Bits 21:16 – LEVEL[5:0]: BOD33 Threshold Level**

This field sets the triggering voltage threshold for the BOD33. See the *Electrical Characteristics* for actual voltage levels. Note that any change to the LEVEL field of the BOD33 register should be done when the BOD33 is disabled in order to avoid spurious resets or interrupts.

These bits are loaded from Flash User Row at start-up. Refer to *NVM User Row Mapping* for more details.

### **Bits 15:12 – PSEL[3:0]: Prescaler Select**

Selects the prescaler divide-by output for the BOD33 sampling mode according to the table below. The input clock comes from the OSCULP32K 1kHz output.

PSEL[3:0]	Name	Description
0x0	DIV2	Divide clock by 2
0x1	DIV4	Divide clock by 4
0x2	DIV8	Divide clock by 8
0x3	DIV16	Divide clock by 16
0x4	DIV32	Divide clock by 32
0x5	DIV64	Divide clock by 64
0x6	DIV128	Divide clock by 128

PSEL[3:0]	Name	Description
0x7	DIV256	Divide clock by 256
0x8	DIV512	Divide clock by 512
0x9	DIV1K	Divide clock by 1024
0xA	DIV2K	Divide clock by 2048
0xB	DIV4K	Divide clock by 4096
0xC	DIV8K	Divide clock by 8192
0xD	DIV16K	Divide clock by 16384
0xE	DIV32K	Divide clock by 32768
0xF	DIV64K	Divide clock by 65536

#### Bit 9 – CEN: Clock Enable

Writing a zero to this bit will stop the BOD33 sampling clock.

Writing a one to this bit will start the BOD33 sampling clock.

Value	Description
0	The BOD33 sampling clock is either disabled and stopped, or enabled but not yet stable.
1	The BOD33 sampling clock is either enabled and stable, or disabled but not yet stopped.

#### Bit 8 – MODE: Operation Mode

Value	Description
0	The BOD33 operates in continuous mode.
1	The BOD33 operates in sampling mode.

#### Bit 6 – RUNSTDBY: Run in Standby

Value	Description
0	The BOD33 is disabled in standby sleep mode.
1	The BOD33 is enabled in standby sleep mode.

#### Bits 4:3 – ACTION[1:0]: BOD33 Action

These bits are used to select the BOD33 action when the supply voltage crosses below the BOD33 threshold.

These bits are loaded from Flash User Row at start-up.

ACTION[1:0]	Name	Description
0x0	NONE	No action
0x1	RESET	The BOD33 generates a reset
0x2	INTERRUPT	The BOD33 generates an interrupt
0x3		Reserved

**Bit 2 – HYST: Hysteresis**

This bit indicates whether hysteresis is enabled for the BOD33 threshold voltage:

This bit is loaded from Flash User Row at start-up. Refer to *NVM User Row Mapping* for more details.

Value	Description
0	No hysteresis.
1	Hysteresis enabled.

**Bit 1 – ENABLE: Enable**

This bit is loaded from Flash User Row at startup. Refer to *NVM User Row Mapping* for more details.

Value	Description
0	BOD33 is disabled.
1	BOD33 is enabled.

### 17.8.15. Voltage Regulator System (VREG) Control

**Name:** VREG  
**Offset:** 0x3C  
**Reset:** 0x0X00  
**Property:** Write-Protected

Bit	15	14	13	12	11	10	9	8
			FORCELDO					
Access			R/W					
Reset			0					
Bit	7	6	5	4	3	2	1	0
		RUNSTDBY						
Access			R/W					
Reset			0					

#### Bit 13 – FORCELDO: Force LDO Voltage Regulator

Value	Description
0	The voltage regulator is in low power and low drive configuration in standby sleep mode.
1	The voltage regulator is in low power and high drive configuration in standby sleep mode.

#### Bit 6 – RUNSTDBY: Run in Standby

Value	Description
0	The voltage regulator is in low power configuration in standby sleep mode.
1	The voltage regulator is in normal configuration in standby sleep mode.

### 17.8.16. Voltage References System (VREF) Control

**Name:** VREF  
**Offset:** 0x40  
**Reset:** 0x0XXX0000  
**Property:** Write-Protected

Bit	31	30	29	28	27	26	25	24
	CALIB[10:8]							
Access					R/W	R/W	R/W	
Reset					0	0	0	
Bit	23	22	21	20	19	18	17	16
	CALIB[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access					R/W	R/W		
Reset					0	0		

#### Bits 26:16 – CALIB[10:0]: Bandgap Voltage Generator Calibration

These bits are used to calibrate the output level of the bandgap voltage reference. These bits are loaded from Flash Calibration Row at startup.

#### Bit 2 – BGOUTEN: Bandgap Output Enable

Value	Description
0	The bandgap output is not available as an ADC input channel.
1	The bandgap output is routed to an ADC input channel.

#### Bit 1 – TSEN: Temperature Sensor Enable

Value	Description
0	Temperature sensor is disabled.
1	Temperature sensor is enabled and routed to an ADC input channel.

## 18. WDT – Watchdog Timer

### 18.1. Overview

The Watchdog Timer (WDT) is a system function for monitoring correct program operation. It makes it possible to recover from error situations such as runaway or deadlocked code. The WDT is configured to a predefined time-out period, and is constantly running when enabled. If the WDT is not cleared within the time-out period, it will issue a system reset. An early-warning interrupt is available to indicate an upcoming watchdog time-out condition.

The window mode makes it possible to define a time slot (or window) inside the total time-out period during which the WDT must be cleared. If the WDT is cleared outside this window, either too early or too late, a system reset will be issued. Compared to the normal mode, this can also catch situations where a code error causes the WDT to be cleared frequently.

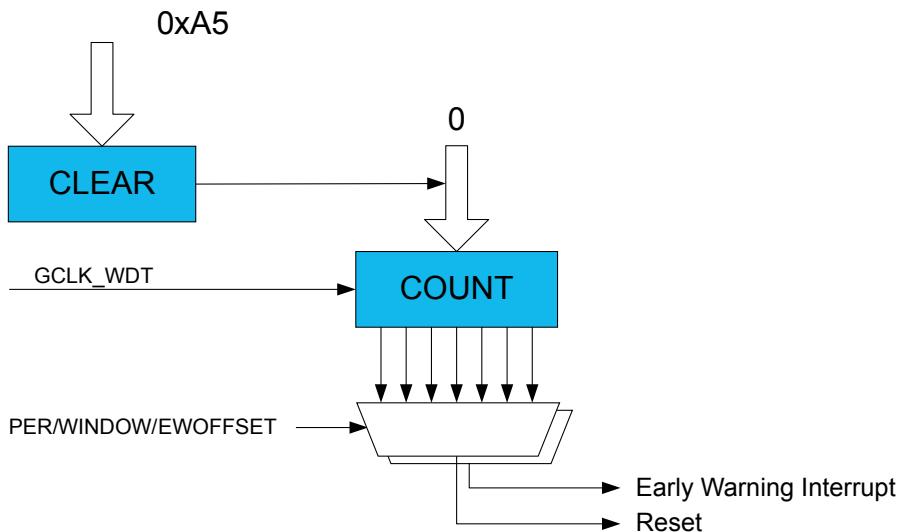

When enabled, the WDT will run in active mode and all sleep modes. It is asynchronous and runs from a CPU-independent clock source. The WDT will continue operation and issue a system reset or interrupt even if the main clocks fail.

### 18.2. Features

- Issues a system reset if the Watchdog Timer is not cleared before its time-out period
- Early Warning interrupt generation
- Asynchronous operation from dedicated oscillator
- Two types of operation:
  - Normal mode
  - Window mode
- Selectable time-out periods
  - From 8 cycles to 16,000 cycles in normal mode
  - From 16 cycles to 32,000 cycles in window mode
- Always-on capability

### 18.3. Block Diagram

Figure 18-1. WDT Block Diagram

### 18.4. Signal Description

Not applicable.

### 18.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly, as described below.

#### 18.5.1. I/O Lines

Not applicable.

#### 18.5.2. Power Management

The WDT can continue to operate in any sleep mode where the selected source clock is running. The WDT interrupts can be used to wake up the device from sleep modes. The events can trigger other operations in the system without exiting sleep modes.

##### Related Links

[PM – Power Manager](#) on page 129

#### 18.5.3. Clocks

The WDT bus clock (CLK\_WDT\_APB) is enabled by default, and can be enabled and disabled in the Power Manager. Refer to [PM – Power Manager](#) for details.

A generic clock (GCLK\_WDT) is required to clock the WDT. This clock must be configured and enabled in the Generic Clock Controller before using the WDT. Refer to [GCLK – Generic Clock Controller](#) for details. This generic clock is asynchronous to the user interface clock (CLK\_WDT\_APB). Due to this asynchronicity, accessing certain registers will require synchronization between the clock domains. Refer to [Synchronization](#) for further details.

GCLK\_WDT is intended to be sourced from the clock of the internal ultra-low-power (ULP) oscillator. Due to the ultralow-power design, the oscillator is not very accurate, and so the exact time-out period may vary from device to device. This variation must be kept in mind when designing software that uses the

WDT to ensure that the time-out periods used are valid for all devices. For more information on ULP oscillator accuracy, consult the *Ultra Low Power Internal 32kHz RC Oscillator (OSCULP32K) Characteristics*.

GCLK\_WDT can also be clocked from other sources if a more accurate clock is needed, but at the cost of higher power consumption.

#### 18.5.4. Interrupts

The interrupt request line is connected to the interrupt controller. Using the WDT interrupt(s) requires the interrupt controller to be configured first.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

#### 18.5.5. Events

Not applicable.

#### 18.5.6. Debug Operation

When the CPU is halted in debug mode, this peripheral will halt normal operation. This peripheral can be forced to continue operation during debugging.

#### 18.5.7. Register Access Protection

Registers with write-access can be optionally write-protected by the Peripheral Access Controller (PAC), except the following:

- Interrupt Flag Status and Clear register (INTFLAG)

**Note:** Optional write-protection is indicated by the "PAC Write-Protection" property in the register description.

#### Related Links

[PAC - Peripheral Access Controller](#) on page 45

#### 18.5.8. Analog Connections

Not applicable.

### 18.6. Functional Description

#### 18.6.1. Principle of Operation

The Watchdog Timer (WDT) is a system for monitoring correct program operation, making it possible to recover from error situations such as runaway code, by issuing a Reset. When enabled, the WDT is a constantly running timer that is configured to a predefined time-out period. Before the end of the time-out period, the WDT should be set back, or else, a system Reset is issued.

The WDT has two modes of operation, Normal mode and Window mode. Both modes offer the option of Early Warning interrupt generation. The description for each of the basic modes is given below. The

settings in the Control register (CTRL) and the Interrupt Enable register (handled by INTENCLR/SET) determine the mode of operation:

**Table 18-1. WDT Operating Modes**

CTRL.ENABLE	CTRL.WEN	INTENSET.EW	Mode
0	x	x	Stopped
1	0	0	Normal
1	0	1	Normal with Early Warning interrupt
1	1	0	Window
1	1	1	Window with Early Warning interrupt

## 18.6.2. Basic Operation

### 18.6.2.1. Initialization

The following bits are enable-protected:

- Window Mode Enable in the Control register (CTRL.WEN)
- Always-On in the Control register (CTRL.ALWAYSON)

The following registers are enable-protected:

- Configuration register (CONFIG)
- Early Warning Interrupt Control register (EWCTRL)

Any writes to these bits or registers when the WDT is enabled or is being enabled (CTRL.ENABLE=1) will be discarded. Writes to these registers while the WDT is being disabled will be completed after the disabling is complete.

Enable-protection is denoted by the Enable-Protected property in the register description.

Initialization of the WDT can be done only while the WDT is disabled. The WDT is configured by defining the required Time-Out Period bits in the Configuration register (CONFIG.PER). If window-mode operation is required, the Window Enable bit in the Control register (CTRL.WEN) must be written to one and the Window Period bits in the Configuration register (CONFIG.WINDOW) must be defined.

#### Normal Mode

- Defining the required Time-Out Period bits in the Configuration register (CONFIG.PER).

#### Normal Mode with Early Warning interrupt

- Defining the required Time-Out Period bits in the Configuration register (CONFIG.PER).
- Defining Early Warning Interrupt Time Offset bits in the Early Warning Interrupt Control register (EWCTRL.EWOFFSET).
- Setting Early Warning Interrupt Enable bit in the Interrupt Enable Set register (INTENSET.EW).

#### Window Mode

- Defining Time-Out Period bits in the Configuration register (CONFIG.PER).
- Defining Window Mode Time-Out Period bits in the Configuration register (CONFIG.WINDOW).
- Setting Window Enable bit in the Control register (CTRL.WEN).

### **Window Mode with Early Warning interrupt**

- Defining Time-Out Period bits in the Configuration register (CONFIG.PER).
- Defining Window Mode Time-Out Period bits in the Configuration register (CONFIG.WINDOW).
- Setting Window Enable bit in the Control register (CTRL.WEN).
- Defining Early Warning Interrupt Time Offset bits in the Early Warning Interrupt Control register (EWCTRL.EWOFFSET).
- Setting Early Warning Interrupt Enable bit in the Interrupt Enable Set register (INTENSET.EW).

#### **18.6.2.2. Configurable Reset Values**

After a Power-on Reset, some registers will be loaded with initial values from the NVM User Row. Refer to *NVM User Row Mapping* for more details.

This encompasses the following bits and bit groups:

- Enable bit in the Control register, CTRL.ENABLE
- Always-On bit in the Control register, CTRL.ALWAYSON
- Watchdog Timer Windows Mode Enable bit in the Control register, CTRL.WEN
- Watchdog Timer Windows Mode Time-Out Period bits in the Configuration register, CONFIG.WINDOW
- Time-Out Period in the Configuration register, CONFIG.PER
- Early Warning Interrupt Time Offset bits in the Early Warning Interrupt Control register, EWCTRL.EWOFFSET

For more information about fuse locations, see *NVM User Row Mapping*.

#### **Related Links**

[NVM User Row Mapping](#) on page 37

#### **18.6.2.3. Enabling and Disabling**

The WDT is enabled by writing a '1' to the Enable bit in the Control register (CTRL.ENABLE). The WDT is disabled by writing a '0' to CTRL.ENABLE.

The WDT can be disabled only if the Always-On bit in the Control register (CTRL.ALWAYSON) is '0'.

#### **18.6.2.4. Normal Mode**

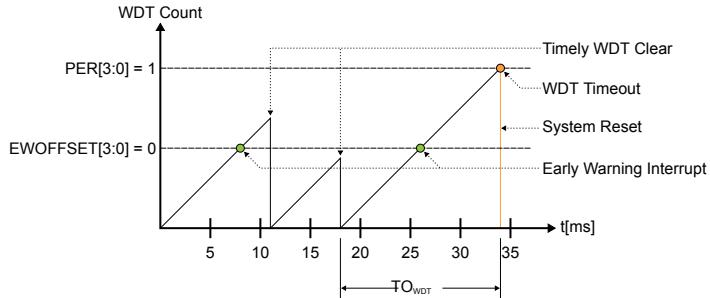

In Normal mode operation, the length of a time-out period is configured in CONFIG.PER. The WDT is enabled by writing a '1' to the Enable bit in the Control register (CTRL.ENABLE). Once enabled, the WDT will issue a system reset if a time-out occurs. This can be prevented by clearing the WDT at any time during the time-out period.

The WDT is cleared and a new WDT time-out period is started by writing 0xA5 to the Clear register (CLEAR). Writing any other value than 0xA5 to CLEAR will issue an immediate system reset.

There are 12 possible WDT time-out ( $T_{O_{WDT}}$ ) periods, selectable from 8ms to 16s.

By default, the early warning interrupt is disabled. If it is desired, the Early Warning Interrupt Enable bit in the Interrupt Enable register (INTENSET.EW) must be written to '1'. The Early Warning Interrupt is disabled again by writing a '1' to the Early Warning Interrupt bit in the Interrupt Enable Clear register (INTENCLR.EW). If the Early Warning Interrupt is enabled, an interrupt is generated prior to a WDT time-out condition. In Normal mode, the Early Warning Offset bits in the Early Warning Interrupt Control register, EWCTRL.EWOFFSET, define the time when the early warning interrupt occurs. The Normal mode operation is illustrated in the figure Normal-Mode Operation.

**Figure 18-2. Normal-Mode Operation**

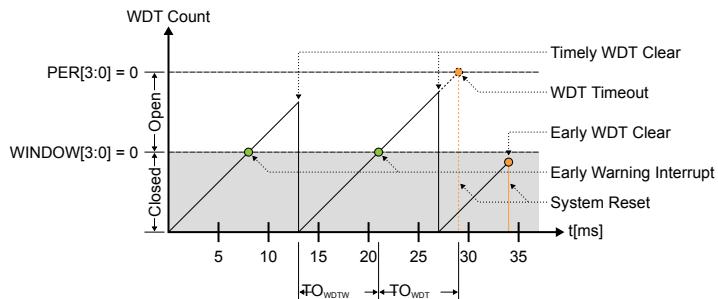

#### 18.6.2.5. Window Mode

In Window mode operation, the WDT uses two different time specifications: the WDT can only be cleared by writing 0xA5 to the CLEAR register *after* the closed window time-out period ( $TO_{WDTW}$ ), during the subsequent Normal time-out period ( $TO_{WDT}$ ). If the WDT is cleared before the time window opens (before  $TO_{WDTW}$  is over), the WDT will issue a system reset. Both parameters  $TO_{WDTW}$  and  $TO_{WDT}$  are periods in a range from 8ms to 16s, so the total duration of the WDT time-out period is the sum of the two parameters. The closed window period is defined by the Window Period bits in the Configuration register (CONFIG.WINDOW), and the open window period is defined by the Period bits in the Configuration register (CONFIG.PER).

By default, the Early Warning interrupt is disabled. If it is desired, the Early Warning Interrupt Enable bit in the Interrupt Enable register (INTENSET.EW) must be written to '1'. The Early Warning Interrupt is disabled again by writing a '1' to the Early Warning Interrupt bit in the Interrupt Enable Clear (INTENCLR.EW) register. If the Early Warning interrupt is enabled in Window mode, the interrupt is generated at the start of the open window period, i.e. after  $TO_{WDTW}$ . The Window mode operation is illustrated in figure Window-Mode Operation.

**Figure 18-3. Window-Mode Operation**

#### 18.6.3. Additional Features

##### 18.6.3.1. Always-On Mode

The Always-On mode is enabled by setting the Always-On bit in the Control register (CTRLA.ALWAYSON=1). When the Always-On mode is enabled, the WDT runs continuously, regardless of the state of CTRL.ENABLE. Once written, the Always-On bit can only be cleared by a power-on reset. The Configuration (CONFIG) and Early Warning Control (EWCTRL) registers are read-only registers while the CTRL.ALWAYSON bit is set. Thus, the time period configuration bits (CONFIG.PER, CONFIG.WINDOW, EWCTRL.EWOFFSET) of the WDT cannot be changed.

Enabling or disabling Window mode operation by writing the Window Enable bit (CTRLA.WEN) is allowed while in Always-On mode, but note that CONFIG.PER cannot be changed.

The CTRL.ALWAYSON bit must never be set to one by software if any of the following conditions is true:

1. The GCLK\_WDT is disabled
2. The clock generator for the GCLK\_WDT is disabled
3. The source clock of the clock generator for the GCLK\_WDT is disabled or off

The Interrupt Clear and Interrupt Set registers are accessible in the Always-On mode. The Early Warning interrupt can still be enabled or disabled while in the Always-On mode, but note that EWCTRL.EWOFFSET cannot be changed.

**Table 18-2. WDT Operating Modes With Always-On**

WEN	Interrupt enable	Mode
0	0	Always-on and normal mode
0	1	Always-on and normal mode with Early Warning interrupt
1	0	Always-on and window mode
1	1	Always-on and window mode with Early Warning interrupt

#### 18.6.4. Interrupts

The WDT has the following interrupt source:

- Early Warning (EW)

Each interrupt source has an interrupt flag associated with it. The interrupt flag in the Interrupt Flag Status and Clear (INTFLAG) register is set when the interrupt condition occurs. Each interrupt can be individually enabled by writing a '1' to the corresponding bit in the Interrupt Enable Set (INTENSET) register, and disabled by writing a '1' to the corresponding bit in the Interrupt Enable Clear (INTENCLR) register.

An interrupt request is generated when the interrupt flag is set and the corresponding interrupt is enabled. The interrupt request remains active until the interrupt flag is cleared, the interrupt is disabled, or the WDT is reset. See the INTFLAG register description for details on how to clear interrupt flags.

The WDT has one common interrupt request line for all the interrupt sources. The user must read the INTFLAG register to determine which interrupt condition is present.

**Note:** Interrupts must be globally enabled for interrupt requests to be generated.

The Early Warning interrupt behaves differently in normal mode and in window mode. In normal mode, the Early Warning interrupt generation is defined by the Early Warning Offset in the Early Warning Control register (EWCTRL.EWOFFSET). The Early Warning Offset bits define the number of GCLK\_WDT clocks before the interrupt is generated, relative to the start of the watchdog time-out period. For example, if the WDT is operating in normal mode with CONFIG.PER = 0x2 and EWCTRL.EWOFFSET = 0x1, the Early Warning interrupt is generated 16 GCLK\_WDT clock cycles from the start of the watchdog time-out period, and the watchdog time-out system reset is generated 32 GCLK\_WDT clock cycles from the start of the watchdog time-out period. The user must take caution when programming the Early Warning Offset bits. If these bits define an Early Warning interrupt generation time greater than the watchdog time-out period, the watchdog time-out system reset is generated prior to the Early Warning interrupt. Thus, the Early Warning interrupt will never be generated.

In window mode, the Early Warning interrupt is generated at the start of the open window period. In a typical application where the system is in sleep mode, it can use this interrupt to wake up and clear the Watchdog Timer, after which the system can perform other tasks or return to sleep mode.

### 18.6.5. Synchronization

Due to asynchronicity between the main clock domain and the peripheral clock domains, some registers need to be synchronized when written or read.

When executing an operation that requires synchronization, the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY) will be set immediately, and cleared when synchronization is complete. The Synchronization Ready interrupt can be used to signal when synchronization is complete. This can be accessed via the Synchronization Ready Interrupt Flag in the Interrupt Flag Status and Clear register (INTFLAG.SYNCRDY).

If an operation that requires synchronization is executed while STATUS.SYNCBUSY='1', the bus will be stalled. All operations will complete successfully, but the CPU will be stalled and interrupts will be pending as long as the bus is stalled.

The following registers are synchronized when written:

- Control register (CTRL)
- Clear register (CLEAR)

Required write-synchronization is denoted by the "Write-Synchronized" property in the register description.

#### Related Links

[Register Synchronization](#) on page 101

## 18.7. Register Summary

Register summary

Offset	Name	Bit Pos.									
0x0	CTRL	7:0	ALWAYSON						WEN	ENABLE	
0x1	CONFIG	7:0		WINDOW[3:0]					PER[3:0]		
0x2	EWCTRL	7:0							EWOFFSET[3:0]		
0x3	Reserved										
0x4	INTENCLR	7:0								EW	
0x5	INTENSET	7:0								EW	
0x6	INTFLAG	7:0								EW	
0x7	STATUS	7:0	SYNCBUSY								
0x8	CLEAR	7:0					CLEAR[7:0]				

## 18.8. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16-, and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers require synchronization when read and/or written. Synchronization is denoted by the "Read-Synchronized" and/or "Write-Synchronized" property in each individual register description.

Some registers are enable-protected, meaning they can only be written when the module is disabled. Enable-protection is denoted by the "Enable-Protected" property in each individual register description.

Optional write-protection by the Peripheral Access Controller (PAC) is denoted by the "PAC Write-Protection" property in each individual register description.

### 18.8.1. Control

**Name:** CTRL

**Offset:** 0x0

**Reset:** N/A - Loaded from NVM User Row at start-up

**Property:** Write-Protected, Enable-Protected, Write-Synchronized

Bit	7	6	5	4	3	2	1	0
	ALWAYSON					WEN	ENABLE	
Access	R/W					R/W	R/W	
Reset	0					0	0	

#### Bit 7 – ALWAYSON: Always-On

This bit allows the WDT to run continuously. After being written to one, this bit cannot be written to zero, and the WDT will remain enabled until a power-on reset is received. When this bit is one, the Control register (CTRL), the Configuration register (CONFIG) and the Early Warning Control register (EWCTRL) will be read-only, and any writes to these registers are not allowed. Writing a zero to this bit has no effect.

This bit is not enable-protected.

These bits are loaded from NVM User Row at start-up. Refer to *NVM User Row Mapping* for more details.

Value	Description
0	The WDT is enabled and disabled through the ENABLE bit.
1	The WDT is enabled and can only be disabled by a power-on reset (POR).

#### Bit 2 – WEN: Watchdog Timer Window Mode Enable

The initial value of this bit is loaded from Flash Calibration.

This bit is loaded from NVM User Row at start-up. Refer to *NVM User Row Mapping* for more details.

Value	Description
0	Window mode is disabled (normal operation).
1	Window mode is enabled.

#### Bit 1 – ENABLE: Enable

This bit enables or disables the WDT. Can only be written while CTRL.ALWAYSON is zero.

Due to synchronization, there is delay from writing CTRL.ENABLE until the peripheral is enabled/disabled. The value written to CTRL.ENABLE will read back immediately, and the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY) will be set. STATUS.SYNCBUSY will be cleared when the operation is complete.

This bit is not enable-protected.

This bit is loaded from NVM User Row at start-up. Refer to *NVM User Row Mapping* for more details.

Value	Description
0	The WDT is disabled.
1	The WDT is enabled.

## 18.8.2. Configuration

**Name:** CONFIG

**Offset:** 0x1

**Reset:** N/A - Loaded from NVM User Row at startup

**Property:** Write-Protected, Enable-Protected, Write-Synchronized

Bit	7	6	5	4	3	2	1	0
	WINDOW[3:0]					PER[3:0]		
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 7:4 – WINDOW[3:0]: Window Mode Time-Out Period

In window mode, these bits determine the watchdog closed window period as a number of oscillator cycles.

These bits are loaded from NVM User Row at start-up. Refer to *NVM User Row Mapping* for more details.

Value	Description
0x0	8 clock cycles
0x1	16 clock cycles
0x2	32 clock cycles
0x3	64 clock cycles
0x4	128 clock cycles
0x5	256 clocks cycles
0x6	512 clocks cycles
0x7	1024 clock cycles
0x8	2048 clock cycles
0x9	4096 clock cycles
0xA	8192 clock cycles
0xB	16384 clock cycles
0xC-0xF	Reserved

### Bits 3:0 – PER[3:0]: Time-Out Period

These bits determine the watchdog time-out period as a number of GCLK\_WDT clock cycles. In window mode operation, these bits define the open window period.

These bits are loaded from NVM User Row at start-up. Refer to *NVM User Row Mapping* for more details.

Value	Description
0x0	8 clock cycles
0x1	16 clock cycles
0x2	32 clock cycles

Value	Description
0x3	64 clock cycles
0x4	128 clock cycles
0x5	256 clocks cycles
0x6	512 clocks cycles
0x7	1024 clock cycles
0x8	2048 clock cycles
0x9	4096 clock cycles
0xA	8192 clock cycles
0xB	16384 clock cycles
0xC-0xF	Reserved

### 18.8.3. Early Warning Interrupt Control

**Name:** EWCTRL

**Offset:** 0x2

**Reset:** N/A - Loaded from NVM User Row at start-up

**Property:** Write-Protected, Enable-Protected

Bit	7	6	5	4	3	2	1	0
	EWOFFSET[3:0]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

#### Bits 3:0 – EWOFFSET[3:0]: Early Warning Interrupt Time Offset

These bits determine the number of GCLK\_WDT clocks in the offset from the start of the watchdog time-out period to when the Early Warning interrupt is generated. These bits are loaded from NVM User Row at start-up. Refer to *NVM User Row Mapping* for more details.

Value	Description
0x0	8 clock cycles
0x1	16 clock cycles
0x2	32 clock cycles
0x3	64 clock cycles
0x4	128 clock cycles
0x5	256 clocks cycles
0x6	512 clocks cycles
0x7	1024 clock cycles
0x8	2048 clock cycles
0x9	4096 clock cycles
0xA	8192 clock cycles
0xB	16384 clock cycles
0xC-0xF	Reserved

#### 18.8.4. Interrupt Enable Clear

**Name:** INTENCLR  
**Offset:** 0x4  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
Access								EW
Reset								0

##### Bit 0 – EW: Early Warning Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit disables the Early Warning interrupt.

Value	Description
0	The Early Warning interrupt is disabled.
1	The Early Warning interrupt is enabled.

### 18.8.5. Interrupt Enable Set

**Name:** INTENSET  
**Offset:** 0x5  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0	
Access									EW
Reset									0

#### Bit 0 – EW: Early Warning Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit enables the Early Warning interrupt.

Value	Description
0	The Early Warning interrupt is disabled.
1	The Early Warning interrupt is enabled.

### 18.8.6. Interrupt Flag Status and Clear

**Name:** INTFLAG

**Offset:** 0x6

**Reset:** 0x00

**Property:** –

Bit	7	6	5	4	3	2	1	0	
Access									R/W
Reset									0

#### **Bit 0 – EW: Early Warning**

This flag is set when an Early Warning interrupt occurs, as defined by the EWOFFSET bit group in EWCTRL.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Early Warning interrupt flag.

### 18.8.7. Status

**Name:** STATUS

**Offset:** 0x7

**Reset:** 0x00

**Property:** –

Bit	7	6	5	4	3	2	1	0
	SYNCBUSY							
Access	R							
Reset	0							

#### **Bit 7 – SYNCBUSY: Synchronization Busy**

This bit is cleared when the synchronization of registers between clock domains is complete.

This bit is set when the synchronization of registers between clock domains is started.

### 18.8.8. Clear

**Name:** CLEAR

**Offset:** 0x8

**Reset:** 0x00

**Property:** Write-Protected, Write-Synchronized

Bit	7	6	5	4	3	2	1	0
CLEAR[7:0]								
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

#### Bits 7:0 – CLEAR[7:0]: Watchdog Clear

Writing 0xA5 to this register will clear the Watchdog Timer and the watchdog time-out period is restarted. Writing any other value will issue an immediate system reset.

## 19. RTC – Real-Time Counter

### 19.1. Overview

The Real-Time Counter (RTC) is a 32-bit counter with a 10-bit programmable prescaler that typically runs continuously to keep track of time. The RTC can wake up the device from sleep modes using the alarm/compare wake up, periodic wake up, or overflow wake up mechanisms.

The RTC is typically clocked by the 1.024kHz output from the 32.768kHz High-Accuracy Internal Crystal Oscillator(OSC32K) and this is the configuration optimized for the lowest power consumption. The faster 32.768kHz output can be selected if the RTC needs a resolution higher than 1ms. The RTC can also be clocked from other sources, selectable through the Generic Clock module (GCLK).

The RTC can generate periodic peripheral events from outputs of the prescaler, as well as alarm/compare interrupts and peripheral events, which can trigger at any counter value. Additionally, the timer can trigger an overflow interrupt and peripheral event, and can be reset on the occurrence of an alarm/compare match. This allows periodic interrupts and peripheral events at very long and accurate intervals.

The 10-bit programmable prescaler can scale down the clock source. By this, a wide range of resolutions and time-out periods can be configured. With a 32.768kHz clock source, the minimum counter tick interval is 30.5µs, and time-out periods can range up to 36 hours. For a counter tick interval of 1s, the maximum time-out period is more than 136 years.

### 19.2. Features

- 32-bit counter with 10-bit prescaler
- Multiple clock sources
- 32-bit or 16-bit Counter mode
  - One 32-bit or two 16-bit compare values
- Clock/Calendar mode
  - Time in seconds, minutes and hours (12/24)
  - Date in day of month, month and year
  - Leap year correction
- Digital prescaler correction/tuning for increased accuracy
- Overflow, alarm/compare match and prescaler interrupts and events
  - Optional clear on alarm/compare match

### 19.3. Block Diagram

Figure 19-1. RTC Block Diagram (Mode 0 — 32-Bit Counter)

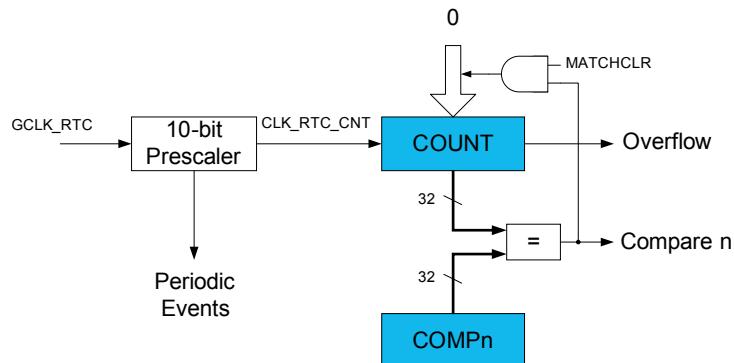

Figure 19-2. RTC Block Diagram (Mode 1 — 16-Bit Counter)

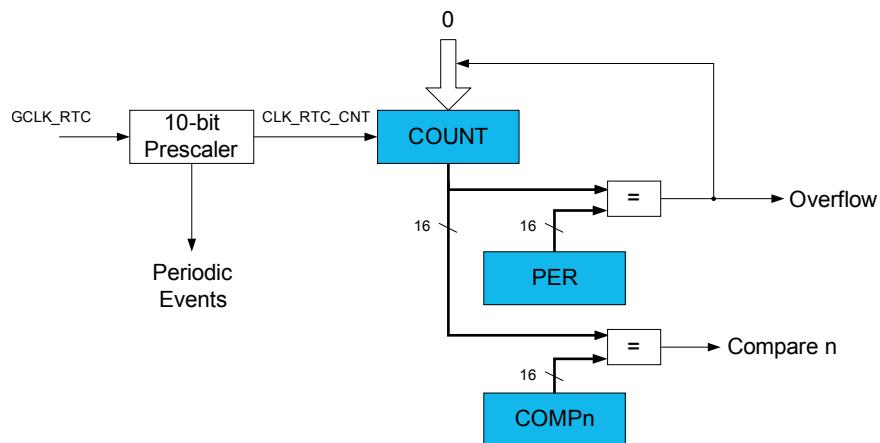

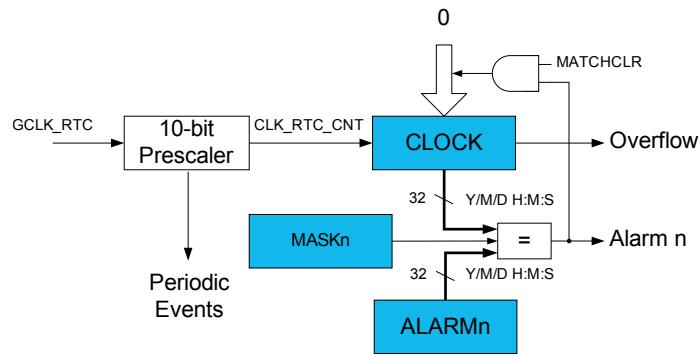

Figure 19-3. RTC Block Diagram (Mode 2 — Clock/Calendar)

### 19.4. Signal Description

Not applicable.

### 19.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly, as described below.

#### 19.5.1. I/O Lines

Not applicable.

### **19.5.2. Power Management**

The RTC will continue to operate in any sleep mode where the selected source clock is running. The RTC interrupts can be used to wake up the device from sleep modes. Events connected to the event system can trigger other operations in the system without exiting sleep modes. Refer to the *Power Manager* for details on the different sleep modes.

The RTC will be reset only at power-on (POR) or by setting the Software Reset bit in the Control register (CTRL.SWRST=1).

#### **Related Links**

[PM – Power Manager](#) on page 129

### **19.5.3. Clocks**

The RTC bus clock (CLK\_RTC\_APB) can be enabled and disabled in the Power Manager, and the default state of CLK\_RTC\_APB can be found in the Peripheral Clock Masking section.

A generic clock (GCLK\_RTC) is required to clock the RTC. This clock must be configured and enabled in the Generic Clock Controller before using the RTC. Refer to *GCLK – Generic Clock Controller* for details.

This generic clock is asynchronous to the user interface clock (CLK\_RTC\_APB). Due to this asynchronicity, accessing certain registers will require synchronization between the clock domains. Refer to [Synchronization](#) for further details.

The RTC should not work with the Generic Clock Generator 0.

#### **Related Links**

[GCLK - Generic Clock Controller](#) on page 108

### **19.5.4. DMA**

Not applicable.

### **19.5.5. Interrupts**

The interrupt request line is connected to the Interrupt Controller. Using the RTC interrupts requires the Interrupt Controller to be configured first. Refer to *Nested Vector Interrupt Controller* for details.

#### **Related Links**

[Nested Vector Interrupt Controller](#) on page 41

### **19.5.6. Events**

The events are connected to the *Event System*.

#### **Related Links**

[EVSYS – Event System](#) on page 349

### **19.5.7. Debug Operation**

When the CPU is halted in debug mode the RTC will halt normal operation. The RTC can be forced to continue operation during debugging. Refer to the Debug Control (DBGCTRL) register for details.

### **19.5.8. Register Access Protection**

Registers with write-access can be optionally write-protected by the Peripheral Access Controller (PAC), except the following:

- Interrupt Flag Status and Clear register (INTFLAG)
- Read Request register (READREQ)

- Status register (STATUS)
- Debug register (DBGCTRL)

**Note:** Optional write-protection is indicated by the "PAC Write-Protection" property in the register description.

When the CPU is halted in debug mode, all write-protection is automatically disabled. Write-protection does not apply for accesses through an external debugger.

- [Electrical Characteristics](#) on page 606

## 19.6. Functional Description

### 19.6.1. Principle of Operation

The RTC keeps track of time in the system and enables periodic events, as well as interrupts and events at a specified time. The RTC consists of a 10-bit prescaler that feeds a 32-bit counter. The actual format of the 32-bit counter depends on the RTC operating mode.

The RTC can function in one of these modes:

- Mode 0 - COUNT32: RTC serves as 32-bit counter
- Mode 1 - COUNT16: RTC serves as 16-bit counter
- Mode 2 - CLOCK: RTC serves as clock/calendar with alarm functionality

### 19.6.2. Basic Operation

#### 19.6.2.1. Initialization

The following bits are enable-protected, meaning that they can only be written when the RTC is disabled (CTRL.ENABLE=0):

- Operating Mode bits in the Control register (CTRL.MODE)
- Prescaler bits in the Control register (CTRL.PRESCALER)
- Clear on Match bit in the Control register (CTRL.MATCHCLR)
- Clock Representation bit in the Control register (CTRL.CLKREP)

The following register is enable-protected:

- Event Control register (EVCTRL)

Any writes to these bits or registers when the RTC is enabled or being enabled (CTRL.ENABLE=1) will be discarded. Writes to these bits or registers while the RTC is being disabled will be completed after the disabling is complete.

Enable-protection is denoted by the "Enable-Protected" property in the register description.

Before the RTC is enabled, it must be configured, as outlined by the following steps:

1. RTC operation mode must be selected by writing the Operating Mode bit group in the Control register (CTRL.MODE)
2. Clock representation must be selected by writing the Clock Representation bit in the Control register (CTRL.CLKREP)
3. Prescaler value must be selected by writing the Prescaler bit group in the Control register (CTRL.PRESCALER)

The RTC prescaler divides the source clock for the RTC counter.

**Note:** In Clock/Calendar mode, the prescaler must be configured to provide a 1Hz clock to the counter for correct operation.

The frequency of the RTC clock (CLK\_RTC\_CNT) is given by the following formula:

$$f_{\text{CLK\_RTC\_CNT}} = \frac{f_{\text{GCLK\_RTC}}}{2^{\text{PRESCALER}}}$$

The frequency of the generic clock, GCLK\_RTC, is given by  $f_{\text{GCLK\_RTC}}$ , and  $f_{\text{CLK\_RTC\_CNT}}$  is the frequency of the internal prescaled RTC clock, CLK\_RTC\_CNT.

#### Related Links

[EVCTRL](#) on page 254

[CTRL](#) on page 246

#### 19.6.2.2. Enabling, Disabling and Resetting

The RTC is enabled by setting the Enable bit in the Control register (CTRL.ENABLE=1). The RTC is disabled by writing CTRL.ENABLE=0.

The RTC is reset by setting the Software Reset bit in the Control register (CTRL.SWRST=1). All registers in the RTC, except DEBUG, will be reset to their initial state, and the RTC will be disabled. The RTC must be disabled before resetting it.

#### Related Links

[CTRL](#) on page 246

#### 19.6.3. Operating Modes

The RTC counter supports three RTC operating modes: 32-bit Counter, 16-bit Counter and Clock/Calendar. The operating mode is selected by writing to the Operating Mode bit group in the Control register (CTRL.MODE).

##### 19.6.3.1. 32-Bit Counter (Mode 0)

When the RTC Operating Mode bits in the Control register are zero (CTRL.MODE=00), the counter operates in 32-bit Counter mode. The block diagram of this mode is shown in [Figure 19-1](#). When the RTC is enabled, the counter will increment on every 0-to-1 transition of CLK\_RTC\_CNT. The counter will increment until it reaches the top value of 0xFFFFFFFF, and then wrap to 0x00000000. This sets the Overflow Interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG.OVF).

The RTC counter value can be read from or written to the Counter Value register (COUNT) in 32-bit format.

The counter value is continuously compared with the 32-bit Compare register (COMP). When a compare match occurs, the Compare interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG.CMP) is set on the next 0-to-1 transition of CLK\_RTC\_CNT.

If the Clear on Match bit in the Control register (CTRL.MATCHCLR) is '1', the counter is cleared on the next counter cycle when a compare match with COMP occurs. This allows the RTC to generate periodic interrupts or events with longer periods than are possible with the prescaler events. Note that when CTRL.MATCHCLR is '1', INTFLAG.CMP and INTFLAG.OVF will both be set simultaneously on a compare match with COMP.

#### 19.6.3.2. 16-Bit Counter (Mode 1)

When the RTC Operating Mode bits in the Control register (CTRL.MODE) are 1, the counter operates in 16-bit Counter mode as shown in [Figure 19-2](#). When the RTC is enabled, the counter will increment on every 0-to-1 transition of CLK\_RTC\_CNT. In 16-bit Counter mode, the 16-bit Period register (PER) holds the maximum value of the counter. The counter will increment until it reaches the PER value, and then wrap to 0x0000. This sets the Overflow interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG.OVF).

The RTC counter value can be read from or written to the Counter Value register (COUNT) in 16-bit format.

The counter value is continuously compared with the 16-bit Compare registers (COMP<sub>n</sub>, n=0–). When a compare match occurs, the Compare n interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG.CMP<sub>n</sub>, n=0–) is set on the next 0-to-1 transition of CLK\_RTC\_CNT.

#### 19.6.3.3. Clock/Calendar (Mode 2)

When CTRL.MODE is two, the counter operates in Clock/Calendar mode, as shown in [Figure 19-3](#). When the RTC is enabled, the counter will increment on every 0-to-1 transition of CLK\_RTC\_CNT. The selected clock source and RTC prescaler must be configured to provide a 1Hz clock to the counter for correct operation in this mode.

The time and date can be read from or written to the Clock Value register (CLOCK) in a 32-bit time/date format. Time is represented as:

- Seconds
- Minutes
- Hours

Hours can be represented in either 12- or 24-hour format, selected by the Clock Representation bit in the Control register (CTRL.CLKREP). This bit can be changed only while the RTC is disabled.

Date is represented as:

- Day as the numeric day of the month (starting at 1)
- Month as the numeric month of the year (1 = January, 2 = February, etc.)
- Year as a value counting the offset from a reference value that must be defined in software

The date is automatically adjusted for leap years, assuming every year divisible by 4 is a leap year. Therefore, the reference value must be a leap year, e.g. 2000. The RTC will increment until it reaches the top value of 23:59:59 December 31st of year 63, and then wrap to 00:00:00 January 1st of year 0. This will set the Overflow interrupt flag in the Interrupt Flag Status and Clear registers (INTFLAG.OVF).

The clock value is continuously compared with the 32-bit Alarm register (ALARM). When an alarm match occurs, the Alarm Interrupt flag in the Interrupt Flag Status and Clear registers (INTFLAG.ALARM<sub>n</sub>) is set on the next 0-to-1 transition of CLK\_RTC\_CNT. E.g. For a 1Hz clock counter, it means the Alarm 0

Interrupt flag is set with a delay of 1s after the occurrence of alarm match. A valid alarm match depends on the setting of the Alarm Mask Selection bits in the Alarm

A valid alarm match depends on the setting of the Alarm Mask Selection bits in the Alarm Mask register (MASK.SEL). These bits determine which time/date fields of the clock and alarm values are valid for comparison and which are ignored.

If the Clear on Match bit in the Control register (CTRL.MATCHCLR) is one, the counter is cleared on the next counter cycle when an alarm match with ALARM occurs. This allows the RTC to generate periodic interrupts or events with longer periods than are possible with the prescaler events (see [Periodic Events](#)). Note that when CTRL.MATCHCLR is '1', INTFLAG.ALARM0 and INTFLAG.OVF will both be set simultaneously on an alarm match with ALARM.

#### 19.6.4. DMA Operation

Not applicable.

#### 19.6.5. Interrupts

The RTC has the following interrupt sources which are asynchronous interrupts and can wake-up the device from any sleep mode.:

- Overflow (INTFLAG.OVF): Indicates that the counter has reached its top value and wrapped to zero.
- Compare n (INTFLAG.CMPn): Indicates a match between the counter value and the compare register.
- Alarm n (INTFLAG.ALARMn): Indicates a match between the clock value and the alarm register.
- Synchronization Ready (INTFLAG.SYNCRDY): Indicates an operation requires synchronization.

Each interrupt source has an interrupt flag associated with it. The interrupt flag in the Interrupt Flag Status and Clear (INTFLAG) register is set when the interrupt condition occurs. Each interrupt can be individually enabled by setting the corresponding bit in the Interrupt Enable Set register (INTENSET=1), and disabled by setting the corresponding bit in the Interrupt Enable Clear register (INTENCLR=1). An interrupt request is generated when the interrupt flag is raised and the corresponding interrupt is enabled. The interrupt request remains active until either the interrupt flag is cleared, the interrupt is disabled or the RTC is reset. See the description of the INTFLAG registers for details on how to clear interrupt flags. All interrupt requests from the peripheral are ORed together on system level to generate one combined interrupt request to the NVIC. Refer to the Nested Vector Interrupt Controller for details. The user must read the INTFLAG register to determine which interrupt condition is present.

**Note:** Interrupts must be globally enabled for interrupt requests to be generated. Refer to the Nested Vector Interrupt Controller for details.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

[Nested Vector Interrupt Controller](#) on page 41

#### 19.6.6. Events

The RTC can generate the following output events, which are generated in the same way as the corresponding interrupts:

- Overflow (OVF): Indicates that the counter has reached its top value and wrapped to zero.
- Period n (PERn): The corresponding bit in the prescaler has toggled. Refer to [Periodic Events](#) for details.
- Compare n (CMPn): Indicates a match between the counter value and the compare register.

- Alarm n (ALARMn): Indicates a match between the clock value and the alarm register.

Setting the Event Output bit in the Event Control Register (EVCTRL.xxxEO=1) enables the corresponding output event. Writing a zero to this bit disables the corresponding output event. Refer to the *EVSYS - Event System* for details on configuring the event system.

#### Related Links

[EVSYS – Event System](#) on page 349

#### 19.6.7. Sleep Mode Operation

The RTC will continue to operate in any sleep mode where the source clock is active. The RTC *interrupts* can be used to wake up the device from a sleep mode. RTC *events* can trigger other operations in the system without exiting the sleep mode.

An interrupt request will be generated after the wake-up if the Interrupt Controller is configured accordingly. Otherwise the CPU will wake up directly, without triggering any interrupt. In this case, the CPU will continue executing right from the first instruction that followed the entry into sleep.

The periodic events can also wake up the CPU through the interrupt function of the Event System. In this case, the event must be enabled and connected to an event channel with its interrupt enabled. See *Event System* for more information.

#### Related Links

[EVSYS – Event System](#) on page 349

#### 19.6.8. Synchronization

Due to asynchronicity between the main clock domain and the peripheral clock domains, some registers need to be synchronized when written or read.

When executing an operation that requires synchronization, the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY) will be set immediately, and cleared when synchronization is complete. The Synchronization Ready interrupt can be used to signal when synchronization is complete. This can be accessed via the Synchronization Ready Interrupt Flag in the Interrupt Flag Status and Clear register (INTFLAG.SYNCRDY). If an operation that requires synchronization is executed while STATUS.SYNCBUSY is one, the bus will be stalled. All operations will complete successfully, but the CPU will be stalled and interrupts will be pending as long as the bus is stalled.

The following bits are synchronized when written:

- Software Reset bit in the Control register (CTRL.SWRST)
- Enable bit in the Control register (CTRL.ENABLE)

The following registers are synchronized when written:

- Counter Value register (COUNT)
- Clock Value register (CLOCK)
- Counter Period register (PER)
- Compare n Value registers (COMPn)
- Alarm n Value registers (ALARMn)
- Frequency Correction register (FREQCORR)
- Alarm n Mask register (MASKn)

Required write-synchronization is denoted by the "Write-Synchronized" property in the register description.

The following registers are synchronized when read:

- The Counter Value register (COUNT)
- The Clock Value register (CLOCK)

Required read-synchronization is denoted by the "Read-Synchronized" property in the register description.

#### Related Links

[Register Synchronization](#) on page 101

### 19.6.9. Additional Features

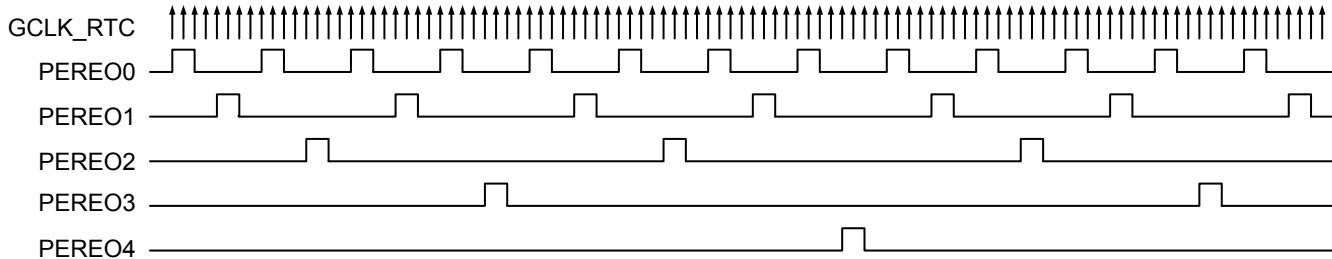

#### 19.6.9.1. Periodic Events

The RTC prescaler can generate events at periodic intervals, allowing flexible system tick creation. Any of the upper eight bits of the prescaler (bits 2 to 9) can be the source of an event. When one of the eight Periodic Event Output bits in the Event Control register (EVCTRL.PEREO[n=0..7]) is '1', an event is generated on the 0-to-1 transition of the related bit in the prescaler, resulting in a periodic event frequency of:

$$f_{PERIODIC} = \frac{f_{GCLK\_RTC}}{2^{n+3}}$$

$f_{GCLK\_RTC}$  is the frequency of the internal prescaler clock, GCLK\_RTC, and n is the position of the EVCTRL.PEREO[n] bit. For example, PER0 will generate an event every eight CLK\_RTC\_OSC cycles, PER1 every 16 cycles, etc. This is shown in the figure below. Periodic events are independent of the prescaler setting used by the RTC counter, except if CTRL.PRESCALER is zero. Then, no periodic events will be generated.

**Figure 19-4. Example Periodic Events**

#### 19.6.9.2. Frequency Correction

The RTC Frequency Correction module employs periodic counter corrections to compensate for a too-slow or too-fast oscillator. Frequency correction requires that CTRL.PRESCALER is greater than 1.

The digital correction circuit adds or subtracts cycles from the RTC prescaler to adjust the frequency in approximately 1ppm steps. Digital correction is achieved by adding or skipping a single count in the prescaler once every 1024 GCLK\_RTC cycles. The Value bit group in the Frequency Correction register (FREQCORR.VALUE) determines the number of times the adjustment is applied over 976 of these periods. The resulting correction is as follows:

$$\text{Correction in PPM} = \frac{\text{FREQCORR.VALUE}}{1024 \cdot 976} \cdot 10^6 \text{PPM}$$

This results in a resolution of 1.0006PPM.

The Sign bit in the Frequency Correction register (FREQCORR.SIGN) determines the direction of the correction. A positive value will speed up the frequency, and a negative value will slow down the frequency. Digital correction also affects the generation of the periodic events from the prescaler. When the correction is applied at the end of the correction cycle period, the interval between the previous periodic event and the next occurrence may also be shortened or lengthened depending on the correction value.

## 19.7. Register Summary

The register mapping depends on the Operating Mode bits in the Control register (CTRL.MODE). The register summary is presented for each of the three modes.

**Table 19-1. MODE0 - Mode Register Summary**

Offset	Name	Bit Pos.								
0x00	CTRL	7:0	MATCHCLR					MODE[1:0]	ENABLE	SWRST

## 19.8. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16-, and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Optional write-protection by the Peripheral Access Controller (PAC) is denoted by the "PAC Write-Protection" property in each individual register description.

Some registers require synchronization when read and/or written. Synchronization is denoted by the "Read-Synchronized" and/or "Write-Synchronized" property in each individual register description.

Some registers are enable-protected, meaning they can only be written when the module is disabled. Enable-protection is denoted by the "Enable-Protected" property in each individual register description.

### 19.8.1. Control - MODE0

**Name:** CTRL

**Offset:** 0x00

**Reset:** 0x0000

**Property:** Enable-Protected, Write-Protected, Write-Synchronized

Bit	15	14	13	12	11	10	9	8
	PRESCALER[3:0]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MATCHCLR				MODE[1:0]		ENABLE	SWRST
Access	R/W				R/W	R/W	R/W	W
Reset	0				0	0	0	0

#### Bits 11:8 – PRESCALER[3:0]: Prescaler

These bits define the prescaling factor for the RTC clock source (GCLK\_RTC) to generate the counter clock (CLK\_RTC\_CNT).

These bits are not synchronized.

PRESCALER[3:0]	Name	Description
0x0	DIV1	CLK_RTC_CNT = GCLK_RTC/1
0x1	DIV2	CLK_RTC_CNT = GCLK_RTC/2
0x2	DIV4	CLK_RTC_CNT = GCLK_RTC/4
0x3	DIV8	CLK_RTC_CNT = GCLK_RTC/8
0x4	DIV16	CLK_RTC_CNT = GCLK_RTC/16
0x5	DIV32	CLK_RTC_CNT = GCLK_RTC/32
0x6	DIV64	CLK_RTC_CNT = GCLK_RTC/64
0x7	DIV128	CLK_RTC_CNT = GCLK_RTC/128
0x8	DIV256	CLK_RTC_CNT = GCLK_RTC/256
0x9	DIV512	CLK_RTC_CNT = GCLK_RTC/512
0xA	DIV1024	CLK_RTC_CNT = GCLK_RTC/1024
0xB-0xF		Reserved

#### Bit 7 – MATCHCLR: Clear on Match

This bit is valid only in Mode 0 and Mode 2.

This bit is not synchronized.

Value	Description
0	The counter is not cleared on a Compare/Alarm 0 match.
1	The counter is cleared on a Compare/Alarm 0 match.

#### Bits 3:2 – MODE[1:0]: Operating Mode

These bits define the operating mode of the RTC.

These bits are not synchronized.

MODE[1:0]	Name	Description
0x0	COUNT32	Mode 0: 32-bit Counter
0x1	COUNT16	Mode 1: 16-bit Counter
0x2	CLOCK	Mode 2: Clock/Calendar
0x3		Reserved

#### Bit 1 – ENABLE: Enable

Due to synchronization, there is delay from writing CTRL.ENABLE until the peripheral is enabled/disabled. The value written to CTRL.ENABLE will read back immediately, and the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY) will be set. STATUS.SYNCBUSY will be cleared when the operation is complete.

This bit is not enable-protected.

Value	Description
0	The peripheral is disabled or being disabled.
1	The peripheral is enabled or being enabled.

#### Bit 0 – SWRST: Software Reset

Writing a zero to this bit has no effect.

Writing a one to this bit resets all registers in the RTC, except DBGCTRL, to their initial state, and the RTC will be disabled.

Writing a one to CTRL.SWRST will always take precedence, meaning that all other writes in the same write-operation will be discarded.

Due to synchronization, there is a delay from writing CTRL.SWRST until the reset is complete. CTRL.SWRST and STATUS.SYNCBUSY will both be cleared when the reset is complete.

This bit is not enable-protected.

Value	Description
0	There is no reset operation ongoing.
1	The reset operation is ongoing.

### 19.8.2. Control - MODE1

**Name:** CTRL

**Offset:** 0x00

**Reset:** 0x0000

**Property:** Enable-Protected, Write-Protected, Write-Synchronized

Bit	15	14	13	12	11	10	9	8
	PRESCALER[3:0]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MODE[1:0] ENABLE SWRST							
Access					R/W	R/W	R/W	W
Reset					0	0	0	0

#### Bits 11:8 – PRESCALER[3:0]: Prescaler

These bits define the prescaling factor for the RTC clock source (GCLK\_RTC) to generate the counter clock (CLK\_RTC\_CNT).

These bits are not synchronized.

PRESCALER[3:0]	Name	Description
0x0	DIV1	CLK_RTC_CNT = GCLK_RTC/1
0x1	DIV2	CLK_RTC_CNT = GCLK_RTC/2
0x2	DIV4	CLK_RTC_CNT = GCLK_RTC/4
0x3	DIV8	CLK_RTC_CNT = GCLK_RTC/8
0x4	DIV16	CLK_RTC_CNT = GCLK_RTC/16
0x5	DIV32	CLK_RTC_CNT = GCLK_RTC/32
0x6	DIV64	CLK_RTC_CNT = GCLK_RTC/64
0x7	DIV128	CLK_RTC_CNT = GCLK_RTC/128
0x8	DIV256	CLK_RTC_CNT = GCLK_RTC/256
0x9	DIV512	CLK_RTC_CNT = GCLK_RTC/512
0xA	DIV1024	CLK_RTC_CNT = GCLK_RTC/1024
0xB-0xF		Reserved

#### Bits 3:2 – MODE[1:0]: Operating Mode

These bits define the operating mode of the RTC.

These bits are not synchronized.

MODE[1:0]	Name	Description
0x0	COUNT32	Mode 0: 32-bit Counter
0x1	COUNT16	Mode 1: 16-bit Counter
0x2	CLOCK	Mode 2: Clock/Calendar
0x3		Reserved

#### Bit 1 – ENABLE: Enable

Due to synchronization, there is delay from writing CTRL.ENABLE until the peripheral is enabled/disabled. The value written to CTRL.ENABLE will read back immediately, and the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY) will be set. STATUS.SYNCBUSY will be cleared when the operation is complete.

This bit is not enable-protected.

Value	Description
0	The peripheral is disabled or being disabled.
1	The peripheral is enabled or being enabled.

#### Bit 0 – SWRST: Software Reset

Writing a zero to this bit has no effect.

Writing a one to this bit resets all registers in the RTC, except DBGCTRL, to their initial state, and the RTC will be disabled.

Writing a one to CTRL.SWRST will always take precedence, meaning that all other writes in the same write-operation will be discarded.

Due to synchronization, there is a delay from writing CTRL.SWRST until the reset is complete. CTRL.SWRST and STATUS.SYNCBUSY will both be cleared when the reset is complete.

This bit is not enable-protected.

Value	Description
0	There is no reset operation ongoing.
1	The reset operation is ongoing.

### 19.8.3. Control - MODE2

**Name:** CTRL

**Offset:** 0x00

**Reset:** 0x0000

**Property:** Enable-Protected, Write-Protected, Write-Synchronized

Bit	15	14	13	12	11	10	9	8
	PRESCALER[3:0]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MATCHCLR	CLKREP			MODE[1:0]		ENABLE	SWRST
Access	R/W	R/W			R/W	R/W	R/W	W
Reset	0	0			0	0	0	0

#### Bits 11:8 – PRESCALER[3:0]: Prescaler

These bits define the prescaling factor for the RTC clock source (GCLK\_RTC) to generate the counter clock (CLK\_RTC\_CNT).

These bits are not synchronized.

PRESCALER[3:0]	Name	Description
0x0	DIV1	CLK_RTC_CNT = GCLK_RTC/1
0x1	DIV2	CLK_RTC_CNT = GCLK_RTC/2
0x2	DIV4	CLK_RTC_CNT = GCLK_RTC/4
0x3	DIV8	CLK_RTC_CNT = GCLK_RTC/8
0x4	DIV16	CLK_RTC_CNT = GCLK_RTC/16
0x5	DIV32	CLK_RTC_CNT = GCLK_RTC/32
0x6	DIV64	CLK_RTC_CNT = GCLK_RTC/64
0x7	DIV128	CLK_RTC_CNT = GCLK_RTC/128
0x8	DIV256	CLK_RTC_CNT = GCLK_RTC/256
0x9	DIV512	CLK_RTC_CNT = GCLK_RTC/512
0xA	DIV1024	CLK_RTC_CNT = GCLK_RTC/1024
0xB-0xF		Reserved

#### Bit 7 – MATCHCLR: Clear on Match

This bit is valid only in Mode 0 and Mode 2. This bit can be written only when the peripheral is disabled.

This bit is not synchronized.

Value	Description
0	The counter is not cleared on a Compare/Alarm 0 match.
1	The counter is cleared on a Compare/Alarm 0 match.

#### Bit 6 – CLKREP: Clock Representation

This bit is valid only in Mode 2 and determines how the hours are represented in the Clock Value (CLOCK) register. This bit can be written only when the peripheral is disabled.

This bit is not synchronized.

Value	Description
0	24 Hour
1	12 Hour (AM/PM)

#### Bits 3:2 – MODE[1:0]: Operating Mode

These bits define the operating mode of the RTC.

These bits are not synchronized.

MODE[1:0]	Name	Description
0x0	COUNT32	Mode 0: 32-bit Counter
0x1	COUNT16	Mode 1: 16-bit Counter
0x2	CLOCK	Mode 2: Clock/Calendar
0x3		Reserved

#### Bit 1 – ENABLE: Enable

Due to synchronization, there is delay from writing CTRL.ENABLE until the peripheral is enabled/disabled. The value written to CTRL.ENABLE will read back immediately, and the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY) will be set. STATUS.SYNCBUSY will be cleared when the operation is complete.

This bit is not enable-protected.

Value	Description
0	The peripheral is disabled or being disabled.
1	The peripheral is enabled or being enabled.

#### Bit 0 – SWRST: Software Reset

Writing a zero to this bit has no effect.

Writing a one to this bit resets all registers in the RTC, except DBGCTRL, to their initial state, and the RTC will be disabled.

Writing a one to CTRL.SWRST will always take precedence, meaning that all other writes in the same write-operation will be discarded.

Due to synchronization, there is a delay from writing CTRL.SWRST until the reset is complete. CTRL.SWRST and STATUS.SYNCBUSY will both be cleared when the reset is complete.

This bit is not enable-protected.

Value	Description
0	There is no reset operation ongoing.
1	The reset operation is ongoing.

#### 19.8.4. Read Request

**Name:** READREQ

**Offset:** 0x02

**Reset:** 0x0010

**Property:** -

Bit	15	14	13	12	11	10	9	8
	RREQ	RCONT						
Access	W	R/W						
Reset	0	0						
Bit	7	6	5	4	3	2	1	0
						ADDR[5:0]		
Access			R	R	R	R	R	R
Reset			0	1	0	0	0	0

##### Bit 15 – RREQ: Read Request

Writing a zero to this bit has no effect.

Writing a one to this bit requests synchronization of the register pointed to by the Address bit group (READREQ.ADDR) and sets the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY).

##### Bit 14 – RCONT: Read Continuously

Writing a zero to this bit disables continuous synchronization.

Writing a one to this bit enables continuous synchronization of the register pointed to by READREQ.ADDR. The register value will be synchronized automatically every time the register is updated. READREQ.RCONT prevents READREQ.RREQ from clearing automatically.

This bit is cleared when the register pointed to by READREQ.ADDR is written.

##### Bits 5:0 – ADDR[5:0]: Address

These bits select the offset of the register that needs read synchronization. In the RTC only COUNT and CLOCK, which share the same address, are available for read synchronization. Therefore, ADDR is a read-only constant of 0x10.

### 19.8.5. Event Control - MODE0

**Name:** EVCTRL  
**Offset:** 0x04  
**Reset:** 0x0000  
**Property:** Enable-Protected, Write-Protected

Bit	15	14	13	12	11	10	9	8
	OVFEO							CMPEO0
Access	R/W							R/W
Reset	0							0
Bit	7	6	5	4	3	2	1	0
	PEREO7	PEREO6	PEREO5	PEREO4	PEREO3	PEREO2	PEREO1	PEREO0
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bit 15 – OVFEO: Overflow Event Output Enable

Value	Description
0	Overflow event is disabled and will not be generated.
1	Overflow event is enabled and will be generated for every overflow.

#### Bit 8 – CMPEO0: Compare 0 Event Output Enable

Value	Description
0	Compare 0 event is disabled and will not be generated.
1	Compare 0 event is enabled and will be generated for every compare match.

#### Bits 7,6,5,4,3,2,1,0 – PEREO<sub>x</sub> : Periodic Interval x Event Output Enable [x=7:0]

Value	Description
0	Periodic Interval x event is disabled and will not be generated.
1	Periodic Interval x event is enabled and will be generated.

### 19.8.6. Event Control - MODE1

**Name:** EVCTRL  
**Offset:** 0x04  
**Reset:** 0x0000  
**Property:** Enable-Protected, Write-Protected

Bit	15	14	13	12	11	10	9	8
	OVFEO						CMPEO1	CMPEO0
Access	R/W						R/W	R/W
Reset	0						0	0
Bit	7	6	5	4	3	2	1	0
	PEREO7	PEREO6	PEREO5	PEREO4	PEREO3	PEREO2	PEREO1	PEREO0
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bit 15 – OVFEO: Overflow Event Output Enable

Value	Description
0	Overflow event is disabled and will not be generated.
1	Overflow event is enabled and will be generated for every overflow.

#### Bits 9,8 – CMPEO<sub>x</sub> : Compare x Event Output Enable [x=1:0]

Value	Description
0	Compare x event is disabled and will not be generated.
1	Compare x event is enabled and will be generated for every compare match.

#### Bits 7,6,5,4,3,2,1,0 – PEREO<sub>x</sub> : Periodic Interval x Event Output Enable [x=7:0]

Value	Description
0	Periodic Interval x event is disabled and will not be generated.
1	Periodic Interval x event is enabled and will be generated.

### 19.8.7. Event Control - MODE2

**Name:** EVCTRL  
**Offset:** 0x04  
**Reset:** 0x0000  
**Property:** Enable-Protected, Write-Protected

Bit	15	14	13	12	11	10	9	8
	OVFEO							ALARMEO0
Access	R/W							R/W
Reset	0							0
Bit	7	6	5	4	3	2	1	0
	PEREO7	PEREO6	PEREO5	PEREO4	PEREO3	PEREO2	PEREO1	PEREO0
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bit 15 – OVFEO: Overflow Event Output Enable

Value	Description
0	Overflow event is disabled and will not be generated.
1	Overflow event is enabled and will be generated for every overflow.

#### Bit 8 – ALARMEO0: Alarm 0 Event Output Enable

Value	Description
0	Alarm 0 event is disabled and will not be generated.
1	Alarm 0 event is enabled and will be generated for every alarm.

#### Bits 7,6,5,4,3,2,1,0 – PEREOx : Periodic Interval x Event Output Enable [x=7:0]

Value	Description
0	Periodic Interval x event is disabled and will not be generated.
1	Periodic Interval x event is enabled and will be generated.

### 19.8.8. Interrupt Enable Clear - MODE0

**Name:** INTENCLR  
**Offset:** 0x06  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
	OVF	SYNCRDY						CMP0
Access	R/W	R/W						R/W
Reset	0	0						0

#### Bit 7 – OVF: Overflow Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Overflow Interrupt Enable bit and disable the corresponding interrupt.

Value	Description
0	The Overflow interrupt is disabled.
1	The Overflow interrupt is enabled, and an interrupt request will be generated when the Overflow interrupt flag is set.

#### Bit 6 – SYNCRDY: Synchronization Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Synchronization Ready Interrupt Enable bit and disable the corresponding interrupt.

Value	Description
0	The Synchronization Ready interrupt is disabled.
1	The Synchronization Ready interrupt is enabled, and an interrupt request will be generated when the Synchronization Ready interrupt flag is set.

#### Bit 0 – CMP0: Compare 0 Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Compare 0 Interrupt Enable bit and disable the corresponding interrupt.

Value	Description
0	The Compare 0 interrupt is disabled.
1	The Compare 0 interrupt is enabled, and an interrupt request will be generated when the Compare x interrupt flag is set.

### 19.8.9. Interrupt Enable Clear - MODE1

**Name:** INTENCLR  
**Offset:** 0x06  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
	OVF	SYNCRDY					CMP1	CMP0
Access	R/W	R/W					R/W	R/W
Reset	0	0					0	0

#### Bit 7 – OVF: Overflow Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Overflow Interrupt Enable bit and disable the corresponding interrupt.

Value	Description
0	The Overflow interrupt is disabled.
1	The Overflow interrupt is enabled, and an interrupt request will be generated when the Overflow interrupt flag is set.

#### Bit 6 – SYNCRDY: Synchronization Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Synchronization Ready Interrupt Enable bit and disable the corresponding interrupt.

Value	Description
0	The Synchronization Ready interrupt is disabled.
1	The Synchronization Ready interrupt is enabled, and an interrupt request will be generated when the Synchronization Ready interrupt flag is set.

#### Bits 1,0 – CMPx : Compare x Interrupt Enable [x=1:0]

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Compare x Interrupt Enable bit and disable the corresponding interrupt.

Value	Description
0	The Compare x interrupt is disabled.
1	The Compare x interrupt is enabled, and an interrupt request will be generated when the Compare x interrupt flag is set.

### 19.8.10. Interrupt Enable Clear - MODE2

**Name:** INTENCLR  
**Offset:** 0x06  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
	OVF	SYNCRDY						ALARM0
Access	R/W	R/W						R/W
Reset	0	0						0

#### Bit 7 – OVF: Overflow Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Overflow Interrupt Enable bit and disable the corresponding interrupt.

Value	Description
0	The Overflow interrupt is disabled.
1	The Overflow interrupt is enabled, and an interrupt request will be generated when the Overflow interrupt flag is set.

#### Bit 6 – SYNCRDY: Synchronization Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Synchronization Ready Interrupt Enable bit and disable the corresponding interrupt.

Value	Description
0	The synchronization ready interrupt is disabled.
1	The synchronization ready interrupt is enabled, and an interrupt request will be generated when the Synchronization Ready interrupt flag is set.

#### Bit 0 – ALARM0: Alarm 0 Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit disables the Alarm 0 interrupt.

Value	Description
0	The Alarm 0 interrupt is disabled.
1	The Alarm 0 interrupt is enabled, and an interrupt request will be generated when the Alarm 0 interrupt flag is set.

### 19.8.11. Interrupt Enable Set - MODE0

**Name:** INTENSET  
**Offset:** 0x07  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
	OVF	SYNCRDY						CMP0
Access	R/W	R/W						R/W
Reset	0	0						0

#### Bit 7 – OVF: Overflow Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the Overflow Interrupt Enable bit and enable the Overflow interrupt.

Value	Description
0	The overflow interrupt is disabled.
1	The overflow interrupt is enabled.

#### Bit 6 – SYNCRDY: Synchronization Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the Synchronization Ready Interrupt Enable bit and enable the Synchronization Ready interrupt.

Value	Description
0	The synchronization ready interrupt is disabled.
1	The synchronization ready interrupt is enabled.

#### Bit 0 – CMP0: Compare 0 Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the Compare 0 Interrupt Enable bit and enable the Compare 0 interrupt.

Value	Description
0	The compare 0 interrupt is disabled.
1	The compare 0 interrupt is enabled.

### 19.8.12. Interrupt Enable Set - MODE1

**Name:** INTENSET

**Offset:** 0x07

**Reset:** 0x00

**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
	OVF	SYNCRDY					CMP1	CMP0
Access	R/W	R/W					R/W	R/W
Reset	0	0					0	0

#### Bit 7 – OVF: Overflow Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the Overflow interrupt bit and enable the Overflow interrupt.

Value	Description
0	The overflow interrupt is disabled.
1	The overflow interrupt is enabled.

#### Bit 6 – SYNCRDY: Synchronization Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the Synchronization Ready Interrupt Enable bit and enable the Synchronization Ready interrupt.

Value	Description
0	The synchronization ready interrupt is disabled.
1	The synchronization ready interrupt is enabled.

#### Bits 1,0 – CMPx : Compare x Interrupt Enable [x=1:0]

Writing a zero to this bit has no effect.

Writing a one to this bit will set the Compare x Interrupt Enable bit and enable the Compare x interrupt.

Value	Description
0	The compare x interrupt is disabled.
1	The compare x interrupt is enabled.

### 19.8.13. Interrupt Enable Set - MODE2

**Name:** INTENSET

**Offset:** 0x07

**Reset:** 0x00

**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
	OVF	SYNCRDY						ALARM0
Access	R/W	R/W						R/W
Reset	0	0						0

#### Bit 7 – OVF: Overflow Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the Overflow Interrupt Enable bit and enable the Overflow interrupt.

Value	Description
0	The overflow interrupt is disabled.
1	The overflow interrupt is enabled.

#### Bit 6 – SYNCRDY: Synchronization Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the Synchronization Ready Interrupt bit and enable the Synchronization Ready interrupt.

Value	Description
0	The synchronization ready interrupt is disabled.
1	The synchronization ready interrupt is enabled.

#### Bit 0 – ALARM0: Alarm 0 Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the Alarm 0 Interrupt Enable bit and enable the Alarm 0 interrupt.

Value	Description
0	The alarm 0 interrupt is disabled.
1	The alarm 0 interrupt is enabled.

#### 19.8.14. Interrupt Flag Status and Clear - MODE0

**Name:** INTFLAG

**Offset:** 0x08

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0
	OVF	SYNCRDY						CMP0
Access	R/W	R/W						R/W
Reset	0	0						0

##### **Bit 7 – OVF: Overflow**

This flag is cleared by writing a one to the flag.

This flag is set on the next CLK\_RTC\_CNT cycle after an overflow condition occurs, and an interrupt request will be generated if INTENCLR/SET.OVF is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Overflow interrupt flag.

##### **Bit 6 – SYNCRDY: Synchronization Ready**

This flag is cleared by writing a one to the flag.

This flag is set on a 1-to-0 transition of the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY), except when caused by enable or software reset, and an interrupt request will be generated if INTENCLR/SET.SYNCRDY is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Synchronization Ready interrupt flag.

##### **Bit 0 – CMP0: Compare 0**

This flag is cleared by writing a one to the flag.

This flag is set on the next CLK\_RTC\_CNT cycle after a match with the compare condition, and an interrupt request will be generated if INTENCLR/SET.CMP0 is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Compare 0 interrupt flag.

### 19.8.15. Interrupt Flag Status and Clear - MODE1

**Name:** INTFLAG

**Offset:** 0x08

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0
	OVF	SYNCRDY					CMP1	CMP0
Access	R/W	R/W					R/W	R/W
Reset	0	0					0	0

#### Bit 7 – OVF: Overflow

This flag is cleared by writing a one to the flag.

This flag is set on the next CLK\_RTC\_CNT cycle after an overflow condition occurs, and an interrupt request will be generated if INTENCLR/SET.OVF is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Overflow interrupt flag.

#### Bit 6 – SYNCRDY: Synchronization Ready

This flag is cleared by writing a one to the flag.

This flag is set on a 1-to-0 transition of the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY), except when caused by enable or software reset, and an interrupt request will be generated if INTENCLR/SET.SYNCRDY is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Synchronization Ready interrupt flag.

#### Bits 1,0 – CMPx : Compare x [x=1:0]

This flag is cleared by writing a one to the flag.

This flag is set on the next CLK\_RTC\_CNT cycle after a match with the compare condition and an interrupt request will be generated if INTENCLR/SET.CMPx is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Compare x interrupt flag.

### 19.8.16. Interrupt Flag Status and Clear - MODE2

**Name:** INTFLAG

**Offset:** 0x08

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0
	OVF	SYNCRDY						ALARM0
Access	R/W	R/W						R/W
Reset	0	0						0

#### Bit 7 – OVF: Overflow

This flag is cleared by writing a one to the flag.

This flag is set on the next CLK\_RTC\_CNT cycle after an overflow condition occurs, and an interrupt request will be generated if INTENCLR/SET.OVF is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Overflow interrupt flag.

#### Bit 6 – SYNCRDY: Synchronization Ready

This flag is cleared by writing a one to the flag.

This flag is set on a 1-to-0 transition of the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY), except when caused by enable or software reset, and an interrupt request will be generated if INTENCLR/SET.SYNCRDY is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Synchronization Ready interrupt flag.

#### Bit 0 – ALARM0: Alarm 0

This flag is cleared by writing a one to the flag.

This flag is set on the next CLK\_RTC\_CNT cycle after a match with ALARM0 condition occurs, and an interrupt request will be generated if INTENCLR/SET.ALARM0 is also one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Alarm 0 interrupt flag.

### 19.8.17. Status

**Name:** STATUS

**Offset:** 0x0A

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0
	SYNCBUSY							
Access	R							
Reset	0							

#### **Bit 7 – SYNCBUSY: Synchronization Busy**

This bit is cleared when the synchronization of registers between the clock domains is complete.

This bit is set when the synchronization of registers between clock domains is started.

### 19.8.18. Debug Control

**Name:** DBGCTRL

**Offset:** 0x0B

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0	
Access									R/W
Reset									0

#### **Bit 0 – DBGRUN: Run During Debug**

This bit is not reset by a software reset.

Writing a zero to this bit causes the RTC to halt during debug mode.

Writing a one to this bit allows the RTC to continue normal operation during debug mode.

### 19.8.19. Frequency Correction

**Name:** FREQCORR

**Offset:** 0x0C

**Reset:** 0x00

**Property:** Write-Protected, Write-Synchronized

Bit	7	6	5	4	3	2	1	0	
	SIGN	VALUE[6:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	

#### Bit 7 – SIGN: Correction Sign

Value	Description
0	The correction value is positive, i.e., frequency will be increased.
1	The correction value is negative, i.e., frequency will be decreased.

#### Bits 6:0 – VALUE[6:0]: Correction Value

These bits define the amount of correction applied to the RTC prescaler.

1–127: The RTC frequency is adjusted according to the value.

Value	Description
0	Correction is disabled and the RTC frequency is unchanged.

### 19.8.20. Counter Value - MODE0

**Name:** COUNT

**Offset:** 0x10

**Reset:** 0x00000000

**Property:** Read-Synchronized, Write-Protected, Write-Synchronized

Bit	31	30	29	28	27	26	25	24
COUNT[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
COUNT[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
COUNT[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
COUNT[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – COUNT[31:0]: Counter Value

These bits define the value of the 32-bit RTC counter.

### 19.8.21. Counter Value - MODE1

**Name:** COUNT

**Offset:** 0x10

**Reset:** 0x0000

**Property:** Read-Synchronized, Write-Protected, Write-Synchronized

Bit	15	14	13	12	11	10	9	8
COUNT[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
COUNT[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – COUNT[15:0]: Counter Value

These bits define the value of the 16-bit RTC counter.

### 19.8.22. Clock Value - MODE2

**Name:** CLOCK

**Offset:** 0x10

**Reset:** 0x00000000

**Property:** Read-Synchronized, Write-Protected, Write-Synchronized

Bit	31	30	29	28	27	26	25	24
	YEAR[5:0]							MONTH[3:2]
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	MONTH[1:0]		DAY[4:0]					HOUR[4:4]
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	HOUR[3:0]				MINUTE[5:2]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MINUTE[1:0]		SECOND[5:0]					
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:26 – YEAR[5:0]: Year

The year offset with respect to the reference year (defined in software).

The year is considered a leap year if YEAR[1:0] is zero.

#### Bits 25:22 – MONTH[3:0]: Month

1 – January

2 – February

...

12 – December

#### Bits 21:17 – DAY[4:0]: Day

Day starts at 1 and ends at 28, 29, 30 or 31, depending on the month and year.

#### Bits 16:12 – HOUR[4:0]: Hour

When CTRL.CLKREP is zero, the Hour bit group is in 24-hour format, with values 0-23. When CTRL.CLKREP is one, HOUR[3:0] has values 1-12 and HOUR[4] represents AM (0) or PM (1).

**Table 19-4. Hour**

HOUR[4:0]	CLOCK.HOUR[4]	CLOCK.HOUR[3:0]	Description
0	0x00 - 0x17		Hour (0 - 23)
	0x18 - 0x1F		Reserved
1	0	0x0	Reserved
		0x1 - 0xC	AM Hour (1 - 12)
		0xD - 0xF	Reserved
	1	0x0	Reserved
		0x1 - 0xC	PM Hour (1 - 12)
		0xF - 0xF	Reserved

**Bits 11:6 – MINUTE[5:0]: Minute**

0 – 59.

**Bits 5:0 – SECOND[5:0]: Second**

0– 59.

### 19.8.23. Counter Period - MODE1

**Name:** PER

**Offset:** 0x14

**Reset:** 0x0000

**Property:** Write-Protected, Write-Synchronized

Bit	15	14	13	12	11	10	9	8
PER[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
PER[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – PER[15:0]: Counter Period

These bits define the value of the 16-bit RTC period.

#### 19.8.24. Compare n Value - MODE0

**Name:** COMP

**Offset:** 0x18

**Reset:** 0x00000000

**Property:** Write-Protected, Write-Synchronized

Bit	31	30	29	28	27	26	25	24
COMP[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
COMP[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
COMP[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
COMP[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – COMP[31:0]: Compare Value

The 32-bit value of COMPn is continuously compared with the 32-bit COUNT value. When a match occurs, the Compare n interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG.CMPn) is set on the next counter cycle, and the counter value is cleared if CTRL.MATCHCLR is one.

### 19.8.25. Compare n Value - MODE1

**Name:** COMPn  
**Offset:** 0x18+n\*0x2 [n=0..1]  
**Reset:** 0x0000  
**Property:** Write-Protected, Write-Synchronized

Bit	15	14	13	12	11	10	9	8
COMP[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	HOUR[3:0]				MINUTE[5:2]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MINUTE[1:0]		SECOND[5:0]					
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:26 – YEAR[5:0]: Year

The alarm year. Years are only matched if MASKn.SEL is 6.

#### Bits 25:22 – MONTH[3:0]: Month

The alarm month. Months are matched only if MASKn.SEL is greater than 4.

#### Bits 21:17 – DAY[4:0]: Day

The alarm day. Days are matched only if MASKn.SEL is greater than 3.

#### Bits 16:12 – HOUR[4:0]: Hour

The alarm hour. Hours are matched only if MASKn.SEL is greater than 2.

#### Bits 11:6 – MINUTE[5:0]: Minute

The alarm minute. Minutes are matched only if MASKn.SEL is greater than 1.

#### Bits 5:0 – SECOND[5:0]: Second

The alarm second. Seconds are matched only if MASKn.SEL is greater than 0.

### 19.8.27. Alarm n Mask - MODE2

**Name:** MASK

**Offset:** 0x1C

**Reset:** 0x00

**Property:** Write-Protected, Write-Synchronized

Bit	7	6	5	4	3	2	1	0
	SEL[2:0]							
Access						R/W	R/W	R/W
Reset						0	0	0

#### Bits 2:0 – SEL[2:0]: Alarm Mask Selection

These bits define which bit groups of Alarm n are valid.

SEL[2:0]	Name	Description
0x0	OFF	Alarm Disabled
0x1	SS	Match seconds only
0x2	MMSS	Match seconds and minutes only
0x3	HHMMSS	Match seconds, minutes, and hours only
0x4	DDHHMMSS	Match seconds, minutes, hours, and days only
0x5	MMDDHHMMSS	Match seconds, minutes, hours, days, and months only
0x6	YYMMDDHHMMSS	Match seconds, minutes, hours, days, months, and years
0x7		Reserved

## 20. EIC – External Interrupt Controller

### 20.1. Overview

The External Interrupt Controller (EIC) allows external pins to be configured as interrupt lines. Each interrupt line can be individually masked and can generate an interrupt on rising, falling, or both edges, or on high or low levels. Each external pin has a configurable filter to remove spikes. Each external pin can also be configured to be asynchronous in order to wake up the device from sleep modes where all clocks have been disabled. External pins can also generate an event.

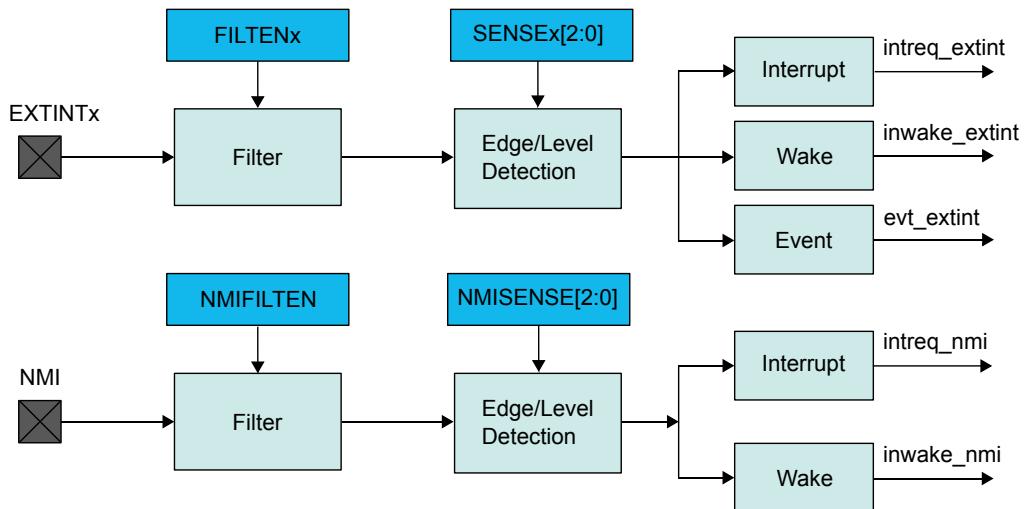

A separate non-maskable interrupt (NMI) is also supported. It has properties similar to the other external interrupts, but is connected to the NMI request of the CPU, enabling it to interrupt any other interrupt mode.

### 20.2. Features

- Up to external pins, plus one non-maskable pin
- Dedicated, individually maskable interrupt for each pin
- Interrupt on rising, falling, or both edges
- Interrupt on high or low levels
- Asynchronous interrupts for sleep modes without clock
- Filtering of external pins
- Event generation

### 20.3. Block Diagram

Figure 20-1. EIC Block Diagram

## 20.4. Signal Description

Signal Name	Type	Description
EXTINT[..0]	Digital Input	External interrupt pin
NMI	Digital Input	Non-maskable interrupt pin

One signal can be mapped on several pins.

### Related Links

[I/O Multiplexing and Considerations](#) on page 27

## 20.5. Product Dependencies

In order to use this EIC, other parts of the system must be configured correctly, as described below.

### 20.5.1. I/O Lines

Using the EIC's I/O lines requires the I/O pins to be configured.

#### Related Links

[PORT - I/O Pin Controller](#) on page 320

### 20.5.2. Power Management

All interrupts are available in all sleep modes, but the EIC can be configured to automatically mask some interrupts in order to prevent device wake-up.

The EIC will continue to operate in any sleep mode where the selected source clock is running. The EIC's interrupts can be used to wake up the device from sleep modes. Events connected to the Event System can trigger other operations in the system without exiting sleep modes.

#### Related Links

[PM – Power Manager](#) on page 129

[GCLK - Generic Clock Controller](#) on page 108

### 20.5.3. Clocks

The EIC bus clock (CLK\_EIC\_APB) can be enabled and disabled in the Power Manager, and the default state of CLK\_EIC\_APB can be found in the *Peripheral Clock Masking* section in PM – Power Manager.

A generic clock (GCLK\_EIC) is required to clock the peripheral. This clock must be configured and enabled in the Generic Clock Controller before using the peripheral. Refer to *GCLK – Generic Clock Controller*.

This generic clock is asynchronous to the user interface clock (CLK\_EIC\_APB). Due to this asynchronicity, writes to certain registers will require synchronization between the clock domains. Refer to [Synchronization](#) for further details.

#### Related Links

[Synchronization](#) on page 284

[GCLK - Generic Clock Controller](#) on page 108

### 20.5.4. Interrupts

There are two interrupt request lines, one for the external interrupts (EXTINT) and one for non-maskable interrupt (NMI).

The EXTINT interrupt request line is connected to the interrupt controller. Using the EIC interrupt requires the interrupt controller to be configured first.

The NMI interrupt request line is also connected to the interrupt controller, but does not require the interrupt to be configured.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

#### 20.5.5. Events

The events are connected to the Event System. Using the events requires the Event System to be configured first.

#### Related Links

[EVSYS – Event System](#) on page 349

#### 20.5.6. Debug Operation

When the CPU is halted in debug mode, the EIC continues normal operation. If the EIC is configured in a way that requires it to be periodically serviced by the CPU through interrupts or similar, improper operation or data loss may result during debugging.

#### 20.5.7. Register Access Protection

All registers with write-access can be write-protected optionally by the Peripheral Access Controller (PAC), except the following registers:

- Interrupt Flag Status and Clear register (INTFLAG)
- Non-Maskable Interrupt Flag Status and Clear register (NMIFLAG)

Optional write-protection by the Peripheral Access Controller (PAC) is denoted by the "PAC Write-Protection" property in each individual register description.

PAC write-protection does not apply to accesses through an external debugger.

#### Related Links

[PAC - Peripheral Access Controller](#) on page 45

#### 20.5.8. Analog Connections

Not applicable.

### 20.6. Functional Description

#### 20.6.1. Principle of Operation

The EIC detects edge or level condition to generate interrupts to the CPU interrupt controller or events to the Event System. Each external interrupt pin (EXTINT) can be filtered using majority vote filtering, clocked by GCLK\_EIC

#### 20.6.2. Basic Operation

##### 20.6.2.1. Initialization

The EIC must be initialized in the following order:

1. Enable CLK\_EIC\_APB
2. If edge detection or filtering is required, GCLK\_EIC must be enabled
3. Write the EIC configuration registers (EVCTRL, WAKEUP, CONFIGy)

#### 4. Enable the EIC

To use NMI, GCLK\_EIC must be enabled after EIC configuration (NMICTRL).

##### 20.6.2.2. Enabling, Disabling and Resetting

The EIC is enabled by writing a '1' to the Enable bit in the Control register (CTRL.ENABLE). The EIC is disabled by writing CTRL.ENABLE to '0'.

The EIC is reset by setting the Software Reset bit in the Control register (CTRL.SWRST). All registers in the EIC will be reset to their initial state, and the EIC will be disabled.

Refer to the CTRL register description for details.

##### 20.6.3. External Pin Processing

Each external pin can be configured to generate an interrupt/event on edge detection (rising, falling or both edges) or level detection (high or low). The sense of external interrupt pins is configured by writing the Input Sense x bits in the Config n register (CONFIGn.SENSEx). The corresponding interrupt flag (INTFLAG.EXTINT[x]) in the Interrupt Flag Status and Clear register (INTFLAG) is set when the interrupt condition is met.

When the interrupt flag has been cleared in edge-sensitive mode, INTFLAG.EXTINT[x] will only be set if a new interrupt condition is met. In level-sensitive mode, when interrupt has been cleared, INTFLAG.EXTINT[x] will be set immediately if the EXTINTx pin still matches the interrupt condition.

Each external pin can be filtered by a majority vote filtering, clocked by GCLK\_EIC. Filtering is enabled if bit Filter Enable x in the Configuration n register (CONFIGn.FILTENx) is written to '1'. The majority vote filter samples the external pin three times with GCLK\_EIC and outputs the value when two or more samples are equal.

**Table 20-1. Majority Vote Filter**

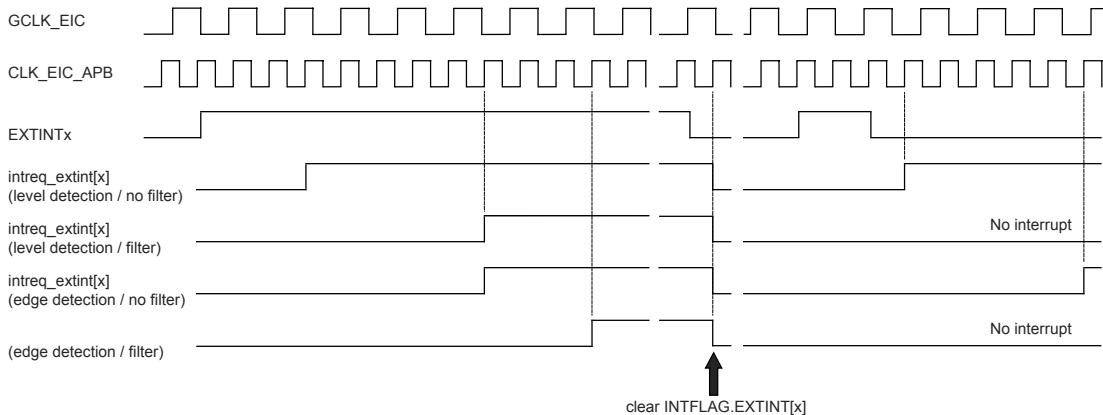

Samples [0, 1, 2]	Filter Output
[0,0,0]	0
[0,0,1]	0
[0,1,0]	0
[0,1,1]	1
[1,0,0]	0
[1,0,1]	1
[1,1,0]	1
[1,1,1]	1

When an external interrupt is configured for level detection, or if filtering is disabled, detection is made asynchronously, and GCLK\_EIC is not required.

If filtering or edge detection is enabled, the EIC automatically requests the GCLK\_EIC to operate (GCLK\_EIC must be enabled in the GCLK module, see *GCLK – Generic Clock Controller* for details). If level detection is enabled, GCLK\_EIC is not required, but interrupt and events can still be generated.

When an external interrupt is configured for level detection and when filtering is disabled, detection is done asynchronously. Asynchronous detection does not require GCLK\_EIC, but interrupt and events can still be generated. If filtering or edge detection is enabled, the EIC automatically requests GCLK\_EIC to operate. GCLK\_EIC must be enabled in the GCLK module.

**Figure 20-2. Interrupt Detections**

The detection delay depends on the detection mode.

**Table 20-2. Interrupt Latency**

Detection mode	Latency (worst case)
Level without filter	Three CLK_EIC_APB periods
Level with filter	Four GCLK_EIC periods + Three CLK_EIC_APB periods
Edge without filter	Four GCLK_EIC periods + Three CLK_EIC_APB periods
Edge with filter	Six GCLK_EIC periods + Three CLK_EIC_APB periods

### Related Links

[GCLK - Generic Clock Controller](#) on page 108

## 20.6.4. Additional Features

### 20.6.4.1. Non-Maskable Interrupt (NMI)

The non-maskable interrupt pin can also generate an interrupt on edge or level detection, but it is configured with the dedicated NMI Control register (NMICTRL). To select the sense for NMI, write to the NMISENSE bit group in the NMI Control register (NMICTRL.NMISENSE). NMI filtering is enabled by writing a '1' to the NMI Filter Enable bit (NMICTRL.NMIFILTEN).

If edge detection or filtering is required, enable GCLK\_EIC or CLK\_ULP32K.

NMI detection is enabled only by the NMICTRL.NMISENSE value, and the EIC is not required to be enabled.

When an NMI is detected, the non-maskable interrupt flag in the NMI Flag Status and Clear register is set (NMIFLAG.NMI). NMI interrupt generation is always enabled, and NMIFLAG.NMI generates an interrupt request when set.

## 20.6.5. Interrupts

The EIC has the following interrupt sources:

- External interrupt pins (EXTINTx). See [Basic Operation](#).
- Non-maskable interrupt pin (NMI). See [Additional Features](#).

Each interrupt source has an associated interrupt flag. The interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG) is set when an interrupt condition occurs (NMIFLAG for NMI). Each interrupt,

except NMI, can be individually enabled by setting the corresponding bit in the Interrupt Enable Set register (INTENSET=1), and disabled by setting the corresponding bit in the Interrupt Enable Clear register (INTENCLR=1).

An interrupt request is generated when the interrupt flag is set and the corresponding interrupt is enabled. The interrupt request remains active until the interrupt flag is cleared, the interrupt is disabled, or the EIC is reset. See the INTFLAG register for details on how to clear interrupt flags. The EIC has one common interrupt request line for all the interrupt sources, and one interrupt request line for the NMI. The user must read the INTFLAG (or NMIFLAG) register to determine which interrupt condition is present.

**Note:** Interrupts must be globally enabled for interrupt requests to be generated.

**Note:** If an external interrupts (EXTINT) is common on two or more I/O pins, only one will be active (the first one programmed).

#### Related Links

[Processor And Architecture](#) on page 40

#### 20.6.6. Events

The EIC can generate the following output events:

- External event from pin (EXTINTx).

Setting an Event Output Control register (EVCTRL.EXTINTEO) enables the corresponding output event. Clearing this bit disables the corresponding output event. Refer to *Event System* for details on configuring the Event System.

When the condition on pin EXTINTx matches the configuration in the CONFIGn register, the corresponding event is generated, if enabled.

#### Related Links

[EVSYS – Event System](#) on page 349

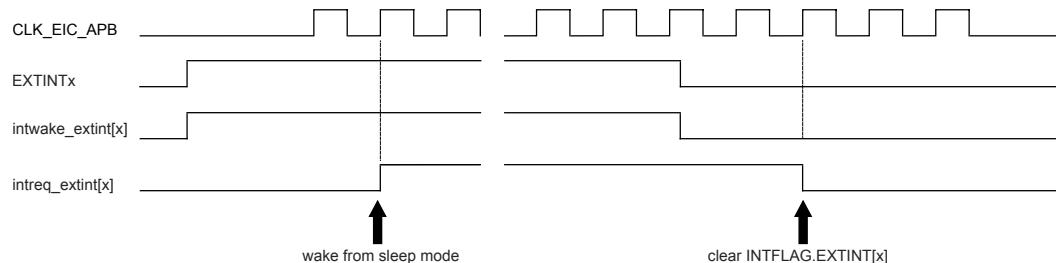

#### 20.6.7. Sleep Mode Operation

In sleep modes, an EXTINTx pin can wake up the device if the corresponding condition matches the configuration in CONFIGy register. Writing a one to a Wake-Up Enable bit (WAKEUP.WAKEUPEN[x]) enables the wake-up from pin EXTINTx. Writing a zero to a Wake-Up Enable bit (WAKEUP.WAKEUPEN[x]) disables the wake-up from pin EXTINTx.

Using WAKEUPEN[x]=1 with INTENSET=0 is not recommended.

In sleep modes, an EXTINTx pin can wake up the device if the corresponding condition matches the configuration in CONFIGn register, and the corresponding bit in the Interrupt Enable Set register (INTENSET) is written to '1'. WAKEUP.WAKEUPEN[x]=1 can enable the wake-up from pin EXTINTx.

**Figure 20-3. Wake-Up Operation Example (High-Level Detection, No Filter, WAKEUPEN[x]=1)**

## 20.6.8. Synchronization

Due to asynchronicity between the main clock domain and the peripheral clock domains, some registers need to be synchronized when written or read.

When executing an operation that requires synchronization, the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY) will be set immediately, and cleared when synchronization is complete.

If an operation that requires synchronization is executed while STATUS.SYNCBUSY is one, the bus will be stalled. All operations will complete successfully, but the CPU will be stalled, and interrupts will be pending as long as the bus is stalled.

The following bits are synchronized when written:

- Software Reset bit in the Control register (CTRL.SWRST)
- Enable bit in the Control register (CTRL.ENABLE)

### Related Links

[Register Synchronization](#) on page 101

## 20.8. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16-, and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers require synchronization when read and/or written. Synchronization is denoted by the "Read-Synchronized" and/or "Write-Synchronized" property in each individual register description.

Some registers are enable-protected, meaning they can only be written when the module is disabled. Enable-protection is denoted by the "Enable-Protected" property in each individual register description.

## 20.8.1. Control

**Name:** CTRL  
**Offset:** 0x00  
**Reset:** 0x00  
**Property:** Write-Protected, Write-Synchronized

Bit	7	6	5	4	3	2	1	0
Access							ENABLE	SWRST
Reset							0	0
							R/W	R/W

### Bit 1 – ENABLE: Enable

Due to synchronization, there is delay from writing CTRL.ENABLE until the peripheral is enabled/disabled. The value written to CTRL.ENABLE will read back immediately, and the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY) will be set. STATUS.SYNCBUSY will be cleared when the operation is complete.

Value	Description
0	The EIC is disabled.
1	The EIC is enabled.

### Bit 0 – SWRST: Software Reset

Writing a zero to this bit has no effect.

Writing a one to this bit resets all registers in the EIC to their initial state, and the EIC will be disabled.

Writing a one to CTRL.SWRST will always take precedence, meaning that all other writes in the same write operation will be discarded.

Due to synchronization, there is a delay from writing CTRL.SWRST until the reset is complete. CTRL.SWRST and STATUS.SYNCBUSY will both be cleared when the reset is complete.

Value	Description
0	There is no ongoing reset operation.
1	The reset operation is ongoing.

## 20.8.2. Status

**Name:** STATUS

**Offset:** 0x01

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0
	SYNCBUSY							
Access	R							
Reset	0							

### Bit 7 – SYNCBUSY: Synchronization Busy

This bit is cleared when the synchronization of registers between the clock domains is complete.

This bit is set when the synchronization of registers between clock domains is started.

### 20.8.3. Non-Maskable Interrupt Control

**Name:** NMICTRL  
**Offset:** 0x02  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
					NMIFILTEN		NMISENSE[2:0]	
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

#### Bit 3 – NMIFILTEN: Non-Maskable Interrupt Filter Enable

Value	Description
0	NMI filter is disabled.
1	NMI filter is enabled.

#### Bits 2:0 – NMISENSE[2:0]: Non-Maskable Interrupt Sense

These bits define on which edge or level the NMI triggers.

NMISENSE[2:0]	Name	Description
0x0	NONE	No detection
0x1	RISE	Rising-edge detection
0x2	FALL	Falling-edge detection
0x3	BOTH	Both-edges detection
0x4	HIGH	High-level detection
0x5	LOW	Low-level detection
0x6-0x7		Reserved

#### 20.8.4. Non-Maskable Interrupt Flag Status and Clear

**Name:** NMIFLAG

**Offset:** 0x03

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0	
Access									NMI
Reset									R/W 0

##### **Bit 0 – NMI: Non-Maskable Interrupt**

This flag is cleared by writing a one to it.

This flag is set when the NMI pin matches the NMI sense configuration, and will generate an interrupt request.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the non-maskable interrupt flag.

## 20.8.5. Event Control

**Name:** EVCTRL  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Write-Protected

Bit	31	30	29	28	27	26	25	24
	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	EXTINTEO15	EXTINTEO14	EXTINTEO13	EXTINTEO12	EXTINTEO11	EXTINTEO10	EXTINTEO9	EXTINTEO8
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	EXTINTEO7	EXTINTEO6	EXTINTEO5	EXTINTEO4	EXTINTEO3	EXTINTEO2	EXTINTEO1	EXTINTEO0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – EXTINTEOn: External Interrupt x Event Output Enable [x=15..0]

These bits indicate whether the event associated with the EXTINTx pin is enabled or not to generated for every detection.

Value	Description
0	Event from pin EXTINTx is disabled.
1	Event from pin EXTINTx is enabled.

## 20.8.6. Interrupt Enable Clear

**Name:** INTENCLR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Write-Protected

Bit	31	30	29	28	27	26	25	24
	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]
Access

Bit	7	6	5	4	3	2	1	0
	EXTINT7	EXTINT6	EXTINT5	EXTINT4	EXTINT3	EXTINT2	EXTINT1	EXTINT0
Access	R/W							
Reset	0	0	0	0	0	0	0	0

### Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – EXTINTn: External Interrupt x [x=15..0]

This flag is cleared by writing a one to it.

This flag is set when EXTINTx pin matches the external interrupt sense configuration and will generate an interrupt request if INTENCLR/SET.EXTINT[x] is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the External Interrupt x flag.

## 20.8.9. Wake-Up Enable

**Name:** WAKEUP  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Write-Protected

Bit	31	30	29	28	27	26	25	24

Bit	7	6	5	4	3	2	1	0
Access	R/W							
Reset	0	0	0	0	0	0	0	0

### Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – WAKEUPEn: External Interrupt x Wake-up Enable [x=15..0]

This bit enables or disables wake-up from sleep modes when the EXTINTx pin matches the external interrupt sense configuration.

Value	Description
0	Wake-up from the EXTINTx pin is disabled.
1	Wake-up from the EXTINTx pin is enabled.

### 20.8.10. Configuration n

**Name:** CONFIGn  
**Offset:** 0x18 + n\*0x04 [n=0..2]  
**Reset:** 0x00000000  
**Property:** Write-Protected

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	FILTEN1	SENSE1[2:0]			FILTEN0	SENSE0[2:0]		
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 31, 27, 23, 19, 15, 11, 7, 3 – FILTENx: Filter 0 Enable [x=7..0]

0:	Filter is disabled for EXTINT[n*8+x] input.
1:	Filter is enabled for EXTINT[n*8+x] input.

#### Bits 30:28, 26:24, 22:20, 18:16, 14:12, 10:8, 6:4, 2:0 – SENSe0: Input Sense 0 Configuration [x=7..0]

SENSe0[2:0]	Name	Description
0x0	NONE	No detection
0x1	RISE	Rising-edge detection
0x2	FALL	Falling-edge detection
0x3	BOTH	Both-edges detection
0x4	HIGH	High-level detection
0x5	LOW	Low-level detection
0x6-0x7		Reserved

## 21. NVMCTRL – Non-Volatile Memory Controller

### 21.1. Overview

Non-Volatile Memory (NVM) is a reprogrammable Flash memory that retains program and data storage even with power off. The NVM Controller (NVMCTRL) connects to the AHB and APB bus interfaces for system access to the NVM block. The AHB interface is used for reads and writes to the NVM block, while the APB interface is used for commands and configuration.

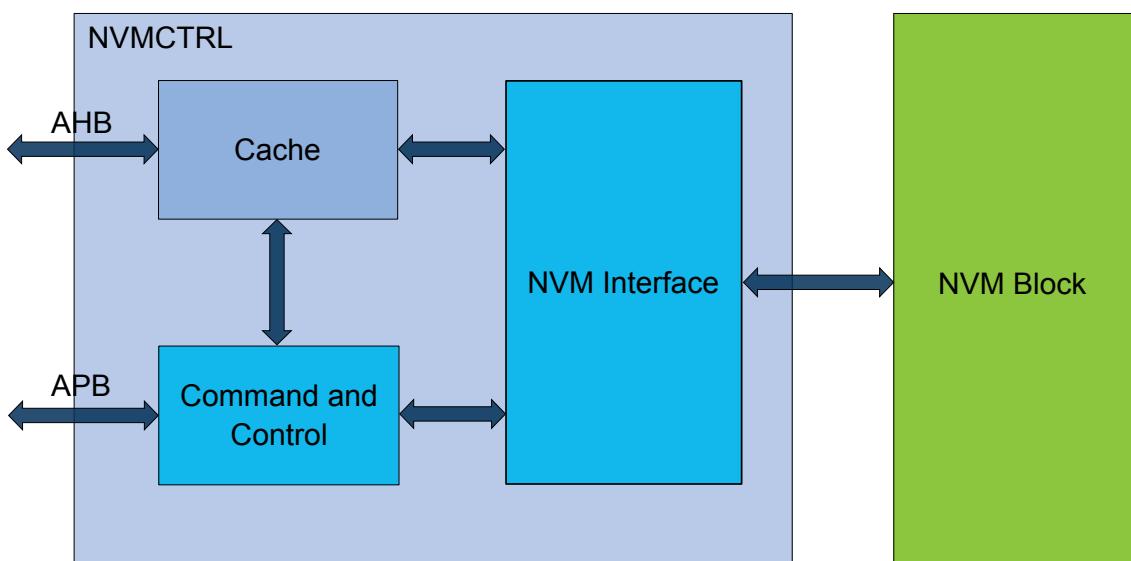

### 21.2. Features

- 32-bit AHB interface for reads and writes
- All NVM sections are memory mapped to the AHB, including calibration and system configuration
- 32-bit APB interface for commands and control
- Programmable wait states for read optimization
- 16 regions can be individually protected or unprotected
- Additional protection for boot loader
- Supports device protection through a security bit
- Interface to Power Manager for power-down of Flash blocks in sleep modes
- Can optionally wake up on exit from sleep or on first access
- Direct-mapped cache

**Note:** A register with property "Enable-Protected" may contain bits that are *not* enable-protected.

### 21.3. Block Diagram

Figure 21-1. Block Diagram

### 21.4. Signal Description

Not applicable.

## 21.5. Product Dependencies

In order to use this module, other parts of the system must be configured correctly, as described below.

### 21.5.1. Power Management

The NVMCTRL will continue to operate in any sleep mode where the selected source clock is running. The NVMCTRL interrupts can be used to wake up the device from sleep modes.

The Power Manager will automatically put the NVM block into a low-power state when entering sleep mode. This is based on the Control B register (CTRLB) SLEEP prm bit setting. Refer to the [CTRLB.SLEEP prm](#) register description for more details.

#### Related Links

[PM – Power Manager](#) on page 129

### 21.5.2. Clocks

Two synchronous clocks are used by the NVMCTRL. One is provided by the AHB bus (CLK\_NVMCTRL\_AHB) and the other is provided by the APB bus (CLK\_NVMCTRL\_APB). For higher system frequencies, a programmable number of wait states can be used to optimize performance. When changing the AHB bus frequency, the user must ensure that the NVM Controller is configured with the proper number of wait states. Refer to the Electrical Characteristics for the exact number of wait states to be used for a particular frequency range.

#### Related Links

[Electrical Characteristics](#) on page 606

### 21.5.3. Interrupts

The NVM Controller interrupt request line is connected to the interrupt controller. Using the NVMCTRL interrupt requires the interrupt controller to be programmed first.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 21.5.4. Debug Operation

When an external debugger forces the CPU into debug mode, the peripheral continues normal operation.

Access to the NVM block can be protected by the security bit. In this case, the NVM block will not be accessible. See the section on the NVMCTRL [Security Bit](#) for details.

### 21.5.5. Register Access Protection

All registers with write-access are optionally write-protected by the Peripheral Access Controller (PAC), except the following registers:

- Interrupt Flag Status and Clear register (INTFLAG)
- Status register (STATUS)

Optional write-protection by the Peripheral Access Controller (PAC) is denoted by the "PAC Write-Protection" property in each individual register description.

#### Related Links

[PAC - Peripheral Access Controller](#) on page 45

### 21.5.6. Analog Connections

Not applicable.

## 21.6. Functional Description

### 21.6.1. Principle of Operation

The NVM Controller is a slave on the AHB and APB buses. It responds to commands, read requests and write requests, based on user configuration.

#### 21.6.1.1. Initialization

After power up, the NVM Controller goes through a power-up sequence. During this time, access to the NVM Controller from the AHB bus is halted. Upon power-up completion, the NVM Controller is operational without any need for user configuration.

### 21.6.2. Memory Organization

Refer to the Physical Memory Map for memory sizes and addresses for each device.

The NVM is organized into rows, where each row contains four pages, as shown in the NVM Row Organization figure. The NVM has a row-erase granularity, while the write granularity is by page. In other words, a single row erase will erase all four pages in the row, while four write operations are used to write the complete row.

**Figure 21-2. NVM Row Organization**

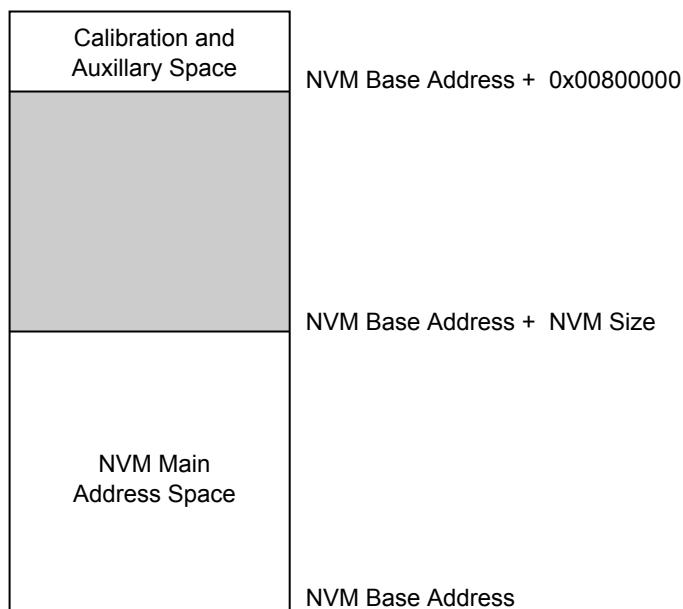

Row n	Page (n*4) + 3	Page (n*4) + 2	Page (n*4) + 1	Page (n*4) + 0
-------	----------------	----------------	----------------	----------------

The NVM block contains a calibration and auxiliary space plus a dedicated EEPROM emulation space that are memory mapped. Refer to the NVM Organization figure below for details.

The calibration and auxiliary space contains factory calibration and system configuration information. These spaces can be read from the AHB bus in the same way as the main NVM main address space.

In addition, a boot loader section can be allocated at the beginning of the main array, and an EEPROM section can be allocated at the end of the NVM main address space.

**Figure 21-3. NVM Memory Organization**

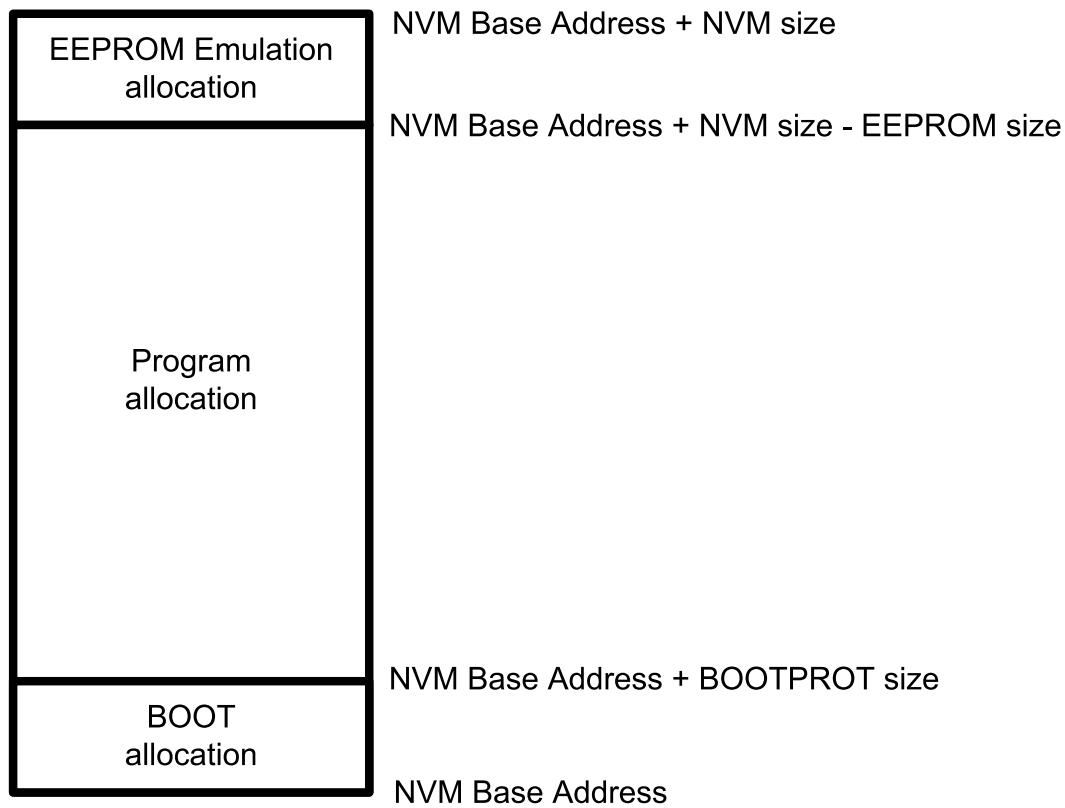

The lower rows in the NVM main address space can be allocated as a boot loader section by using the BOOTPROT fuses, and the upper rows can be allocated to EEPROM, as shown in the figure below.

The boot loader section is protected by the lock bit(s) corresponding to this address space and by the BOOTPROT[2:0] fuse. The EEPROM rows can be written regardless of the region lock status.

The number of rows protected by BOOTPROT is given in [Boot Loader Size](#), the number of rows allocated to the EEPROM are given in [EEPROM Size](#).

Figure 21-4. EEPROM and Boot Loader Allocation

### 21.6.3. Region Lock Bits

The NVM block is grouped into 16 equally sized regions. The region size is dependent on the Flash memory size, and is given in the table below. Each region has a dedicated lock bit preventing writing and erasing pages in the region. After production, all regions will be unlocked.

Table 21-1. Region Size

Memory Size [KB]	Region Size [KB]
256	16
128	8
64	4
32	2

To lock or unlock a region, the Lock Region and Unlock Region commands are provided. Writing one of these commands will temporarily lock/unlock the region containing the address loaded in the ADDR register. ADDR can be written by software, or the automatically loaded value from a write operation can be used. The new setting will stay in effect until the next Reset, or until the setting is changed again using the Lock and Unlock commands. The current status of the lock can be determined by reading the LOCK register.

To change the default lock/unlock setting for a region, the user configuration section of the auxiliary space must be written using the Write Auxiliary Page command. Writing to the auxiliary space will take effect after the next Reset. Therefore, a boot of the device is needed for changes in the lock/unlock setting to take effect. Refer to the Physical Memory Map for calibration and auxiliary space address mapping.

## Related Links

[Physical Memory Map](#) on page 36

### 21.6.4. Command and Data Interface

The NVM Controller is addressable from the APB bus, while the NVM main address space is addressable from the AHB bus. Read and automatic page write operations are performed by addressing the NVM main address space or the RWWEE address space directly, while other operations such as manual page writes and row erases must be performed by issuing commands through the NVM Controller.

When performing a write operation the flash will be stalled during the whole operation. If running code from the flash, the next instruction will not be executed until after the operation has completed.

To issue a command, the CTRLA.CMD bits must be written along with the CTRLA.CMDEX value. When a command is issued, INTFLAG.READY will be cleared until the command has completed. Any commands written while INTFLAG.READY is low will be ignored.

The [CTRLB](#) register must be used to control the power reduction mode, read wait states, and the write mode.

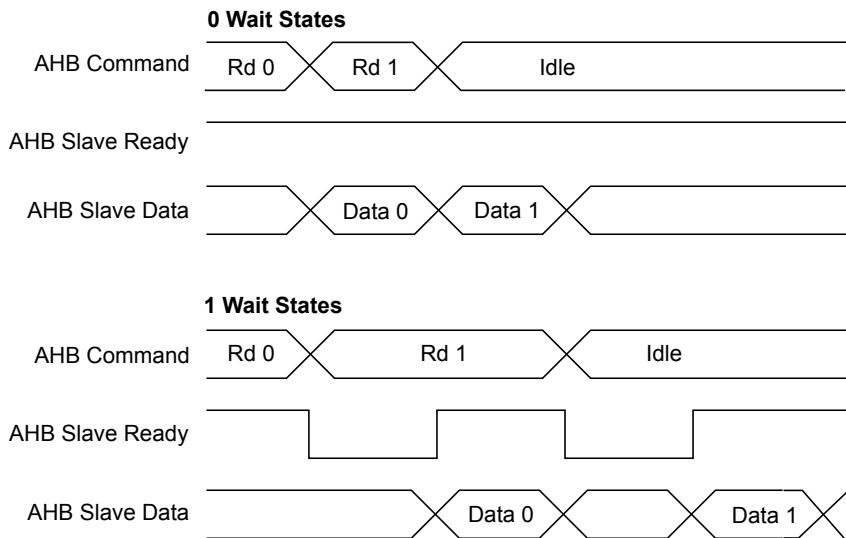

#### 21.6.4.1. NVM Read

Reading from the NVM main address space is performed via the AHB bus by addressing the NVM main address space or auxiliary address space directly. Read data is available after the configured number of read wait states (CTRLB.RWS) set in the NVM Controller.

The number of cycles data are delayed to the AHB bus is determined by the read wait states. Examples of using zero and one wait states are shown in Figure Read Wait State Examples below.

Reading the NVM main address space while a programming or erase operation is ongoing on the NVM main array results in an AHB bus stall until the end of the operation.

**Figure 21-5. Read Wait State Examples**

#### 21.6.4.2. NVM Write

The NVM Controller requires that an erase must be done before programming. The entire NVM main address space can be erased by a debugger Chip Erase command. Alternatively, rows can be individually erased by the Erase Row command.

After programming the NVM main array, the region that the page resides in can be locked to prevent spurious write or erase sequences. Locking is performed on a per-region basis, and so, locking a region will lock all pages inside the region.

Data to be written to the NVM block are first written to and stored in an internal buffer called the *page buffer*. The page buffer contains the same number of bytes as an NVM page. Writes to the page buffer must be 16 or 32 bits. 8-bit writes to the page buffer are not allowed and will cause a system exception.

Writing to the NVM block via the AHB bus is performed by a load operation to the page buffer. For each AHB bus write, the address is stored in the ADDR register. After the page buffer has been loaded with the required number of bytes, the page can be written to the NVM main array by setting CTRLA.CMD to 'Write Page' and setting the key value to CMDEX. The LOAD bit in the STATUS register indicates whether the page buffer has been loaded or not. Before writing the page to memory, the accessed row must be erased.

Automatic page writes are enabled by writing the manual write bit to zero (CTRLB.MANW=0). This will trigger a write operation to the page addressed by ADDR when the last location of the page is written.

Because the address is automatically stored in ADDR during the I/O bus write operation, the last given address will be present in the ADDR register. There is no need to load the ADDR register manually, unless a different page in memory is to be written.

#### **Procedure for Manual Page Writes (CTRLB.MANW=1)**

The row to be written to must be erased before the write command is given.

- Write to the page buffer by addressing the NVM main address space directly
- Write the page buffer to memory: CTRL.CMD='Write Page' and CMDEX
- The READY bit in the INTFLAG register will be low while programming is in progress, and access through the AHB will be stalled

#### **Procedure for Automatic Page Writes (CTRLB.MANW=0)**

The row to be written to must be erased before the last write to the page buffer is performed.

Note that partially written pages must be written with a manual write.

- Write to the page buffer by addressing the NVM main address space directly. When the last location in the page buffer is written, the page is automatically written to NVM main address space.
- INTFLAG.READY will be zero while programming is in progress and access through the AHB will be stalled.

#### **21.6.4.3. Page Buffer Clear**

The page buffer is automatically set to all '1' after a page write is performed. If a partial page has been written and it is desired to clear the contents of the page buffer, the Page Buffer Clear command can be used.

#### **21.6.4.4. Erase Row**

Before a page can be written, the row containing that page must be erased. The Erase Row command can be used to erase the desired row in the NVM main address space. Erasing the row sets all bits to '1'. If the row resides in a region that is locked, the erase will not be performed and the Lock Error bit in the Status register (STATUS.LOCKE) will be set.

#### **Procedure for Erase Row**

- Write the address of the row to erase to ADDR. Any address within the row can be used.
- Issue an Erase Row command.

**Note:** The NVM Address bit field in the Address register (ADDR.ADDR) uses 16-bit addressing.

#### 21.6.4.5. Lock and Unlock Region

These commands are used to lock and unlock regions as detailed in section [Region Lock Bits](#).

#### 21.6.4.6. Set and Clear Power Reduction Mode

The NVM Controller and block can be taken in and out of power reduction mode through the Set and Clear Power Reduction Mode commands. When the NVM Controller and block are in power reduction mode, the Power Reduction Mode bit in the Status register (STATUS.PRM) is set.

#### 21.6.5. NVM User Configuration

The NVM user configuration resides in the auxiliary space. Refer to the Physical Memory Map of the device for calibration and auxiliary space address mapping.

The bootloader resides in the main array starting at offset zero. The allocated boot loader section is write-protected.

**Table 21-2. Boot Loader Size**

BOOTPROT [2:0]	Rows Protected by BOOTPROT	Boot Loader Size in Bytes
0x7 <sup>(1)</sup>	None	0
0x6	2	512
0x5	4	1024
0x4	8	2048
0x3	16	4096
0x2	32	8192
0x1	64	16384
0x0	128	32768

**Note:** 1) Default value is 0x7.

The EEPROM[2:0] bits indicate the EEPROM size, see the table below. The EEPROM resides in the upper rows of the NVM main address space and is writable, regardless of the region lock status.

**Table 21-3. EEPROM Size**

EEPROM[2:0]	Rows Allocated to EEPROM	EEPROM Size in Bytes
7	None	0
6	1	256
5	2	512
4	4	1024
3	8	2048
2	16	4096
1	32	8192
0	64	16384

#### Related Links

[Physical Memory Map](#) on page 36

### **21.6.6. Security Bit**

The security bit allows the entire chip to be locked from external access for code security. The security bit can be written by a dedicated command, Set Security Bit (SSB). Once set, the only way to clear the security bit is through a debugger Chip Erase command. After issuing the SSB command, the PROGE error bit can be checked.

In order to increase the security level it is recommended to enable the internal BOD33 when the security bit is set.

#### **Related Links**

[DSU - Device Service Unit](#) on page 61

### **21.6.7. Cache**

The NVM Controller cache reduces the device power consumption and improves system performance when wait states are required. Only the NVM main array address space is cached. It is a direct-mapped cache that implements . NVM Controller cache can be enabled by writing a '0' to the Cache Disable bit in the Control B register ([CTRLB.CACHEDIS](#)).

The cache can be configured to three different modes using the Read Mode bit group in the Control B register ([CTRLB.READMODE](#)).

The INVALL command can be issued using the Command bits in the Control A register to invalidate all cache lines ([CTRLA.CMD=INVALL](#)). Commands affecting NVM content automatically invalidate cache lines.

## 21.7. Register Summary

## 21.8. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16-, and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers require synchronization when read and/or written. Synchronization is denoted by the "Read-Synchronized" and/or "Write-Synchronized" property in each individual register description.

Some registers are enable-protected, meaning they can only be written when the module is disabled. Enable-protection is denoted by the "Enable-Protected" property in each individual register description.

### 21.8.1. Control A

**Name:** CTRLA  
**Offset:** 0x00  
**Reset:** 0x0000  
**Property:** PAC Write-Protection

Bit	15	14	13	12	11	10	9	8
CMDEX[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
CMD[6:0]								
Access		R/W						
Reset		0	0	0	0	0	0	0

#### Bits 15:8 – CMDEX[7:0]: Command Execution

When this bit group is written to the key value 0xA5, the command written to CMD will be executed. If a value different from the key value is tried, the write will not be performed and the Programming Error bit in the Status register (STATUS.PROGE) will be set. PROGE is also set if a previously written command is not completed yet.

The key value must be written at the same time as CMD. If a command is issued through the APB bus on the same cycle as an AHB bus access, the AHB bus access will be given priority. The command will then be executed when the NVM block and the AHB bus are idle.

INTFLAG.READY must be '1' when the command is issued.

Bit 0 of the CMDEX bit group will read back as '1' until the command is issued.

**Note:** The NVM Address bit field in the Address register (ADDR.ADDR) uses 16-bit addressing.

#### Bits 6:0 – CMD[6:0]: Command

These bits define the command to be executed when the CMDEX key is written.

CMD[6:0]	Group Configuration	Description
0x00-0x01	-	Reserved
0x02	ER	Erase Row - Erases the row addressed by the ADDR register in the NVM main array.
0x03	-	Reserved
0x04	WP	Write Page - Writes the contents of the page buffer to the page addressed by the ADDR register.
0x05	EAR	Erase Auxiliary Row - Erases the auxiliary row addressed by the ADDR register. This command can be given only when the security bit is not set and only to the User Configuration Row.

CMD[6:0]	Group Configuration	Description
0x06	WAP	Write Auxiliary Page - Writes the contents of the page buffer to the page addressed by the ADDR register. This command can be given only when the security bit is not set and only to the User Configuration Row.
0x07-0x3F	-	Reserved
0x40	LR	Lock Region - Locks the region containing the address location in the ADDR register.
0x41	UR	Unlock Region - Unlocks the region containing the address location in the ADDR register.
0x42	SPRM	Sets the Power Reduction Mode.
0x43	CPRM	Clears the Power Reduction Mode.
0x44	PBC	Page Buffer Clear - Clears the page buffer.
0x45	SSB	Set Security Bit - Sets the security bit by writing 0x00 to the first byte in the lockbit row.
0x46	INVALL	Invalidates all cache lines.
0x47-0x7F	-	Reserved

## 21.8.2. Control B

### Bits 19:18 – CACHEDIS[1:0]: Cache Disable

These bits are used to enable/disable caching of the NVM and RWW EEPROM sections. The same cache is used for both sections.

Table 21-4. Cache Disabled

CACHEDIS[1:0]	RWW EEPROM	NVM Cache
0x0	Disabled	Enabled
0x1	Disabled	Disabled
0x2	Enabled	Enabled
0x3	Reserved	Reserved

Value	Description
0	The cache is enabled
1	The cache is disabled

### Bits 17:16 – READMODE[1:0]: NVMCTRL Read Mode

Value	Name	Description
0x0	NO_MISS_PENALTY	The NVM Controller (cache system) does not insert wait states on a cache miss. Gives the best system performance.
0x1	LOW_POWER	Reduces power consumption of the cache system, but inserts a wait state each time there is a cache miss. This mode may not be relevant if CPU performance is required, as the application will be stalled and may lead to increased run time.
0x2	DETERMINISTIC	The cache system ensures that a cache hit or miss takes the same amount of time, determined by the number of programmed Flash wait states. This mode can be used for real-time applications that require deterministic execution timings.
0x3	Reserved	

#### **Bits 9:8 – SLEEP prm[1:0]: Power Reduction Mode during Sleep**

Indicates the Power Reduction Mode during sleep.

Value	Name	Description
0x0	WAKEUPACCESS	NVM block enters low-power mode when entering sleep. NVM block exits low-power mode upon first access.
0x1	WAKEUPINSTANT	NVM block enters low-power mode when entering sleep. NVM block exits low-power mode when exiting sleep.
0x2	Reserved	
0x3	DISABLED	Auto power reduction disabled.

#### **Bit 7 – MANW: Manual Write**

Note that reset value of this bit is '1'.

Value	Description
0	Writing to the last word in the page buffer will initiate a write operation to the page addressed by the last write operation. This includes writes to memory and auxiliary rows.
1	Write commands must be issued through the CTRLA.CMD register.

#### **Bits 4:1 – RWS[3:0]: NVM Read Wait States**

These bits control the number of wait states for a read operation. '0' indicates zero wait states, '1' indicates one wait state, etc., up to 15 wait states.

This register is initialized to 0 wait states. Software can change this value based on the NVM access time and system frequency.

### 21.8.3. NVM Parameter

**Name:** PARAM  
**Offset:** 0x08  
**Reset:** 0x000XXXXX  
**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
								
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
								
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 18:16 – PSZ[2:0]: Page Size

Indicates the page size. Not all devices of the device families will provide all the page sizes indicated in the table.

Value	Name	Description
0x0	8	8 bytes
0x1	16	16 bytes
0x2	32	32 bytes
0x3	64	64 bytes
0x4	128	128 bytes
0x5	256	256 bytes
0x6	512	512 bytes
0x7	1024	1024 bytes

#### Bits 15:0 – NVMP[15:0]: NVM Pages

Indicates the number of pages in the NVM main address space.

#### 21.8.4. Interrupt Enable Clear

This register allows the user to disable an interrupt without doing a read-modify-write operation. Changes in this register will also be reflected in the Interrupt Enable Set register (INTENSET).

**Name:** INTENCLR

**Offset:** 0x0C

**Reset:** 0x00

**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access							ERROR	READY
Reset							0	0

##### **Bit 1 – ERROR: Error Interrupt Enable**

Writing a '0' to this bit has no effect.

Writing a '1' to this bit clears the ERROR interrupt enable.

This bit will read as the current value of the ERROR interrupt enable.

##### **Bit 0 – READY: NVM Ready Interrupt Enable**

Writing a '0' to this bit has no effect.

Writing a '1' to this bit clears the READY interrupt enable.

This bit will read as the current value of the READY interrupt enable.

### 21.8.5. Interrupt Enable Set

This register allows the user to enable an interrupt without doing a read-modify-write operation. Changes in this register will also be reflected in the Interrupt Enable Clear register (INTENCLR).

**Name:** INTENSET

**Offset:** 0x10

**Reset:** 0x00

**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access							ERROR	READY
Reset							0	0

#### Bit 1 – ERROR: Error Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a '1' to this bit sets the ERROR interrupt enable.

This bit will read as the current value of the ERROR interrupt enable.

#### Bit 0 – READY: NVM Ready Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a '1' to this bit sets the READY interrupt enable.

This bit will read as the current value of the READY interrupt enable.

## 21.8.6. Interrupt Flag Status and Clear

**Name:** INTFLAG

**Offset:** 0x14

**Reset:** 0x00

**Property:** –

Bit	7	6	5	4	3	2	1	0
Access							ERROR	READY
Reset							R/W	R

### Bit 1 – ERROR: Error

This flag is set on the occurrence of an NVME, LOCKE or PROGE error.

This bit can be cleared by writing a '1' to its bit location.

Value	Description
0	No errors have been received since the last clear.
1	At least one error has occurred since the last clear.

### Bit 0 – READY: NVM Ready

Value	Description
0	The NVM controller is busy programming or erasing.
1	The NVM controller is ready to accept a new command.

### 21.8.7. Status

**Name:** STATUS

**Offset:** 0x18

**Reset:** 0x0X00

**Property:** –

Bit	15	14	13	12	11	10	9	8
								SB
Access								R
Reset								0
Bit	7	6	5	4	3	2	1	0
				NVME	LOCKE	PROGE	LOAD	PRM
Access				R/W	R/W	R/W	R/W	R
Reset				0	0	0	0	0

#### Bit 8 – SB: Security Bit Status

Value	Description
0	The Security bit is inactive.
1	The Security bit is active.

#### Bit 4 – NVME: NVM Error

This bit can be cleared by writing a '1' to its bit location.

Value	Description
0	No programming or erase errors have been received from the NVM controller since this bit was last cleared.
1	At least one error has been registered from the NVM Controller since this bit was last cleared.

#### Bit 3 – LOCKE: Lock Error Status

This bit can be cleared by writing a '1' to its bit location.

Value	Description
0	No programming of any locked lock region has happened since this bit was last cleared.
1	Programming of at least one locked lock region has happened since this bit was last cleared.

#### Bit 2 – PROGE: Programming Error Status

This bit can be cleared by writing a '1' to its bit location.

Value	Description
0	No invalid commands or bad keywords were written in the NVM Command register since this bit was last cleared.
1	An invalid command and/or a bad keyword was/were written in the NVM Command register since this bit was last cleared.

### **Bit 1 – LOAD: NVM Page Buffer Active Loading**

This bit indicates that the NVM page buffer has been loaded with one or more words. Immediately after an NVM load has been performed, this flag is set. It remains set until a page write or a page buffer clear (PBCLR) command is given.

This bit can be cleared by writing a '1' to its bit location.

### **Bit 0 – PRM: Power Reduction Mode**

This bit indicates the current NVM power reduction state. The NVM block can be set in power reduction mode in two ways: through the command interface or automatically when entering sleep with SLEEP prm set accordingly.

PRM can be cleared in three ways: through AHB access to the NVM block, through the command interface (SPRM and CPRM) or when exiting sleep with SLEEP prm set accordingly.

Value	Description
0	NVM is not in power reduction mode.
1	NVM is in power reduction mode.

## 21.8.8. Address

**Name:** ADDR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset				0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access	R/W							
Reset	0	0	0	0	0	0	0	0

### Bits 21:0 – ADDR[21:0]: NVM Address

ADDR drives the hardware (16-bit) address to the NVM when a command is executed using CMDEX. This register is also automatically updated when writing to the page buffer.

### 21.8.9. Lock Section

**Name:** LOCK

**Offset:** 0x20

**Reset:** 0xFFFF

**Property:** –

Bit	15	14	13	12	11	10	9	8
LOCK[15:8]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
LOCK[7:0]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – LOCK[15:0]: Region Lock Bits

In order to set or clear these bits, the CMD register must be used.

Default state after erase will be unlocked (0x0000).

Value	Description
0	The corresponding lock region is locked.
1	The corresponding lock region is not locked.

## 22. PORT - I/O Pin Controller

### 22.1. Overview

The IO Pin Controller (PORT) controls the I/O pins of the device. The I/O pins are organized in a series of groups, collectively referred to as a PORT group. Each PORT group can have up to 32 pins that can be configured and controlled individually or as a group. The number of PORT groups on a device may depend on the package/number of pins. Each pin may either be used for general-purpose I/O under direct application control or be assigned to an embedded device peripheral. When used for general-purpose I/O, each pin can be configured as input or output, with highly configurable driver and pull settings.

All I/O pins have true read-modify-write functionality when used for general-purpose I/O; the direction or the output value of one or more pins may be changed (set, reset or toggled) explicitly without unintentionally changing the state of any other pins in the same port group by a single, atomic 8-, 16- or 32-bit write.

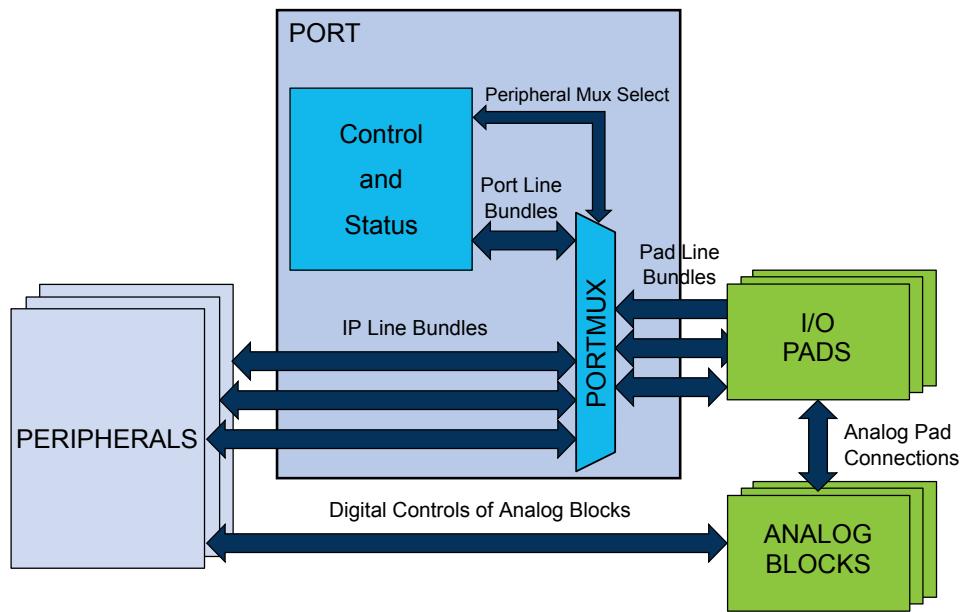

The PORT is connected to the high-speed bus matrix through an AHB/APB bridge. The Pin Direction, Data Output Value and Data Input Value registers may also be accessed using the low-latency CPU local bus (IOBUS; ARM® single-cycle I/O port).

### 22.2. Features

- Selectable input and output configuration for each individual pin
- Software-controlled multiplexing of peripheral functions on I/O pins
- Flexible pin configuration through a dedicated Pin Configuration register
- Configurable output driver and pull settings:
  - Totem-pole (push-pull)
  - Pull configuration
  - Driver strength
- Configurable input buffer and pull settings:
  - Internal pull-up or pull-down
  - Input sampling criteria
  - Input buffer can be disabled if not needed for lower power consumption
- Power saving using STANDBY mode
  - No access to configuration registers
  - Possible access to data registers (DIR, OUT or IN)

## 22.3. Block Diagram

Figure 22-1. PORT Block Diagram

## 22.4. Signal Description

Table 22-1. Signal description for PORT

Signal name	Type	Description
Pxy	Digital I/O	General-purpose I/O pin y in group x

Refer to the *I/O Multiplexing and Considerations* for details on the pin mapping for this peripheral. One signal can be mapped on several pins.

### Related Links

[I/O Multiplexing and Considerations](#) on page 27

## 22.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly as following.

### 22.5.1. I/O Lines

The I/O lines of the PORT are mapped to pins of the physical device. The following naming scheme is used:

Each line bundle with up to 32 lines is assigned an identifier 'xy', with letter x=A, B, C... and two-digit number y=00, 01, ...31. Examples: A24, C03.

PORT pins are labeled 'Pxy' accordingly, for example PA24, PC03. This identifies each pin in the device uniquely.

Each pin may be controlled by one or more peripheral multiplexer settings, which allow the pad to be routed internally to a dedicated peripheral function. When the setting is enabled, the selected peripheral

has control over the output state of the pad, as well as the ability to read the current physical pad state. Refer to *I/O Multiplexing and Considerations* for details.

Device-specific configurations may cause some lines (and the corresponding Pxy pin) not to be implemented.

#### Related Links

[I/O Multiplexing and Considerations](#) on page 27

### 22.5.2. Power Management

During reset, all PORT lines are configured as inputs with input buffers, output buffers and pull disabled.

If the PORT peripheral is shut down, the latches in the pad will keep their current configuration in any sleep mode, such as the output value and pull settings. However, the PORT configuration registers and input synchronizers will lose their contents, and these will not be restored when PORT is powered up again. Therefore, user must reconfigure the PORT peripheral at power-up to ensure it is in a well-defined state before use.

The PORT will continue operating in any sleep mode where the selected module source clock is running because the selected module source clock is still running.

### 22.5.3. Clocks

The PORT bus clock (CLK\_PORT\_APB) can be enabled and disabled in the Power Manager, and the default state of CLK\_PORT\_APB can be found in the *Peripheral Clock Masking* section in *PM – Power Manager*.

The PORT is fed by two different clocks: a CPU main clock, which allows the CPU to access the PORT through the low latency CPU local bus (IOBUS); an APB clock, which is a divided clock of the CPU main clock and allows the CPU to access the registers of PORT through the high-speed matrix and the AHB/APB bridge.

The priority of IOBUS accesses is higher than event accesses and APB accesses. The EVSYS and APB will insert wait states in the event of concurrent PORT accesses.

The PORT input synchronizers use the CPU main clock so that the resynchronization delay is minimized with respect to the APB clock.

#### Related Links

[PM – Power Manager](#) on page 129

### 22.5.4. Interrupts

Not applicable.

### 22.5.5. Events

The events of this peripheral are connected to the Event System.

#### Related Links

[EVSYS – Event System](#) on page 349

### 22.5.6. Debug Operation

When the CPU is halted in debug mode, this peripheral will continue normal operation. If the peripheral is configured to require periodical service by the CPU through interrupts or similar, improper operation or data loss may result during debugging. This peripheral can be forced to halt operation during debugging - refer to the Debug Control (DBGCTRL) register for details.

### **22.5.7. Register Access Protection**

All registers with write-access can be optionally write-protected by the Peripheral Access Controller (PAC).

**Note:** Optional write-protection is indicated by the "PAC Write-Protection" property in the register description.

When the CPU is halted in debug mode, all write-protection is automatically disabled. Write-protection does not apply for accesses through an external debugger.

#### **Related Links**

[PAC - Peripheral Access Controller](#) on page 45

### **22.5.8. Analog Connections**

Analog functions are connected directly between the analog blocks and the I/O pads using analog buses. However, selecting an analog peripheral function for a given pin will disable the corresponding digital features of the pad.

### **22.5.9. CPU Local Bus**

The CPU local bus (IOBUS) is an interface that connects the CPU directly to the PORT. It is a single-cycle bus interface, which does not support wait states. It supports 8-bit, 16-bit and 32-bit sizes.

This bus is generally used for low latency operation. The Data Direction (DIR) and Data Output Value (OUT) registers can be read, written, set, cleared or be toggled using this bus, and the Data Input Value (IN) registers can be read.

Since the IOBUS cannot wait for IN register resynchronization, the Control register (CTRL) must be configured to continuous sampling of all pins that need to be read via the IOBUS in order to prevent stale data from being read.

## 22.6. Functional Description

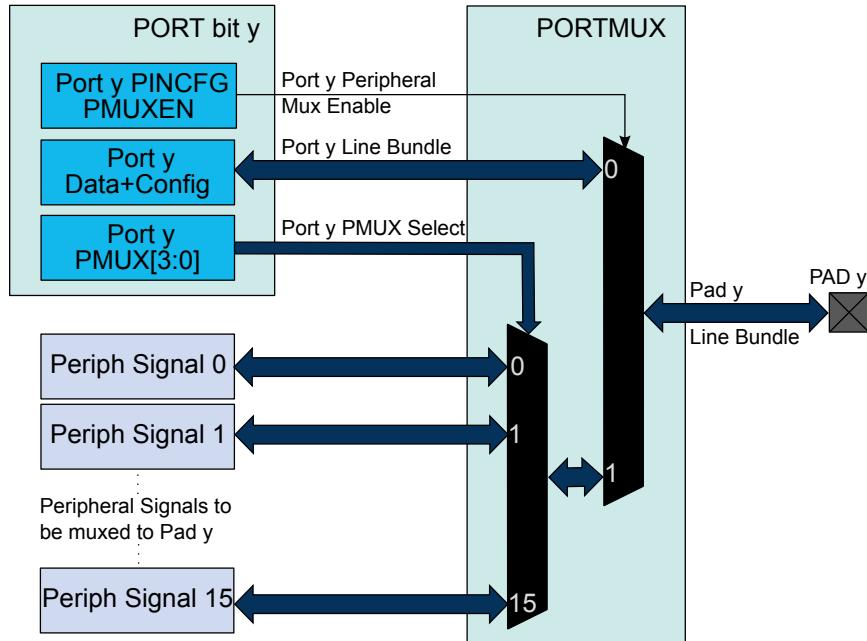

Figure 22-2. Overview of the PORT

### 22.6.1. Principle of Operation

Each PORT group of up to 32 pins is controlled by the registers in PORT, as described in the figure. These registers in PORT are duplicated for each PORT group, with increasing base addresses. The number of PORT groups may depend on the package/number of pins.

Figure 22-3. Overview of the peripheral functions multiplexing

The I/O pins of the device are controlled by PORT peripheral registers. Each port pin has a corresponding bit in the Data Direction (DIR) and Data Output Value (OUT) registers to enable that pin as an output and to define the output state.

The direction of each pin in a PORT group is configured by the DIR register. If a bit in DIR is set to '1', the corresponding pin is configured as an output pin. If a bit in DIR is set to '0', the corresponding pin is configured as an input pin.

When the direction is set as output, the corresponding bit in the OUT register will set the level of the pin. If bit y in OUT is written to '1', pin y is driven HIGH. If bit y in OUT is written to '0', pin y is driven LOW. Pin configuration can be set by Pin Configuration (PINCFGy) registers, with y=00, 01, ..31 representing the bit position.

The Data Input Value (IN) is set as the input value of a port pin with resynchronization to the PORT clock. To reduce power consumption, these input synchronizers are clocked only when system requires reading the input value. The value of the pin can always be read, whether the pin is configured as input or output. If the Input Enable bit in the Pin Configuration registers (PINCFGy.INEN) is '0', the input value will not be sampled.

In PORT, the Peripheral Multiplexer Enable bit in the PINCFGy register (PINCFGy.PMUXEN) can be written to '1' to enable the connection between peripheral functions and individual I/O pins. The Peripheral Multiplexing n (PMUXn) registers select the peripheral function for the corresponding pin. This will override the connection between the PORT and that I/O pin, and connect the selected peripheral signal to the particular I/O pin instead of the PORT line bundle.

### Related Links

[PMUXn](#) on page 345

## 22.6.2. Basic Operation

### 22.6.2.1. Initialization

After reset, all standard function device I/O pads are connected to the PORT with outputs tri-stated and input buffers disabled, even if there is no clock running.

However, specific pins, such as those used for connection to a debugger, may be configured differently, as required by their special function.

### 22.6.2.2. Operation

Each I/O pin y can be controlled by the registers in PORT. Each PORT group has its own set of PORT registers, the base address of the register set for pin y is at byte address PORT + ([y] \* 0x4). The index within that register set is [y].

To use pin number y as an *output*, write bit y of the DIR register to '1'. This can also be done by writing bit y in the DIRSET register to '1' - this will avoid disturbing the configuration of other pins in that group. The y bit in the OUT register must be written to the desired output value.

Similarly, writing an OUTSET bit to '1' will set the corresponding bit in the OUT register to '1'. Writing a bit in OUTCLR to '1' will set that bit in OUT to zero. Writing a bit in OUTTGL to '1' will toggle that bit in OUT.

To use pin y as an *input*, bit y in the DIR register must be written to '0'. This can also be done by writing bit y in the DIRCLR register to '1' - this will avoid disturbing the configuration of other pins in that group.

The input value can be read from bit y in register IN as soon as the INEN bit in the Pin Configuration register (PINCFGy.INEN) is written to '1'.

Refer to *I/O Multiplexing and Considerations* for details on pin configuration and PORT groups.

By default, the input synchronizer is clocked only when an input read is requested. This will delay the read operation by two CLK\_PORT cycles. To remove the delay, the input synchronizers for each PORT group of eight pins can be configured to be always active, but this will increase power consumption. This is enabled by writing '1' to the corresponding SAMPLINGn bit field of the CTRL register, see CTRL.SAMPLING for details.

To use pin y as one of the available peripheral functions, the corresponding PMUXEN bit of the PINCFGy register must be '1'. The PINCFGy register for pin y is at byte offset (PINCFG0 + [y]).

The peripheral function can be selected by setting the PMUXO or PMUXE in the PMUXn register. The PMUXO/PMUXE is at byte offset PMUX0 + (y/2). The chosen peripheral must also be configured and enabled.

#### Related Links

[I/O Multiplexing and Considerations](#) on page 27

### 22.6.3. I/O Pin Configuration

The Pin Configuration register (PINCFGy) is used for additional I/O pin configuration. A pin can be set in a totem-pole or pull configuration.

As pull configuration is done through the Pin Configuration register, all intermediate PORT states during switching of pin direction and pin values are avoided.

The I/O pin configurations are described further in this chapter, and summarized in [Table 22-2](#).

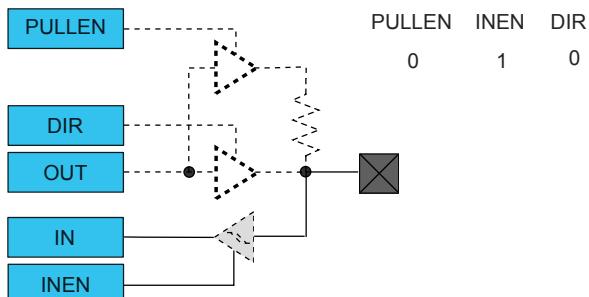

#### 22.6.3.1. Pin Configurations Summary

**Table 22-2. Pin Configurations Summary**

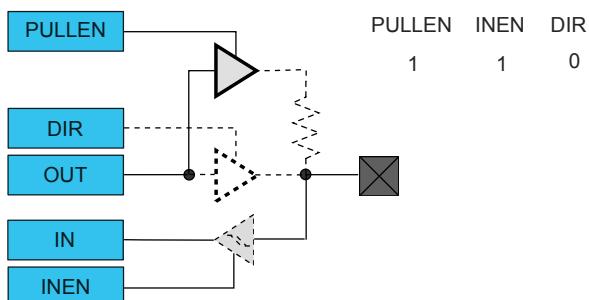

DIR	INEN	PULLEN	OUT	Configuration
0	0	0	X	Reset or analog I/O: all digital disabled
0	0	1	0	Pull-down; input disabled
0	0	1	1	Pull-up; input disabled
0	1	0	X	Input
0	1	1	0	Input with pull-down
0	1	1	1	Input with pull-up
1	0	X	X	Output; input disabled
1	1	X	X	Output; input enabled

### 22.6.3.2. Input Configuration

**Figure 22-4. I/O configuration - Standard Input**

**Figure 22-5. I/O Configuration - Input with Pull**

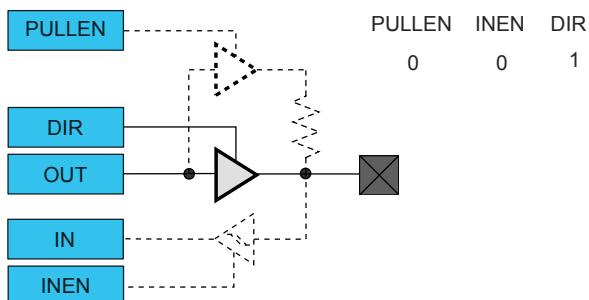

**Note:** When pull is enabled, the pull value is defined by the OUT value.

### 22.6.3.3. Totem-Pole Output

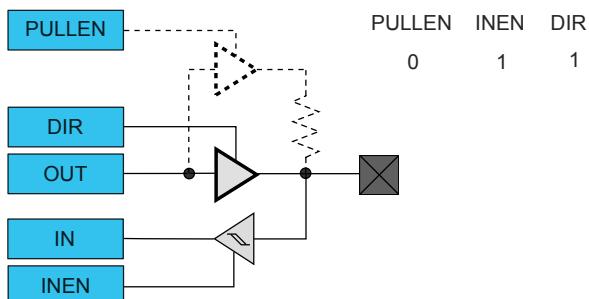

When configured for totem-pole (push-pull) output, the pin is driven low or high according to the corresponding bit setting in the OUT register. In this configuration there is no current limitation for sink or source other than what the pin is capable of. If the pin is configured for input, the pin will float if no external pull is connected.

**Note:** Enabling the output driver will automatically disable pull.

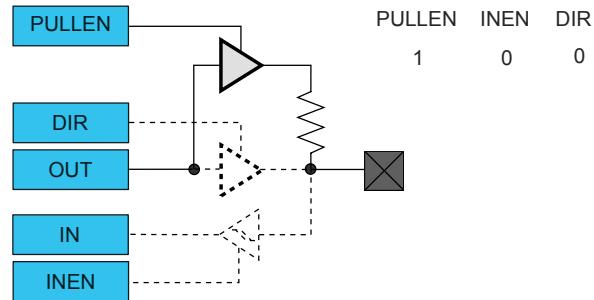

**Figure 22-6. I/O Configuration - Totem-Pole Output with Disabled Input**

**Figure 22-7. I/O Configuration - Totem-Pole Output with Enabled Input**

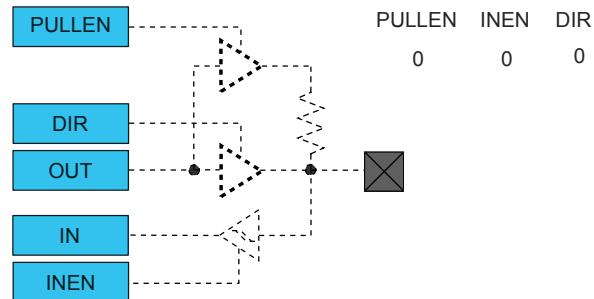

**Figure 22-8. I/O Configuration - Output with Pull**

#### 22.6.3.4. Digital Functionality Disabled

Neither Input nor Output functionality are enabled.

**Figure 22-9. I/O Configuration - Reset or Analog I/O: Digital Output, Input and Pull Disabled**

#### 22.6.4. PORT Access Priority

The PORT is accessed by different systems:

- The ARM® CPU through the ARM® single-cycle I/O port (IOBUS)
- The ARM® CPU through the high-speed matrix and the AHB/APB bridge (APB)

The following priority is adopted:

1. ARM® CPU IOBUS (No wait tolerated)
2. APB

## 22.7. Register Summary

Offset	Name	Bit Pos.

## 22.8. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16- and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers are optionally write-protected by the Peripheral Access Controller (PAC). Optional PAC write-protection is denoted by the "PAC Write-Protection" property in each individual register description. For details, refer to [Register Access Protection](#).

### 22.8.1. Data Direction

This register allows the user to configure one or more I/O pins as an input or output. This register can be manipulated without doing a read-modify-write operation by using the Data Direction Toggle (DIRTGL), Data Direction Clear (DIRCLR) and Data Direction Set (DIRSET) registers.

**Name:** DIR

**Offset:** 0x00

**Reset:** 0x00000000

**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
DIR[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DIR[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DIR[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DIR[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – DIR[31:0]: Port Data Direction

These bits set the data direction for the individual I/O pins in the PORT group.

Value	Description
0	The corresponding I/O pin in the PORT group is configured as an input.
1	The corresponding I/O pin in the PORT group is configured as an output.

## 22.8.2. Data Direction Clear

This register allows the user to set one or more I/O pins as an input, without doing a read-modify-write operation. Changes in this register will also be reflected in the Data Direction (DIR), Data Direction Toggle (DIRTGL) and Data Direction Set (DIRSET) registers.

**Name:** DIRCLR

**Offset:** 0x04

**Reset:** 0x00000000

**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
DIRCLR[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DIRCLR[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DIRCLR[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DIRCLR[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – DIRCLR[31:0]: Port Data Direction Clear

Writing a '0' to a bit has no effect.

Writing a '1' to a bit will clear the corresponding bit in the DIR register, which configures the I/O pin as an input.

Value	Description
0	The corresponding I/O pin in the PORT group will keep its configuration.
1	The corresponding I/O pin in the PORT group is configured as input.

### 22.8.3. Data Direction Set

This register allows the user to set one or more I/O pins as an output, without doing a read-modify-write operation. Changes in this register will also be reflected in the Data Direction (DIR), Data Direction Toggle (DIRTGL) and Data Direction Clear (DIRCLR) registers.

**Name:** DIRSET

**Offset:** 0x08

**Reset:** 0x00000000

**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
DIRSET[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DIRSET[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DIRSET[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DIRSET[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – DIRSET[31:0]: Port Data Direction Set

Writing '0' to a bit has no effect.

Writing '1' to a bit will set the corresponding bit in the DIR register, which configures the I/O pin as an output.

Value	Description
0	The corresponding I/O pin in the PORT group will keep its configuration.
1	The corresponding I/O pin in the PORT group is configured as an output.

## 22.8.4. Data Direction Toggle

This register allows the user to toggle the direction of one or more I/O pins, without doing a read-modify-write operation. Changes in this register will also be reflected in the Data Direction (DIR), Data Direction Set (DIRSET) and Data Direction Clear (DIRCLR) registers.

**Name:** DIRTGL

**Offset:** 0x0C

**Reset:** 0x00000000

**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
DIRTGL[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DIRTGL[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DIRTGL[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
DIRTGL[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – DIRTGL[31:0]: Port Data Direction Toggle

Writing '0' to a bit has no effect.

Writing '1' to a bit will toggle the corresponding bit in the DIR register, which reverses the direction of the I/O pin.

Value	Description
0	The corresponding I/O pin in the PORT group will keep its configuration.
1	The direction of the corresponding I/O pin is toggled.

## 22.8.5. Data Output Value

This register sets the data output drive value for the individual I/O pins in the PORT.

This register can be manipulated without doing a read-modify-write operation by using the Data Output Value Clear (OUTCLR), Data Output Value Set (OUTSET), and Data Output Value Toggle (OUTTGL) registers.

**Name:** OUT

**Offset:** 0x10

**Reset:** 0x00000000

**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
OUT[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
OUT[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
OUT[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
OUT[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – OUT[31:0]: PORT Data Output Value

For pins configured as outputs via the Data Direction register (DIR), these bits set the logical output drive level.

For pins configured as inputs via the Data Direction register (DIR) and with pull enabled via the Pull Enable bit in the Pin Configuration register (PINCFG.PULLEN), these bits will set the input pull direction.

Value	Description
0	The I/O pin output is driven low, or the input is connected to an internal pull-down.
1	The I/O pin output is driven high, or the input is connected to an internal pull-up.

## 22.8.6. Data Output Value Clear

This register allows the user to set one or more output I/O pin drive levels low, without doing a read-modify-write operation. Changes in this register will also be reflected in the Data Output Value (OUT), Data Output Value Toggle (OUTTGL) and Data Output Value Set (OUTSET) registers.

**Name:** OUTCLR

**Offset:** 0x14

**Reset:** 0x00000000

**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
OUTCLR[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
OUTCLR[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
OUTCLR[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
OUTCLR[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – OUTCLR[31:0]: PORT Data Output Value Clear

Writing '0' to a bit has no effect.

Writing '1' to a bit will clear the corresponding bit in the OUT register. Pins configured as outputs via the Data Direction register (DIR) will be set to low output drive level. Pins configured as inputs via DIR and with pull enabled via the Pull Enable bit in the Pin Configuration register (PINCFG.PULLEN) will set the input pull direction to an internal pull-down.

Value	Description
0	The corresponding I/O pin in the PORT group will keep its configuration.
1	The corresponding I/O pin output is driven low, or the input is connected to an internal pull-down.

## 22.8.7. Data Output Value Set

This register allows the user to set one or more output I/O pin drive levels high, without doing a read-modify-write operation. Changes in this register will also be reflected in the Data Output Value (OUT), Data Output Value Toggle (OUTTGL) and Data Output Value Clear (OUTCLR) registers.

**Name:** OUTSET

**Offset:** 0x18

**Reset:** 0x00000000

**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
OUTSET[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
OUTSET[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
OUTSET[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
OUTSET[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – OUTSET[31:0]: PORT Data Output Value Set

Writing '0' to a bit has no effect.

Writing '1' to a bit will set the corresponding bit in the OUT register, which sets the output drive level high for I/O pins configured as outputs via the Data Direction register (DIR). For pins configured as inputs via Data Direction register (DIR) with pull enabled via the Pull Enable register (PULLEN), these bits will set the input pull direction to an internal pull-up.

Value	Description
0	The corresponding I/O pin in the group will keep its configuration.
1	The corresponding I/O pin output is driven high, or the input is connected to an internal pull-up.

## 22.8.8. Data Output Value Toggle

This register allows the user to toggle the drive level of one or more output I/O pins, without doing a read-modify-write operation. Changes in this register will also be reflected in the Data Output Value (OUT), Data Output Value Set (OUTSET) and Data Output Value Clear (OUTCLR) registers.

**Name:** OUTTGL

**Offset:** 0x1C

**Reset:** 0x00000000

**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
OUTTGL[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
OUTTGL[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
OUTTGL[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
OUTTGL[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – OUTTGL[31:0]: PORT Data Output Value Toggle

Writing '0' to a bit has no effect.

Writing '1' to a bit will toggle the corresponding bit in the OUT register, which inverts the output drive level for I/O pins configured as outputs via the Data Direction register (DIR). For pins configured as inputs via Data Direction register (DIR) with pull enabled via the Pull Enable register (PULLEN), these bits will toggle the input pull direction.

Value	Description
0	The corresponding I/O pin in the PORT group will keep its configuration.
1	The corresponding OUT bit value is toggled.

## 22.8.9. Data Input Value

**Name:** IN  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** -

Bit	31	30	29	28	27	26	25	24
IN[31:24]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
IN[23:16]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
IN[15:8]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
IN[7:0]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – IN[31:0]: PORT Data Input Value

These bits are cleared when the corresponding I/O pin input sampler detects a logical low level on the input pin.

These bits are set when the corresponding I/O pin input sampler detects a logical high level on the input pin.

## 22.8.10. Control

**Name:** CTRL  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24
SAMPLING[31:24]								
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
SAMPLING[23:16]								
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
SAMPLING[15:8]								
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
SAMPLING[7:0]								
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – SAMPLING[31:0]: Input Sampling Mode

Configures the input sampling functionality of the I/O pin input samplers, for pins configured as inputs via the Data Direction register (DIR).

The input samplers are enabled and disabled in sub-groups of eight. Thus if any pins within a byte request continuous sampling, all pins in that eight pin sub-group will be continuously sampled.

Value	Description
0	The I/O pin input synchronizer is disabled.
1	The I/O pin input synchronizer is enabled.

### 22.8.11. Write Configuration

This write-only register is used to configure several pins simultaneously with the same configuration and/or peripheral multiplexing.

In order to avoid side effect of non-atomic access, 8-bit or 16-bit writes to this register will have no effect. Reading this register always returns zero.

**Name:** WRCONFIG  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** PAC Write-Protection

Bit	31	30	29	28	27	26	25	24	
	HWSEL	WRPINCFG		WRPMUX	PMUX[3:0]				
Access	W	W		W	W	W	W	W	
Reset	0	0		0	0	0	0	0	
Bit	23	22	21	20	19	18	17	16	
		DRVSTR				PULLEN	INEN	PMUXEN	
Access		W				W	W	W	
Reset		0				0	0	0	
Bit	15	14	13	12	11	10	9	8	
	PINMASK[15:8]								
Access	W	W	W	W	W	W	W	W	
Reset	0	0	0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
	PINMASK[7:0]								
Access	W	W	W	W	W	W	W	W	
Reset	0	0	0	0	0	0	0	0	

#### Bit 31 – HWSEL: Half-Word Select

This bit selects the half-word field of a 32-PORT group to be reconfigured in the atomic write operation.

This bit will always read as zero.

Value	Description
0	The lower 16 pins of the PORT group will be configured.
1	The upper 16 pins of the PORT group will be configured.

#### Bit 30 – WRPINCFG: Write PINCFG

This bit determines whether the atomic write operation will update the Pin Configuration register (PINCFGy) or not for all pins selected by the WRCONFIG.PINMASK and WRCONFIG.HWSEL bits.

Writing '0' to this bit has no effect.

Writing '1' to this bit updates the configuration of the selected pins with the written WRCONFIG.DRVSTR, WRCONFIG.PULLEN, WRCONFIG.INEN, WRCONFIG.PMUXEN and WRCONFIG.PINMASK values.

This bit will always read as zero.

Value	Description
0	The PINCFGy registers of the selected pins will not be updated.
1	The PINCFGy registers of the selected pins will be updated.

#### **Bit 28 – WRPMUX: Write PMUX**

This bit determines whether the atomic write operation will update the Peripheral Multiplexing register (PMUXn) or not for all pins selected by the WRCONFIG.PINMASK and WRCONFIG.HWSEL bits.

Writing '0' to this bit has no effect.

Writing '1' to this bit updates the pin multiplexer configuration of the selected pins with the written WRCONFIG.PMUX value.

This bit will always read as zero.

Value	Description
0	The PMUXn registers of the selected pins will not be updated.
1	The PMUXn registers of the selected pins will be updated.

#### **Bits 27:24 – PMUX[3:0]: Peripheral Multiplexing**

These bits determine the new value written to the Peripheral Multiplexing register (PMUXn) for all pins selected by the WRCONFIG.PINMASK and WRCONFIG.HWSEL bits, when the WRCONFIG.WRPMUX bit is set.

These bits will always read as zero.

#### **Bit 22 – DRVSTR: Output Driver Strength Selection**

This bit determines the new value written to PINCFGy.DRVSTR for all pins selected by the WRCONFIG.PINMASK and WRCONFIG.HWSEL bits, when the WRCONFIG.WRPINCFG bit is set.

This bit will always read as zero.

#### **Bit 18 – PULLEN: Pull Enable**

This bit determines the new value written to PINCFGy.PULLEN for all pins selected by the WRCONFIG.PINMASK and WRCONFIG.HWSEL bits, when the WRCONFIG.WRPINCFG bit is set.

This bit will always read as zero.

#### **Bit 17 – INEN: Input Enable**

This bit determines the new value written to PINCFGy.INEN for all pins selected by the WRCONFIG.PINMASK and WRCONFIG.HWSEL bits, when the WRCONFIG.WRPINCFG bit is set.

This bit will always read as zero.

#### **Bit 16 – PMUXEN: Peripheral Multiplexer Enable**

This bit determines the new value written to PINCFGy.PMUXEN for all pins selected by the WRCONFIG.PINMASK and WRCONFIG.HWSEL bits, when the WRCONFIG.WRPINCFG bit is set.

This bit will always read as zero.

#### **Bits 15:0 – PINMASK[15:0]: Pin Mask for Multiple Pin Configuration**

These bits select the pins to be configured within the half-word group selected by the WRCONFIG.HWSEL bit.

These bits will always read as zero.

Value	Description
0	The configuration of the corresponding I/O pin in the half-word group will be left unchanged.
1	The configuration of the corresponding I/O pin in the half-word PORT group will be updated.

## 22.8.12. Peripheral Multiplexing n

There are up to 16 Peripheral Multiplexing registers in each group, one for every set of two subsequent I/O lines. The n denotes the number of the set of I/O lines.

**Name:** PMUXn

**Offset:** 0x30 + n\*0x01 [n=0..15]

**Reset:** 0x00

**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
	PMUXO[3:0]					PMUXE[3:0]		
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 7:4 – PMUXO[3:0]: Peripheral Multiplexing for Odd-Numbered Pin

These bits select the peripheral function for odd-numbered pins ( $2*n + 1$ ) of a PORT group, if the corresponding PINCFGy.PMUXEN bit is '1'.

Not all possible values for this selection may be valid. For more details, refer to the *I/O Multiplexing and Considerations*.

PMUXO[3:0]	Name	Description
0x0	A	Peripheral function A selected
0x1	B	Peripheral function B selected
0x2	C	Peripheral function C selected
0x3	D	Peripheral function D selected
0x4	E	Peripheral function E selected
0x5	F	Peripheral function F selected
0x6	G	Peripheral function G selected
0x7	H	Peripheral function H selected
0x8	I	Peripheral function I selected
0x9-0xF	-	Reserved

### Bits 3:0 – PMUXE[3:0]: Peripheral Multiplexing for Even-Numbered Pin

These bits select the peripheral function for even-numbered pins ( $2*n$ ) of a PORT group, if the corresponding PINCFGy.PMUXEN bit is '1'.

Not all possible values for this selection may be valid. For more details, refer to the *I/O Multiplexing and Considerations*.

PMUXE[3:0]	Name	Description
0x0	A	Peripheral function A selected
0x1	B	Peripheral function B selected
0x2	C	Peripheral function C selected

<b>PMUXE[3:0]</b>	<b>Name</b>	<b>Description</b>
0x3	D	Peripheral function D selected
0x4	E	Peripheral function E selected
0x5	F	Peripheral function F selected
0x6	G	Peripheral function G selected
0x7	H	Peripheral function H selected
0x8	I	Peripheral function I selected
0x9-0xF	-	Reserved

### 22.8.13. Pin Configuration

There are up to 32 Pin Configuration registers in each PORT group, one for each I/O line.

**Name:** PINCFG<sub>n</sub>  
**Offset:** 0x40 + n\*0x01 [n=0..31]  
**Reset:** 0x00  
**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
		DRVSTR				PULLEN	INEN	PMUXEN
Access		R/W			R/W	R/W	R/W	
Reset		0			0	0	0	0

#### Bit 6 – DRVSTR: Output Driver Strength Selection

This bit controls the output driver strength of an I/O pin configured as an output.

Value	Description
0	Pin drive strength is set to normal drive strength.
1	Pin drive strength is set to stronger drive strength.

#### Bit 2 – PULLEN: Pull Enable

This bit enables the internal pull-up or pull-down resistor of an I/O pin configured as an input.

Value	Description
0	Internal pull resistor is disabled, and the input is in a high-impedance configuration.
1	Internal pull resistor is enabled, and the input is driven to a defined logic level in the absence of external input.

#### Bit 1 – INEN: Input Enable

This bit controls the input buffer of an I/O pin configured as either an input or output.

Writing a zero to this bit disables the input buffer completely, preventing read-back of the physical pin state when the pin is configured as either an input or output.

Value	Description
0	Input buffer for the I/O pin is disabled, and the input value will not be sampled.
1	Input buffer for the I/O pin is enabled, and the input value will be sampled when required.

#### Bit 0 – PMUXEN: Peripheral Multiplexer Enable

This bit enables or disables the peripheral multiplexer selection set in the Peripheral Multiplexing register (PMUX<sub>n</sub>) to enable or disable alternative peripheral control over an I/O pin direction and output drive value.

Writing a zero to this bit allows the PORT to control the pad direction via the Data Direction register (DIR) and output drive value via the Data Output Value register (OUT). The peripheral multiplexer value in PMUX<sub>n</sub> is ignored. Writing '1' to this bit enables the peripheral selection in PMUX<sub>n</sub> to control the pad. In this configuration, the physical pin state may still be read from the Data Input Value register (IN) if PINCFG<sub>n</sub>.INEN is set.

Value	Description
0	The peripheral multiplexer selection is disabled, and the PORT registers control the direction and output drive value.
1	The peripheral multiplexer selection is enabled, and the selected peripheral function controls the direction and output drive value.

## 23. EVSYS – Event System

### 23.1. Overview

The Event System (EVSYS) allows autonomous, low-latency and configurable communication between peripherals.

Several peripherals can be configured to generate and/or respond to signals known as events. The exact condition to generate an event, or the action taken upon receiving an event, is specific to each peripheral. Peripherals that respond to events are called event users. Peripherals that generate events are called event generators. A peripheral can have one or more event generators and can have one or more event users.

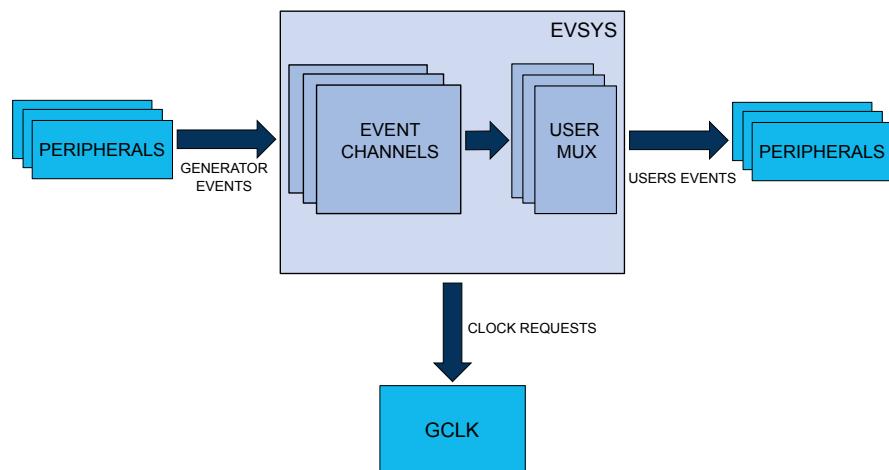

Communication is made without CPU intervention and without consuming system resources such as bus or RAM bandwidth. This reduces the load on the CPU and other system resources, compared to a traditional interrupt-based system.

### 23.2. Features

- 8 configurable event channels, where each channel can:
  - Be connected to any event generator.
  - Provide a pure asynchronous, resynchronized or synchronous path
- 59 event generators.
- 14 event users.
- Configurable edge detector.
- Peripherals can be event generators, event users, or both.
- SleepWalking and interrupt for operation in sleep modes.
- Software event generation.
- Each event user can choose which channel to respond to.

### 23.3. Block Diagram

Figure 23-1. Event System Block Diagram

## 23.4. Signal Description

Not applicable.

## 23.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly, as described below.

### 23.5.1. I/O Lines

Not applicable.

### 23.5.2. Power Management

The EVSYS can be used to wake up the CPU from all sleep modes, even if the clock used by the EVSYS channel and the EVSYS bus clock are disabled. Refer to the *PM – Power Manager* for details on the different sleep modes.

In all sleep modes, although the clock for the EVSYS is stopped, the device still can wake up the EVSYS clock. Some event generators can generate an event when their clocks are stopped.

#### Related Links

[PM – Power Manager](#) on page 129

### 23.5.3. Clocks

The EVSYS bus clock (CLK\_EVSYST\_APB) can be enabled and disabled in the Main Clock module, and the default state of CLK\_EVSYST\_APB can be found in *Peripheral Clock Masking*.

Each EVSYS channel has a dedicated generic clock (GCLK\_EVSYST\_CHANNEL\_n). These are used for event detection and propagation for each channel. These clocks must be configured and enabled in the generic clock controller before using the EVSYS. Refer to *GCLK - Generic Clock Controller* for details.

#### Related Links

[GCLK - Generic Clock Controller](#) on page 108

### 23.5.4. Interrupts

The interrupt request line is connected to the Interrupt Controller. Using the EVSYS interrupts requires the interrupt controller to be configured first. Refer to *Nested Vector Interrupt Controller* for details.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 23.5.5. Events

Not applicable.

### 23.5.6. Debug Operation

When the CPU is halted in debug mode, this peripheral will continue normal operation. If the peripheral is configured to require periodical service by the CPU through interrupts or similar, improper operation or data loss may result during debugging. This peripheral can be forced to halt operation during debugging.

### 23.5.7. Register Access Protection

Registers with write-access can be optionally write-protected by the Peripheral Access Controller (PAC), except the following:

- Interrupt Flag Status and Clear register (INTFLAG)

**Note:** Optional write-protection is indicated by the "PAC Write-Protection" property in the register description.

When the CPU is halted in debug mode, all write-protection is automatically disabled. Write-protection does not apply for accesses through an external debugger.

#### Related Links

[PAC - Peripheral Access Controller](#) on page 45

### 23.5.8. Analog Connections

Not applicable.

## 23.6. Functional Description

### 23.6.1. Principle of Operation

The Event System consists of several channels which route the internal events from peripherals (generators) to other internal peripherals or IO pins (users). Each event generator can be selected as source for multiple channels, but a channel cannot be set to use multiple event generators at the same time.

### 23.6.2. Basic Operation

#### 23.6.2.1. Initialization

Before enabling events routing within the system, the User Multiplexer (USER) and Channel (CHANNEL) register must be configured. The User Multiplexer (USER) must be configured first.

Configure the User Multiplexer (USER) register:

1. The channel to be connected to a user is written to the Channel bit group (USER.CHANNEL)
2. The user to connect the channel is written to the User bit group (USER.USER)

Configure the Channel (CHANNEL) register:

1. The channel to be configured is written to the Channel Selection bit group (CHANNEL.CHANNEL)
2. The path to be used is written to the Path Selection bit group (CHANNEL.PATH)
3. The type of edge detection to use on the channel is written to the Edge Selection bit group (CHANNEL.EDGESEL)
4. The event generator to be used is written to the Event Generator bit group (CHANNEL.EVGEN)

#### 23.6.2.2. Enabling, Disabling and Resetting

The EVSYS is always enabled.

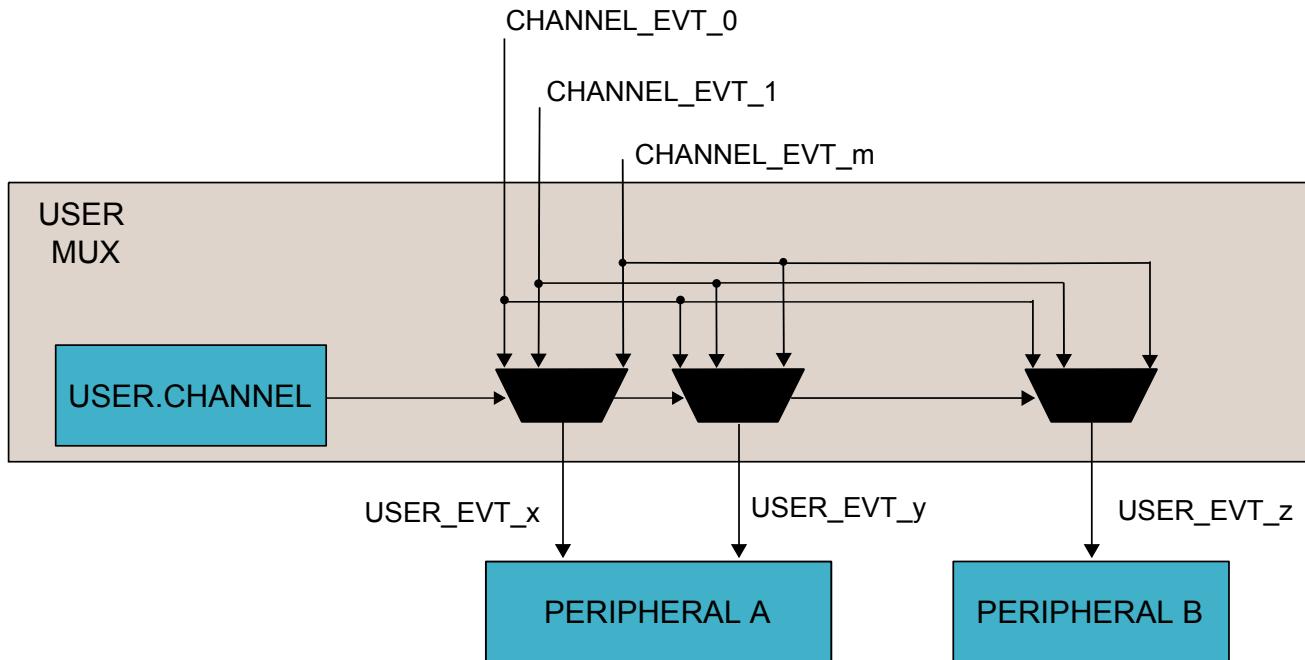

The EVSYS is reset by writing a '1' to the Software Reset bit in the Control register (CTRL.SWRST). All registers in the EVSYS will be reset to their initial state and all ongoing events will be canceled. Refer to CTRL.SWRST register for details.

#### 23.6.2.3. User Multiplexer Setup

The user multiplexer defines the channel to be connected to which event user. Each user multiplexer is dedicated to one event user. A user multiplexer receives all event channels output and must be configured to select one of these channels, as shown in the next figure. The channel is selected with the Channel bit group in the USER register (USER.CHANNEL). The user multiplexer must always be configured before the channel. A full list of selectable users can be found in the User Multiplexer register (USER) description. Refer to UserList for details.

To configure a user multiplexer, the USER register must be written in a single 16-bit write. It is possible to read out the configuration of a user by first selecting the user by writing to USER.USER using an 8-bit write and then performing a read of the 16-bit USER register.

**Figure 23-2. User MUX**

#### 23.6.2.4. Channel Setup

An event channel can select one event from a list of event generators. Depending on configuration, the selected event could be synchronized, resynchronized or asynchronously sent to the users. When synchronization or resynchronization is required, the channel includes an internal edge detector, allowing the Event System to generate internal events when rising, falling or both edges are detected on the selected event generator. An event channel is able to generate internal events for the specific software commands. All these configurations are available in the Channel register (CHANNEL).

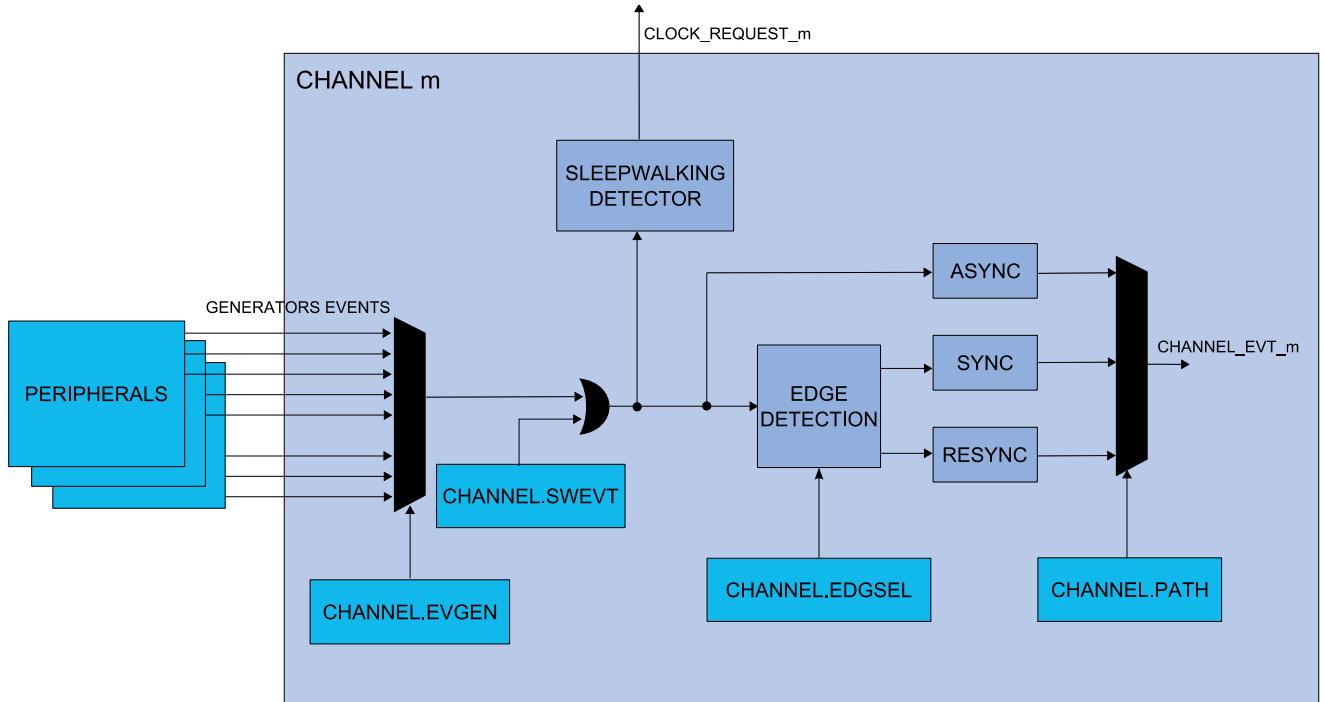

To configure a channel, the Channel register must be written in a single 32-bit write. It is possible to read out the configuration of a channel by first selecting the channel by writing to CHANNEL.CHANNEL using a, 8-bit write, and then performing a read of the CHANNEL register.

#### 23.6.2.5. Channel Path

There are three different ways to propagate the event provided by an event generator:

- Asynchronous path
- Synchronous path
- Resynchronized path

**Figure 23-3. Channel**

The path is selected by writing to the Path Selection bit group in the Channel register (CHANNEL.PATH).

#### Asynchronous Path

When using the asynchronous path, the events are propagated from the event generator to the event user without intervention from the Event System. The GCLK for this channel (GCLK\_EVSYS\_CHANNEL\_n) is not mandatory, meaning that an event will be propagated to the user without any clock latency.

When the asynchronous path is selected, the channel cannot generate any interrupts, and the Channel Status register (CHSTATUS) is always zero. No edge detection is available; this must be handled in the event user. When the event generator and the event user share the same generic clock, using the asynchronous path will propagate the event with the least amount of latency.

#### Synchronous Path

The synchronous path should be used when the event generator and the event channel share the same generator for the generic clock and also if event user supports synchronous path. If event user doesn't support synchronous path, asynchronous path has to be selected. If they do not share the same clock, a logic change from the event generator to the event channel might not be detected in the channel, which means that the event will not be propagated to the event user. For details on generic clock generators, refer to *GCLK - Generic Clock Controller*.

When using the synchronous path, the channel is able to generate interrupts. The channel status bits in the Channel Status register (CHSTATUS) are also updated and available for use.

If the Generic Clocks Request bit in the Control register (CTRL.GCLKREQ) is zero, the channel operates in SleepWalking mode and request the configured generic clock only when an event is to be propagated through the channel. If CTRL.GCLKREQ is one, the generic clock will always be on for the configured channel.

#### Related Links

[GCLK - Generic Clock Controller](#) on page 108

### **Resynchronized Path**

The resynchronized path should be used when the event generator and the event channel do not share the same generic clock generator. When the resynchronized path is used, resynchronization of the event from the event generator is done in the channel. For details on generic clock generators, refer to *GCLK - Generic Clock Controller*.

When the resynchronized path is used, the channel is able to generate interrupts. The channel status bits in the Channel Status register (CHSTATUS) are also updated and available for use.

If the Generic Clocks Request bit in the Control register is zero (CTRL.GCLKREQ=0), the channel operates in SleepWalking mode and request the configured generic clock only when an event is to be propagated through the channel. If CTRL.GCLKREQ=1 , the generic clock will always be on for the configured channel.

### **Related Links**

[GCLK - Generic Clock Controller](#) on page 108

#### **23.6.2.6. Edge Detection**

When synchronous or resynchronized paths are used, edge detection must be used. The event system can perform edge detection in three different ways:

- Generate an event only on the rising edge
- Generate an event only on the falling edge
- Generate an event on rising and falling edges

Edge detection is selected by writing to the Edge Selection bit group in the Channel register (CHANNEL.EDGSEL).

If the generator event is a pulse, both edges cannot be selected. Use the rising edge or falling edge detection methods, depending on the generator event default level.

#### **23.6.2.7. Event Generators**

Each event channel can receive the events form all event generators. All event generators are listed in the statement of CHANNEL.EVGEN. For details on event generation, refer to the corresponding module chapter. The channel event generator is selected by the Event Generator bit group in the Channel register (CHANNEL.EVGEN). By default, the channels are not connected to any event generators (ie, CHANNEL.EVGEN = 0)

#### **23.6.2.8. Channel Status**

The Channel Status register (CHSTATUS) shows the status of the channels when using a synchronous or resynchronized path. There are two different status bits in CHSTATUS for each of the available channels:

- The CHSTATUS.CHBUSY $n$  bit will be set when an event on the corresponding channel  $n$  has not been handled by all event users connected to that channel.
- The CHSTATUS.USRRDY $n$  bit will be set when all event users connected to the corresponding channel are ready to handle incoming events on that channel.

#### **23.6.2.9. Software Event**

A software event can be initiated on a channel by setting the Software Event bit in the Channel register (CHANNEL.SWEVT) to '1' at the same time as writing the Channel bits (CHANNEL.CHANNEL). This will generate a software event on the selected channel.

The software event can be used for application debugging, and functions like any event generator. To use the software event, the event path must be configured to either a synchronous path or resynchronized path (CHANNEL.PATH = 0x0 or 0x1), edge detection must be configured to rising-edge detection (CHANNEL.EDGSEL= 0x1) and the Generic Clock Request bit must be set to '1' (CTRL.GCLKREQ=0x1).

### 23.6.3. Interrupts

The EVSYS has the following interrupt sources:

- Overrun Channel n (OVRn): for details, refer to *The Overrun Channel n Interrupt* section.
- Event Detected Channel n (EVDn): for details, refer to *The Event Detected Channel n Interrupt* section.

These interrupts events are asynchronous wake-up sources. See *Sleep Mode Controller*.

Each interrupt source has an interrupt flag which is in the Interrupt Flag Status and Clear (INTFLAG) register. The flag is set when the interrupt is issued. Each interrupt event can be individually enabled by setting a '1' to the corresponding bit in the Interrupt Enable Set (INTENSET) register, and disabled by setting a '1' to the corresponding bit in the Interrupt Enable Clear (INTENCLR) register. An interrupt event is generated when the interrupt flag is set and the corresponding interrupt is enabled. The interrupt event works until the interrupt flag is cleared, the interrupt is disabled, or the Event System is reset. See INTFLAG for details on how to clear interrupt flags.

All interrupt events from the peripheral are ORed together on system level to generate one combined interrupt request to the NVIC. Refer to the *Nested Vector Interrupt Controller* for details. The event user must read the INTFLAG register to determine what the interrupt condition is.

Note that interrupts must be globally enabled for interrupt requests to be generated. Refer to *Nested Vector Interrupt Controller* for details.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

[Sleep Mode Controller](#) on page 132

#### 23.6.3.1. The Overrun Channel n Interrupt

The Overrun Channel n interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG.OVRn) will be set, and the optional interrupt will be generated in the following cases:

- One or more event users on channel n is not ready when there is a new event.
- An event occurs when the previous event on channel m has not been handled by all event users connected to that channel.

The flag will only be set when using synchronous or resynchronized paths. In the case of asynchronous path, the INTFLAG.OVRn is always read as zero.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

#### 23.6.3.2. The Event Detected Channel n Interrupt

The Event Detected Channel n interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG.EVDn) is set when an event coming from the event generator configured on channel n is detected.

The flag will only be set when using a synchronous or resynchronized paths. In the case of asynchronous path, the INTFLAG.EVDn is always zero.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 23.6.4. Sleep Mode Operation

The EVSYS can generate interrupts to wake up the device from any sleep mode.

Some event generators can generate an event when the system clock is stopped. The generic clock (GCLK\_EVSYS\_CHANNELx) for this channel will be restarted if the channel uses a synchronized path or a resynchronized path, without waking the system from sleep. The clock remains active only as long as necessary to handle the event. After the event has been handled, the clock will be turned off and the system will remain in the original sleep mode. This is known as SleepWalking. When an asynchronous path is used, there is no need for the clock to be activated for the event to be propagated to the user.

On a software reset, all registers are set to their reset values and any ongoing events are canceled.

## 23.7. Register Summary

Offset	Name	Bit Pos.									
0x00	CTRL	7:0				GCLKREQ				SWRST	
0x01	Reserved										
0x03											
0x04			7:0	CHANNEL[7:0]							
0x05	CHANNEL		15:8							SWEVT	
0x06			23:16	EVGEN[7:0]							
0x07			31:24				EDGSEL[1:0]	PATH[1:0]			
0x08			7:0	USER[7:0]							
0x09	USER		15:8	CHANNEL[7:0]							
0x0A			Reserved								
0x0B											
0x0C	CHSTATUS		7:0	USR RDY7	USR RDY6	USR RDY5	USR RDY4	USR RDY3	USR RDY2	USR RDY1	USR RDY0
0x0D			15:8	CH BUSY7	CH BUSY6	CH BUSY5	CH BUSY4	CH BUSY3	CH BUSY2	CH BUSY1	CH BUSY0
0x0E			23:16								
0x0F			31:24								
0x10	INTENCLR		7:0	OVR7	OVR6	OVR5	OVR4	OVR3	OVR2	OVR1	OVR0

0x1B			31:24								

## 23.8. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16-, and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers are enable-protected, meaning they can only be written when the module is disabled. Enable-protection is denoted by the "Enable-Protected" property in each individual register description.

Refer to [Register Access Protection](#).

### 23.8.1. Control

**Name:** CTRL  
**Offset:** 0x00  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
				GCLKREQ				SWRST
Access				R/W				W
Reset				0				0

#### Bit 4 – GCLKREQ: Generic Clock Requests

This bit is used to determine whether the generic clocks used for the different channels should be on all the time or only when an event needs the generic clock. Events propagated through asynchronous paths will not need a generic clock.

Value	Description
0	Generic clock is requested and turned on only if an event is detected.
1	Generic clock for a channel is always on.

#### Bit 0 – SWRST: Software Reset

Writing a zero to this bit has no effect.

Writing a one to this bit resets all registers in the EVSYS to their initial state.

Writing a one to CTRL.SWRST will always take precedence, meaning that all other writes in the same write-operation will be discarded.

**Note:** Before applying a Software Reset it is recommended to disable the event generators.

### 23.8.2. Channel

**Name:** CHANNEL  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Write-Protected

Bit	31	30	29	28	27	26	25	24
					EDGSEL[1:0]		PATH[1:0]	
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	23	22	21	20	19	18	17	16
				EVGEN[7:0]				
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
							SWEVT	
Access								R/W
Reset								0
Bit	7	6	5	4	3	2	1	0
				CHANNEL[7:0]				
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 27:26 – EDGSEL[1:0]: Edge Detection Selection

These bits set the type of edge detection to be used on the channel.

These bits must be written to zero when using the asynchronous path.

EDGSEL[1:0]	Name	Description
0x0	NO_EVT_OUTPUT	No event output when using the resynchronized or synchronous path
0x1	RISING_EDGE	Event detection only on the rising edge of the signal from the event generator when using the resynchronized or synchronous path
0x2	FALLING_EDGE	Event detection only on the falling edge of the signal from the event generator when using the resynchronized or synchronous path
0x3	BOTH_EDGES	Event detection on rising and falling edges of the signal from the event generator when using the resynchronized or synchronous path

#### Bits 25:24 – PATH[1:0]: Path Selection

These bits are used to choose the path to be used by the selected channel.

The path choice can be limited by the channel source.

PATH[1:0]	Name	Description
0x0	SYNCHRONOUS	Synchronous path
0x1	RESYNCHRONIZED	Resynchronized path
0x2	ASYNCHRONOUS	Asynchronous path
0x3	-	Reserved

#### Bits 23:16 – EVGEN[7:0]: Event Generator Selection

These bits are used to choose which event generator to connect to the selected channel.

Value	Event Generator	Description
0x00	NONE	No event generator selected
0x01	RTC CMP0	Compare 0 (mode 0 and 1) or Alarm 0 (mode 2)
0x02	RTC CMP1	Compare 1
0x03	RTC OVF	Overflow
0x04	RTC PER0	Period 0
0x05	RTC PER1	Period 1
0x06	RTC PER2	Period 2
0x07	RTC PER3	Period 3
0x08	RTC PER4	Period 4
0x09	RTC PER5	Period 5
0x0A	RTC PER6	Period 6
0x0B	RTC PER7	Period 7
0x0C	EIC EXTINT0	External Interrupt 0
0x0D	EIC EXTINT1	External Interrupt 1
0x0E	EIC EXTINT2	External Interrupt 2
0x0F	EIC EXTINT3	External Interrupt 3
0x10	EIC EXTINT4	External Interrupt 4
0x11	EIC EXTINT5	External Interrupt 5
0x12	EIC EXTINT6	External Interrupt 6
0x13	EIC EXTINT7	External Interrupt 7
0x14	EIC EXTINT8	External Interrupt 8
0x15	EIC EXTINT9	External Interrupt 9
0x16	EIC EXTINT10	External Interrupt 10
0x17	EIC EXTINT11	External Interrupt 11
0x18	EIC EXTINT12	External Interrupt 12

<b>Value</b>	<b>Event Generator</b>	<b>Description</b>
0x19	EIC EXTINT13	External Interrupt 13
0x1A	EIC EXTINT14	External Interrupt 14
0x1B	EIC EXTINT15	External Interrupt 15
0x1C	TC0 OVF	Overflow/Underflow
0x1D	TC0 MC0	Match/Capture 0
0x1E	TC0 MC1	Match/Capture 1
0x1F	TC1 OVF	Overflow/Underflow
0x20	TC1 MC0	Match/Capture 0
0x21	TC1 MC1	Match/Capture 1
0x22	TC2 OVF	Overflow/Underflow
0x23	TC2 MC0	Match/Capture 0
0x24	TC2 MC1	Match/Capture 1
0x25	TC3 OVF	Overflow/Underflow
0x26	TC3 MC0	Match/Capture 0
0x27	TC3 MC1	Match/Capture 1
0x28	TC4 OVF	Overflow/Underflow
0x29	TC4 MC0	Match/Capture 0
0x2A	TC4 MC1	Match/Capture 1
0x2B	TC5 OVF	Overflow/Underflow
0x2C	TC5 MC0	Match/Capture 0
0x2D	TC5 MC1	Match/Capture 1
0x2E	TC6 OVF	Overflow/Underflow
0x2F	TC6 MC0	Match/Capture 0
0x30	TC6 MC1	Match/Capture 1
0x31	TC7 OVF	Overflow/Underflow
0x32	TC7 MC0	Match/Capture 0
0x33	TC7 MC1	Match/Capture 1
0x34	ADC RESRDY	Result Ready
0x35	ADC WINMON	Window Monitor
0x36	AC COMP0	Comparator 0
0x37	AC COMP1	Comparator 1
0x38	AC WIN0	Window 0
0x39	DAC EMPTY	Data Buffer Empty

Value	Event Generator	Description
0x3A	PTC EOC	End of Conversion
0x3B	PTC WCOMP	Window Comparator
0x3C-0x7F	Reserved	-

#### Bit 8 – SWEVT: Software Event

This bit is used to insert a software event on the channel selected by the CHANNEL.CHANNEL bit group.

This bit has the same behavior similar to an event.

This bit must be written together with CHANNEL.CHANNEL using a 16-bit write.

Writing a zero to this bit has no effect.

Writing a one to this bit will trigger a software event for the corresponding channel.

This bit will always return zero when read.

#### Bits 7:0 – CHANNEL[7:0]: Channel Selection

These bits are used to select the channel to be set up or read from.

Value	Channel number
0x00	0
0x01	1
0x02	2
0x03	3
0x04	4
0x05	5
0x06	6
0x07	7
0x08-0xFF	Reserved

### 23.8.3. User Multiplexer

**Name:** USER  
**Offset:** 0x08  
**Reset:** 0x0000  
**Property:** Write-Protected

Bit	15	14	13	12	11	10	9	8
CHANNEL[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
USER[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 15:8 – CHANNEL[7:0]: Channel Event Selection

These bits are used to select the channel to connect to the event user.

Note that to select channel n, the value (n+1) must be written to the USER.CHANNEL bit group.

CHANNEL[7:0]	Channel Number
0x0	No Channel Output Selected
0x1-0x08	Channel n-1 selected
0x09-0xFF	Reserved

#### Bits 7:0 – USER[7:0]: User Multiplexer Selection

These bits select the event user to be configured with a channel, or the event user to read the channel value from.

Table 23-1. User Multiplexer Selection

USER[7:0]	User Multiplexer	Description	Path Type
0x00	TC0		Asynchronous, synchronous and resynchronized paths
0x01	TC1		Asynchronous, synchronous and resynchronized paths
0x02	TC2		Asynchronous, synchronous and resynchronized paths
0x03	TC3		Asynchronous, synchronous and resynchronized paths
0x04	TC4		Asynchronous, synchronous and resynchronized paths
0x05	TC5		Asynchronous, synchronous and resynchronized paths

<b>USER[7:0]</b>	<b>User Multiplexer</b>	<b>Description</b>	<b>Path Type</b>
0x06	TC6		Asynchronous, synchronous and resynchronized paths
0x07	TC7		Asynchronous, synchronous and resynchronized paths
0x08	ADC START	ADC start conversion	Asynchronous path only
0x09	ADC SYNC	Flush ADC	Asynchronous path only
0x0A	AC COMP0	Start comparator 0	Asynchronous path only
0x0B	AC COMP1	Start comparator 1	Asynchronous path only
0x0C	DAC START	DAC start conversion	Asynchronous path only
0x0D	PTC STCONV	PTC start conversion	Asynchronous path only
0x0E-0xFF	Reserved	-	Reserved

### 23.8.4. Channel Status

**Name:** CHSTATUS

**Offset:** 0x0C

#### Bits 15,14,13,12,11,10,9,8 – CHBUSYn : Channel n Busy [n=7..0]

This bit is cleared when channel n is idle

This bit is set if an event on channel n has not been handled by all event users connected to channel n.

#### Bits 7,6,5,4,3,2,1,0 – USRRDYn : Channel n User Ready [n=7..0]

This bit is cleared when at least one of the event users connected to the channel is not ready.

This bit is set when all event users connected to channel n are ready to handle incoming events on channel n.

### 23.8.5. Interrupt Enable Clear

**Name:** INTENCLR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Write-Protected

Reset 0 0 0 0 0 0 0 0 0

#### Bits 15,14,13,12,11,10,9,8 – EVDn : Channel n Event Detection [n=7..0]

This flag is set on the next CLK\_EVSYS\_APB cycle when an event is being propagated through the channel, and an interrupt request will be generated if INTENCLR/SET.EVDn is one.

When the event channel path is asynchronous, the EVDn interrupt flag will not be set.

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Event Detected Channel n interrupt flag.

#### Bits 7,6,5,4,3,2,1,0 – OVRn : Channel n Overrun [n=7..0]

This flag is set on the next CLK\_EVSYS cycle after an overrun channel condition occurs, and an interrupt request will be generated if INTENCLR/SET.OVRn is one.

When the event channel path is asynchronous, the OVRn interrupt flag will not be set.

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Overrun Channel n interrupt flag.

## 24. SERCOM – Serial Communication Interface

### 24.1. Overview

There are up to five instances of the serial communication interface (SERCOM) peripheral.

A SERCOM can be configured to support a number of modes: I<sup>2</sup>C, SPI, and USART. When SERCOM is configured and enabled, all SERCOM resources will be dedicated to the selected mode.

The SERCOM serial engine consists of a transmitter and receiver, baud-rate generator and address matching functionality. It can use the internal generic clock or an external clock to operate in all sleep modes.

#### Related Links

[SERCOM SPI – SERCOM Serial Peripheral Interface](#) on page 405

[SERCOM I<sup>2</sup>C – SERCOM Inter-Integrated Circuit](#) on page 431

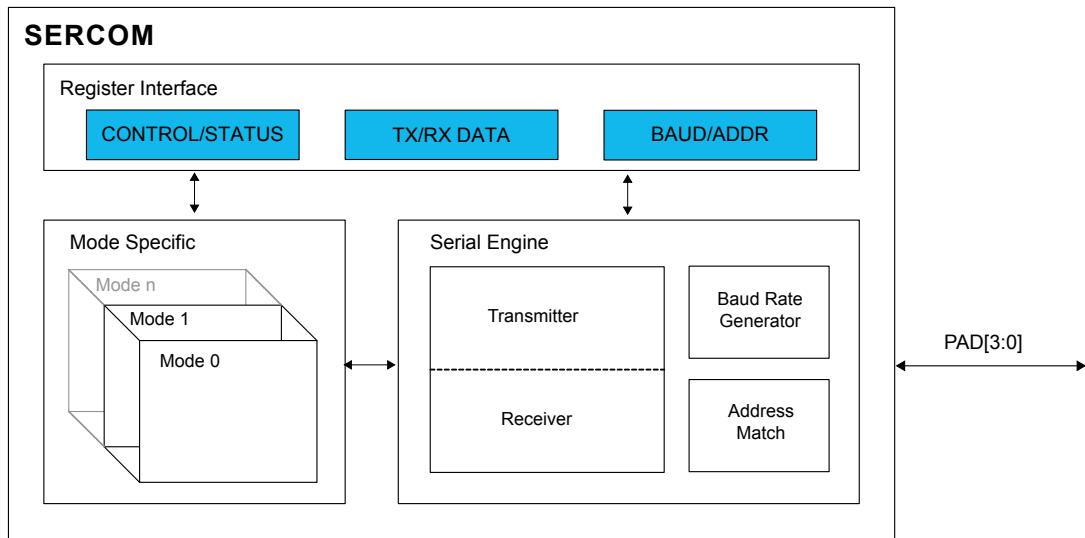

### 24.2. Features

- Interface for configuring into one of the following:
  - I<sup>2</sup>C – Two-wire serial interface  
SMBus™ compatible
  - SPI – Serial peripheral interface
  - USART – Universal synchronous and asynchronous serial receiver and transmitter
- Single transmit buffer and double receive buffer
- Baud-rate generator
- Address match/mask logic
- Operational in all sleep modes

See the Related Links for full feature lists of the interface configurations.

### 24.3. Block Diagram

Figure 24-1. SERCOM Block Diagram

### 24.4. Signal Description

See the respective SERCOM mode chapters for details.

#### Related Links

- [SERCOM USART – SERCOM Universal Synchronous and Asynchronous Receiver and Transmitter](#) on page 377
- [SERCOM SPI – SERCOM Serial Peripheral Interface](#) on page 405
- [SERCOM I2C – SERCOM Inter-Integrated Circuit](#) on page 431

### 24.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly, as described below.

#### 24.5.1. I/O Lines

Using the SERCOM I/O lines requires the I/O pins to be configured using port configuration (PORT).

From *USART Block Diagram* one can see that the SERCOM has four internal pads, PAD[3:0]. The signals from I2C, SPI and USART are routed through these SERCOM pads via a multiplexer. The configuration of the multiplexer is available from the different SERCOM modes. Refer to the mode specific chapters for details.

#### Related Links

- [SERCOM USART – SERCOM Universal Synchronous and Asynchronous Receiver and Transmitter](#) on page 377
- [SERCOM SPI – SERCOM Serial Peripheral Interface](#) on page 405
- [SERCOM I2C – SERCOM Inter-Integrated Circuit](#) on page 431
- [PORT: IO Pin Controller](#) on page 320
- [Block Diagram](#) on page 378

#### 24.5.2. Power Management

The SERCOM can operate in any sleep mode where the selected clock source is running. SERCOM interrupts can be used to wake up the device from sleep modes.

## Related Links

[PM – Power Manager](#) on page 129

### 24.5.3. Clocks

The SERCOM bus clock (CLK\_SERCOMx\_APB) is enabled by default, and can be enabled and disabled in the Power Manager.

The SERCOM uses two generic clocks: GCLK\_SERCOMx\_CORE and GCLK\_SERCOMx\_SLOW. The core clock (GCLK\_SERCOMx\_CORE) is required to clock the SERCOM while working as a master. The slow clock (GCLK\_SERCOMx\_SLOW) is only required for certain functions. See specific mode chapters for details.

These clocks must be configured and enabled in the Generic Clock Controller (GCLK) before using the SERCOM.

The generic clocks are asynchronous to the user interface clock (CLK\_SERCOMx\_APB). Due to this asynchronicity, writing to certain registers will require synchronization between the clock domains. Refer to [Synchronization](#) for details.

## Related Links

[GCLK - Generic Clock Controller](#) on page 108

### 24.5.4. Interrupts

The interrupt request line is connected to the Interrupt Controller (NVIC). The NVIC must be configured before the SERCOM interrupts are used.

## Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 24.5.5. Events

Not applicable.

### 24.5.6. Debug Operation

When the CPU is halted in debug mode, this peripheral will continue normal operation. If the peripheral is configured to require periodical service by the CPU through interrupts or similar, improper operation or data loss may result during debugging. This peripheral can be forced to halt operation during debugging - refer to the Debug Control (DBGCTRL) register for details.

### 24.5.7. Register Access Protection

All registers with write-access can be write-protected optionally by the Peripheral Access Controller (PAC), except the following registers:

- Interrupt Flag Clear and Status register (INTFLAG)
- Status register (STATUS)
- Data register (DATA)
- Address register (ADDR)

Optional write-protection by the Peripheral Access Controller (PAC) is denoted by the "PAC Write-Protection" property in each individual register description.

PAC write-protection does not apply to accesses through an external debugger.

## Related Links

[PAC - Peripheral Access Controller](#) on page 45

#### 24.5.8. Analog Connections

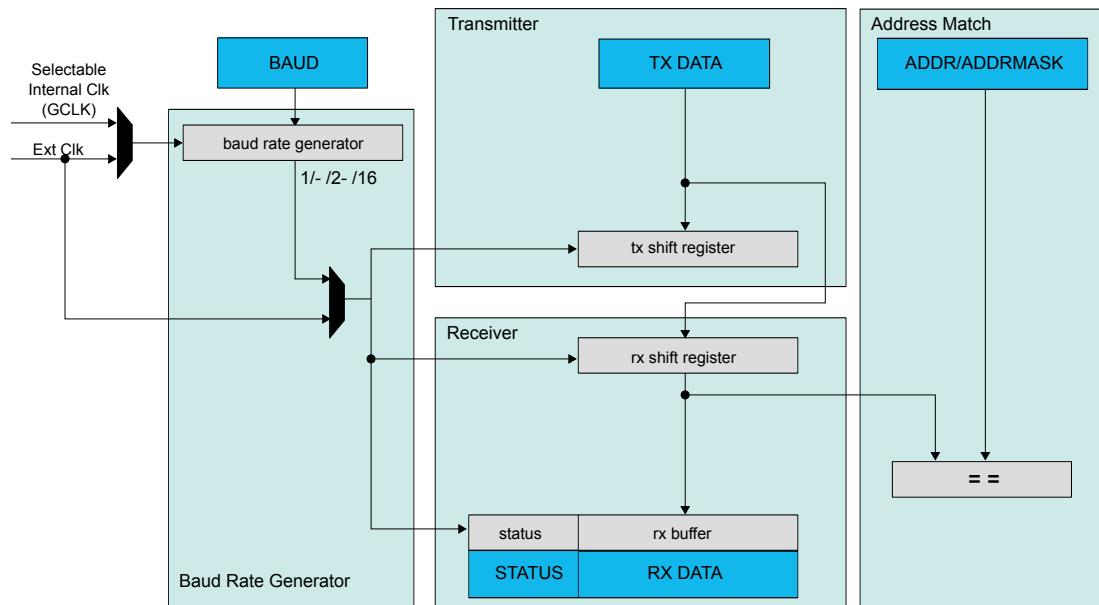

Not applicable.

### 24.6. Functional Description

#### 24.6.1. Principle of Operation

The basic structure of the SERCOM serial engine is shown in [Figure 24-2](#). Labels in capital letters are synchronous to the system clock and accessible by the CPU; labels in lowercase letters can be configured to run on the GCLK\_SERCOMx\_CORE clock or an external clock.

**Figure 24-2. SERCOM Serial Engine**

The transmitter consists of a single write buffer and a shift register.

The receiver consists of a two-level receive buffer and a shift register.

The baud-rate generator is capable of running on the GCLK\_SERCOMx\_CORE clock or an external clock.

Address matching logic is included for SPI and I<sup>2</sup>C operation.

#### 24.6.2. Basic Operation

##### 24.6.2.1. Initialization

The SERCOM must be configured to the desired mode by writing the Operating Mode bits in the Control A register (CTRLA.MODE). Refer to table SERCOM Modes for details.

**Table 24-1. SERCOM Modes**

CTRLA.MODE	Description
0x0	USART with external clock
0x1	USART with internal clock
0x2	SPI in slave operation

CTRLA.MODE	Description
0x3	SPI in master operation
0x4	I <sup>2</sup> C slave operation
0x5	I <sup>2</sup> C master operation
0x6-0x7	Reserved

For further initialization information, see the respective SERCOM mode chapters:

#### Related Links

[SERCOM USART – SERCOM Universal Synchronous and Asynchronous Receiver and Transmitter](#) on page 377

[SERCOM SPI – SERCOM Serial Peripheral Interface](#) on page 405

[SERCOM I<sup>2</sup>C – SERCOM Inter-Integrated Circuit](#) on page 431

#### 24.6.2.2. Enabling, Disabling, and Resetting

This peripheral is enabled by writing '1' to the Enable bit in the Control A register (CTRLA.ENABLE), and disabled by writing '0' to it.

Writing '1' to the Software Reset bit in the Control A register (CTRLA.SWRST) will reset all registers of this peripheral to their initial states, except the DBGCTRL register, and the peripheral is disabled.

Refer to the CTRLA register description for details.

#### 24.6.2.3. Clock Generation – Baud-Rate Generator

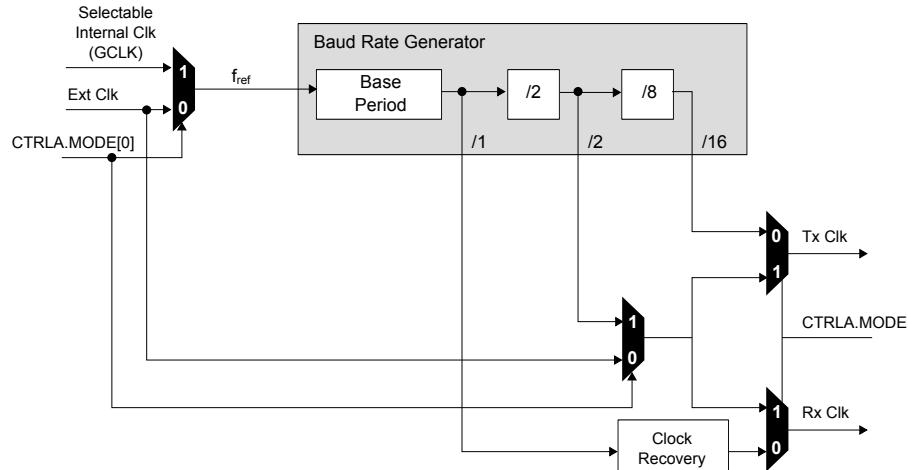

The baud-rate generator, as shown in [Figure 24-3](#), generates internal clocks for asynchronous and synchronous communication. The output frequency ( $f_{BAUD}$ ) is determined by the Baud register (BAUD) setting and the baud reference frequency ( $f_{ref}$ ). The baud reference clock is the serial engine clock, and it can be internal or external.

For asynchronous communication, the /16 (divide-by-16) output is used when transmitting, whereas the /1 (divide-by-1) output is used while receiving.

For synchronous communication, the /2 (divide-by-2) output is used.

This functionality is automatically configured, depending on the selected operating mode.

**Figure 24-3. Baud Rate Generator**

[Table 24-2](#) contains equations for the baud rate (in bits per second) and the BAUD register value for each operating mode.

For asynchronous operation, there are two different modes: In *arithmetic mode*, the BAUD register value is 16 bits (0 to 65,535). In *fractional mode*, the BAUD register is 13 bits, while the fractional adjustment is 3 bits. In this mode the BAUD setting must be greater than or equal to 1.

For synchronous operation, the BAUD register value is 8 bits (0 to 255).

**Table 24-2. Baud Rate Equations**

Operating Mode	Condition	Baud Rate (Bits Per Second)	BAUD Register Value Calculation
Asynchronous Arithmetic	$f_{BAUD} \leq \frac{f_{ref}}{S}$	$f_{BAUD} = \frac{f_{ref}}{S} \left(1 - \frac{BAUD}{65536}\right)$	$BAUD = 65536 \cdot \left(1 - S \cdot \frac{f_{BAUD}}{f_{ref}}\right)$
Asynchronous Fractional	$f_{BAUD} \leq \frac{f_{ref}}{S}$	$f_{BAUD} = \frac{f_{ref}}{S \cdot \left(BAUD + \frac{FP}{8}\right)}$	$BAUD = \frac{f_{ref}}{S \cdot f_{BAUD}} - \frac{FP}{8}$
Synchronous	$f_{BAUD} \leq \frac{f_{ref}}{2}$	$f_{BAUD} = \frac{f_{ref}}{2 \cdot (BAUD + 1)}$	$BAUD = \frac{f_{ref}}{2 \cdot f_{BAUD}} - 1$

S - Number of samples per bit. Can be 16, 8, or 3.

The Asynchronous Fractional option is used for auto-baud detection.

The baud rate error is represented by the following formula:

$$\text{Error} = 1 - \left( \frac{\text{ExpectedBaudRate}}{\text{ActualBaudRate}} \right)$$

#### Asynchronous Arithmetic Mode BAUD Value Selection

The formula given for  $f_{BAUD}$  calculates the average frequency over 65536  $f_{ref}$  cycles. Although the BAUD register can be set to any value between 0 and 65536, the actual average frequency of  $f_{BAUD}$  over a single frame is more granular. The BAUD register values that will affect the average frequency over a single frame lead to an integer increase in the cycles per frame (CPF)

$$CPF = \frac{f_{ref}}{f_{BAUD}}(D + S)$$

where

- D represent the data bits per frame
- S represent the sum of start and first stop bits, if present.

**Table 24-3** shows the BAUD register value versus baud frequency  $f_{BAUD}$  at a serial engine frequency of 48MHz. This assumes a D value of 8 bits and an S value of 2 bits (10 bits, including start and stop bits).

**Table 24-3. BAUD Register Value vs. Baud Frequency**

BAUD Register Value	Serial Engine CPF	$f_{BAUD}$ at 48MHz Serial Engine Frequency ( $f_{REF}$ )
0 – 406	160	3MHz
407 – 808	161	2.981MHz
809 – 1205	162	2.963MHz
...	...	...
65206	31775	15.11kHz

BAUD Register Value	Serial Engine CPF	$f_{BAUD}$ at 48MHz Serial Engine Frequency ( $f_{REF}$ )
65207	31871	15.06kHz
65208	31969	15.01kHz

### 24.6.3. Additional Features

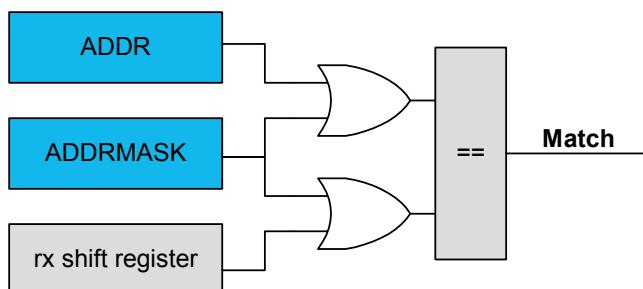

#### 24.6.3.1. Address Match and Mask

The SERCOM address match and mask feature is capable of matching either one address, two unique addresses, or a range of addresses with a mask, based on the mode selected. The match uses seven or eight bits, depending on the mode.

##### Address With Mask

An address written to the Address bits in the Address register (ADDR.ADDR), and a mask written to the Address Mask bits in the Address register (ADDR.ADDRMASK) will yield an address match. All bits that are masked are not included in the match. Note that writing the ADDR.ADDRMASK to 'all zeros' will match a single unique address, while writing ADDR.ADDRMASK to 'all ones' will result in all addresses being accepted.

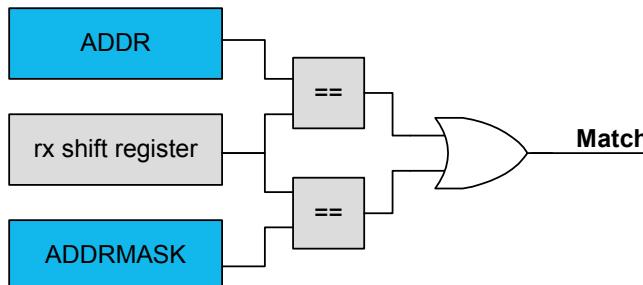

Figure 24-4. Address With Mask

##### Two Unique Addresses

The two addresses written to ADDR and ADDRMASK will cause a match.

Figure 24-5. Two Unique Addresses

##### Address Range

The range of addresses between and including ADDR.ADDR and ADDR.ADDRMASK will cause a match. ADDR.ADDR and ADDR.ADDRMASK can be set to any two addresses, with ADDR.ADDR acting as the upper limit and ADDR.ADDRMASK acting as the lower limit.

Figure 24-6. Address Range

### 24.6.4. Interrupts

Interrupt sources are mode-specific. See the respective SERCOM mode chapters for details.

Each interrupt source has its own interrupt flag.

The interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG) will be set when the interrupt condition is met.

Each interrupt can be individually enabled by writing '1' to the corresponding bit in the Interrupt Enable Set register (INTENSET), and disabled by writing '1' to the corresponding bit in the Interrupt Enable Clear register (INTENCLR).

An interrupt request is generated when the interrupt flag is set and the corresponding interrupt is enabled. The interrupt request remains active until either the interrupt flag is cleared, the interrupt is disabled, or the SERCOM is reset. For details on clearing interrupt flags, refer to the INTFLAG register description.

The SERCOM has one common interrupt request line for all the interrupt sources. The value of INTFLAG indicates which interrupt condition occurred. The user must read the INTFLAG register to determine which interrupt condition is present.

**Note:**

Note that interrupts must be globally enabled for interrupt requests.

**Related Links**

[Nested Vector Interrupt Controller](#) on page 41

#### **24.6.5. Events**

Not applicable.

#### **24.6.6. Sleep Mode Operation**

The peripheral can operate in any sleep mode where the selected serial clock is running. This clock can be external or generated by the internal baud-rate generator.

The SERCOM interrupts can be used to wake up the device from sleep modes. Refer to the different SERCOM mode chapters for details.

#### **24.6.7. Synchronization**

Due to asynchronicity between the main clock domain and the peripheral clock domains, some registers need to be synchronized when written or read.

Required write-synchronization is denoted by the "Write-Synchronized" property in the register description.

Required read-synchronization is denoted by the "Read-Synchronized" property in the register description.

**Related Links**

[Register Synchronization](#) on page 101

## 25. SERCOM USART – SERCOM Universal Synchronous and Asynchronous Receiver and Transmitter

### 25.1. Overview

The Universal Synchronous and Asynchronous Receiver and Transmitter (USART) is one of the available modes in the Serial Communication Interface (SERCOM).

The USART uses the SERCOM transmitter and receiver, see [Block Diagram](#). Labels in uppercase letters are synchronous to CLK\_SERCOMx\_APB and accessible for CPU. Labels in lowercase letters can be programmed to run on the internal generic clock or an external clock.

The transmitter consists of a single write buffer, a shift register, and control logic for different frame formats. The write buffer support data transmission without any delay between frames. The receiver consists of a two-level receive buffer and a shift register. Status information of the received data is available for error checking. Data and clock recovery units ensure robust synchronization and noise filtering during asynchronous data reception.

#### Related Links

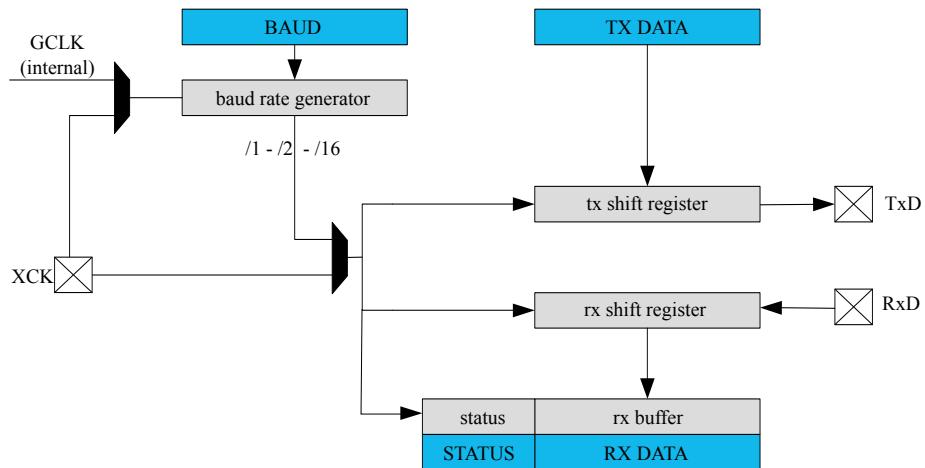

[SERCOM – Serial Communication Interface](#) on page 369

### 25.2. USART Features

- Full-duplex operation
- Asynchronous (with clock reconstruction) or synchronous operation
- Internal or external clock source for asynchronous and synchronous operation
- Baud-rate generator
- Supports serial frames with 5, 6, 7, 8 or 9 data bits and 1 or 2 stop bits
- Odd or even parity generation and parity check
- Selectable LSB- or MSB-first data transfer
- Buffer overflow and frame error detection
- Noise filtering, including false start-bit detection and digital low-pass filter
- Can operate in all sleep modes
- Operation at speeds up to half the system clock for internally generated clocks
- Operation at speeds up to the system clock for externally generated clocks
- Start-of-frame detection

## 25.3. Block Diagram

Figure 25-1. USART Block Diagram

## 25.4. Signal Description

Table 25-1. SERCOM USART Signals

Signal Name	Type	Description
PAD[3:0]	Digital I/O	General SERCOM pins

One signal can be mapped to one of several pins.

### Related Links

[I/O Multiplexing and Considerations](#) on page 27

## 25.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly, as described below.

### 25.5.1. I/O Lines

Using the USART's I/O lines requires the I/O pins to be configured using the I/O Pin Controller (PORT).

When the SERCOM is used in USART mode, the SERCOM controls the direction and value of the I/O pins according to the table below. Both PORT control bits PINCFGn.PULLEN and PINCFGn.DRVSTR are still effective. If the receiver or transmitter is disabled, these pins can be used for other purposes.

Table 25-2. USART Pin Configuration

Pin	Pin Configuration
TxD	Output
RxD	Input
XCK	Output or input

The combined configuration of PORT and the Transmit Data Pinout and Receive Data Pinout bit fields in the Control A register (CTRLA.TXPO and CTRLA.RXPO, respectively) will define the physical position of the USART signals in [Table 25-2](#).

## Related Links

[PORT: IO Pin Controller](#) on page 320

### 25.5.2. Power Management

This peripheral can continue to operate in any sleep mode where its source clock is running. The interrupts can wake up the device from sleep modes.

## Related Links

[PM – Power Manager](#) on page 129

### 25.5.3. Clocks

The SERCOM bus clock (CLK\_SERCOMx\_APB) is enabled by default, and can be disabled and enabled in the Power Manager. Refer to *Peripheral Clock Masking* for details.

A generic clock (GCLK\_SERCOMx\_CORE) is required to clock the SERCOMx\_CORE. This clock must be configured and enabled in the Generic Clock Controller before using the SERCOMx\_CORE. Refer to *GCLK - Generic Clock Controller* for details.

This generic clock is asynchronous to the bus clock (CLK\_SERCOMx\_APB). Therefore, writing to certain registers will require synchronization to the clock domains. Refer to *Synchronization* for further details.

## Related Links

[GCLK - Generic Clock Controller](#) on page 108

[Synchronization](#) on page 376

[Peripheral Clock Masking](#) on page 134

### 25.5.4. Interrupts

The interrupt request line is connected to the Interrupt Controller. In order to use interrupt requests of this peripheral, the Interrupt Controller (NVIC) must be configured first. Refer to *Nested Vector Interrupt Controller* for details.

## Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 25.5.5. Events

Not applicable.

### 25.5.6. Debug Operation

When the CPU is halted in debug mode, this peripheral will continue normal operation. If the peripheral is configured to require periodical service by the CPU through interrupts or similar, improper operation or data loss may result during debugging. This peripheral can be forced to halt operation during debugging - refer to the Debug Control (DBGCTRL) register for details.

## Related Links

[DBGCTRL](#) on page 395

### 25.5.7. Register Access Protection

Registers with write-access can be write-protected optionally by the peripheral access controller (PAC).

PAC Write-Protection is not available for the following registers:

- Interrupt Flag Clear and Status register (INTFLAG)
- Status register (STATUS)

- Data register (DATA)

Optional PAC Write-Protection is denoted by the "PAC Write-Protection" property in each individual register description.

Write-protection does not apply to accesses through an external debugger.

#### Related Links

[PAC - Peripheral Access Controller](#) on page 45

### 25.5.8. Analog Connections

Not applicable.

## 25.6. Functional Description

### 25.6.1. Principle of Operation

The USART uses the following lines for data transfer:

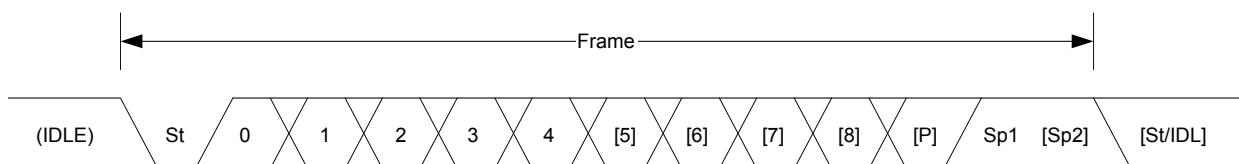

- RxD for receiving
- TxD for transmitting
- XCK for the transmission clock in synchronous operation

USART data transfer is frame based. A serial frame consists of:

- 1 start bit
- From 5 to 9 data bits (MSB or LSB first)
- No, even or odd parity bit
- 1 or 2 stop bits

A frame starts with the start bit followed by one character of data bits. If enabled, the parity bit is inserted after the data bits and before the first stop bit. After the stop bit(s) of a frame, either the next frame can follow immediately, or the communication line can return to the idle (high) state. The figure below illustrates the possible frame formats. Brackets denote optional bits.

**Figure 25-2. Frame Formats**

**St** Start bit. Signal is always low.

**n, [n]** Data bits. 0 to [5..9]

**[P]** Parity bit. Either odd or even.

**Sp, [Sp]** Stop bit. Signal is always high.

**IDLE** No frame is transferred on the communication line. Signal is always high in this state.

## 25.6.2. Basic Operation

### 25.6.2.1. Initialization

The following registers are enable-protected, meaning they can only be written when the USART is disabled (CTRLA.ENABLE=0):

- Control A register (CTRLA), except the Enable (ENABLE) and Software Reset (SWRST) bits.
- Control B register (CTRLB), except the Receiver Enable (RXEN) and Transmitter Enable (TXEN) bits.
- Baud register (BAUD)

When the USART is enabled or is being enabled (CTRLA.ENABLE=1), any writing attempt to these registers will be discarded. If the peripheral is being disabled, writing to these registers will be executed after disabling is completed. Enable-protection is denoted by the "Enable-Protection" property in the register description.

Before the USART is enabled, it must be configured by these steps:

1. Select either external (0x0) or internal clock (0x1) by writing the Operating Mode value in the CTRLA register (CTRLA.MODE).
2. Select either asynchronous (0) or synchronous (1) communication mode by writing the Communication Mode bit in the CTRLA register (CTRLA.CMODE).
3. Select pin for receive data by writing the Receive Data Pinout value in the CTRLA register (CTRLA.RXPO).
4. Select pads for the transmitter and external clock by writing the Transmit Data Pinout bit in the CTRLA register (CTRLA.TXPO).
5. Configure the Character Size field in the CTRLB register (CTRLB.CHSIZE) for character size.
6. Set the Data Order bit in the CTRLA register (CTRLA.DORD) to determine MSB- or LSB-first data transmission.
7. To use parity mode:
  - 7.1. Enable parity mode by writing 0x1 to the Frame Format field in the CTRLA register (CTRLA.FORM).
  - 7.2. Configure the Parity Mode bit in the CTRLB register (CTRLB.PMODE) for even or odd parity.
8. Configure the number of stop bits in the Stop Bit Mode bit in the CTRLB register (CTRLB.SBMODE).
9. When using an internal clock, write the Baud register (BAUD) to generate the desired baud rate.
10. Enable the transmitter and receiver by writing '1' to the Receiver Enable and Transmitter Enable bits in the CTRLB register (CTRLB.RXEN and CTRLB.TXEN).

### 25.6.2.2. Enabling, Disabling, and Resetting

This peripheral is enabled by writing '1' to the Enable bit in the Control A register (CTRLA.ENABLE), and disabled by writing '0' to it.

Writing '1' to the Software Reset bit in the Control A register (CTRLA.SWRST) will reset all registers of this peripheral to their initial states, except the DBGCTRL register, and the peripheral is disabled.

Refer to the CTRLA register description for details.

### 25.6.2.3. Clock Generation and Selection

For both synchronous and asynchronous modes, the clock used for shifting and sampling data can be generated internally by the SERCOM baud-rate generator or supplied externally through the XCK line.

The synchronous mode is selected by writing a '1' to the Communication Mode bit in the Control A register (CTRLA.CMODE), the asynchronous mode is selected by writing a zero to CTRLA.CMODE.

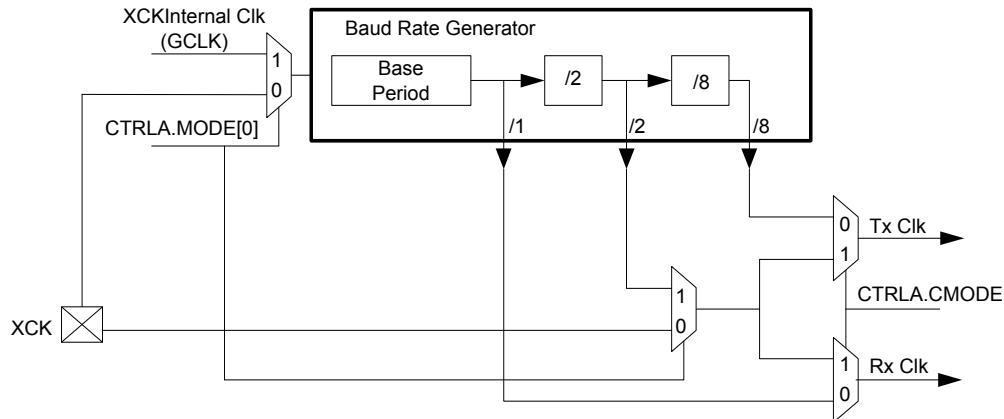

The internal clock source is selected by writing 0x1 to the Operation Mode bit field in the Control A register (CTRLA.MODE), the external clock source is selected by writing 0x0 to CTRLA.MODE.

The SERCOM baud-rate generator is configured as in the figure below.

In asynchronous mode (CTRLA.CMODE=0), the 16-bit Baud register value is used.

In synchronous mode (CTRLA.CMODE=1), the eight LSBs of the Baud register are used. Refer to *Clock Generation – Baud-Rate Generator* for details on configuring the baud rate.

**Figure 25-3. Clock Generation**

#### Related Links

[Clock Generation – Baud-Rate Generator](#) on page 373

[Asynchronous Arithmetic Mode BAUD Value Selection](#) on page 374

#### Synchronous Clock Operation

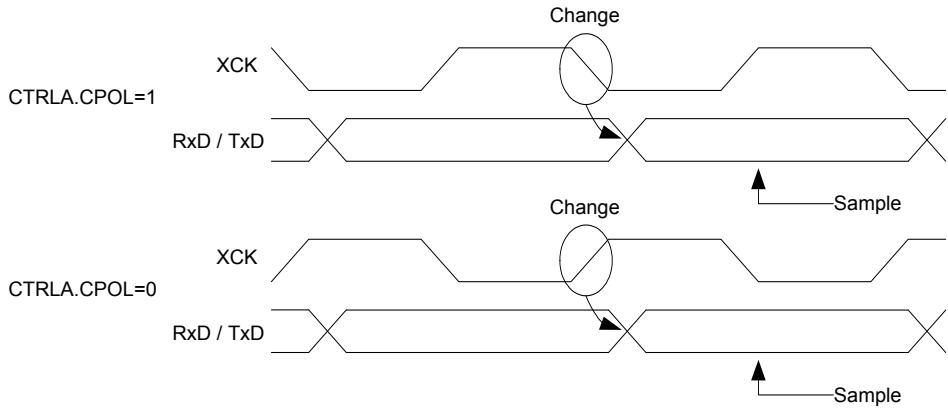

In synchronous mode, the CTRLA.MODE bit field determines whether the transmission clock line (XCK) serves either as input or output. The dependency between clock edges, data sampling, and data change is the same for internal and external clocks. Data input on the RxD pin is sampled at the opposite XCK clock edge when data is driven on the TxD pin.

The Clock Polarity bit in the Control A register (CTRLA.CPOL) selects which XCK clock edge is used for RxD sampling, and which is used for TxD change:

When CTRLA.CPOL is '0', the data will be changed on the rising edge of XCK, and sampled on the falling edge of XCK.

When CTRLA.CPOL is '1', the data will be changed on the falling edge of XCK, and sampled on the rising edge of XCK.

**Figure 25-4. Synchronous Mode XCK Timing**

When the clock is provided through XCK (`CTRLA.MODE=0x0`), the shift registers operate directly on the XCK clock. This means that XCK is not synchronized with the system clock and, therefore, can operate at frequencies up to the system frequency.

#### 25.6.2.4. Data Register

The USART Transmit Data register (TxDATA) and USART Receive Data register (RxDATA) share the same I/O address, referred to as the Data register (DATA). Writing the DATA register will update the TxDATA register. Reading the DATA register will return the contents of the RxDATA register.

#### 25.6.2.5. Data Transmission

Data transmission is initiated by writing the data to be sent into the DATA register. Then, the data in TxDATA will be moved to the shift register when the shift register is empty and ready to send a new frame. After the shift register is loaded with data, the data frame will be transmitted.

When the entire data frame including stop bit(s) has been transmitted and no new data was written to DATA, the Transmit Complete interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG.TXC) will be set, and the optional interrupt will be generated.

The Data Register Empty flag in the Interrupt Flag Status and Clear register (INTFLAG.DRE) indicates that the register is empty and ready for new data. The DATA register should only be written to when INTFLAG.DRE is set.

##### Disabling the Transmitter

The transmitter is disabled by writing '0' to the Transmitter Enable bit in the CTRLB register (CTRLB.TXEN).

Disabling the transmitter will complete only after any ongoing and pending transmissions are completed, i.e., there is no data in the transmit shift register and TxDATA to transmit.

#### 25.6.2.6. Data Reception

The receiver accepts data when a valid start bit is detected. Each bit following the start bit will be sampled according to the baud rate or XCK clock, and shifted into the receive shift register until the first stop bit of a frame is received. The second stop bit will be ignored by the receiver.

When the first stop bit is received and a complete serial frame is present in the receive shift register, the contents of the shift register will be moved into the two-level receive buffer. Then, the Receive Complete interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG.RXC) will be set, and the optional interrupt will be generated.

The received data can be read from the DATA register when the Receive Complete interrupt flag is set.

#### Related Links

[Clock Generation – Baud-Rate Generator](#) on page 373

#### Disabling the Receiver

Writing '0' to the Receiver Enable bit in the CTRLB register (CTRLB.RXEN) will disable the receiver, flush the two-level receive buffer, and data from ongoing receptions will be lost.

#### Error Bits

The USART receiver has three error bits in the Status (STATUS) register: Frame Error (FERR), Buffer Overflow (BUFOVF), and Parity Error (PERR). Once an error happens, the corresponding error bit will be set until it is cleared by writing '1' to it. These bits are also cleared automatically when the receiver is disabled.

There are two methods for buffer overflow notification, selected by the Immediate Buffer Overflow Notification bit in the Control A register (CTRLA.IBON):

When CTRLA.IBON=1, STATUS.BUFOVF is raised immediately upon buffer overflow. Software can then empty the receive FIFO by reading RxDATA, until the receiver complete interrupt flag (INTFLAG.RXC) is cleared.

When CTRLA.IBON=0, the buffer overflow condition is attending data through the receive FIFO. After the received data is read, STATUS.BUFOVF will be set along with INTFLAG.RXC.

#### Asynchronous Data Reception

The USART includes a clock recovery and data recovery unit for handling asynchronous data reception.

The clock recovery logic can synchronize the incoming asynchronous serial frames at the RxD pin to the internally generated baud-rate clock.

The data recovery logic samples and applies a low-pass filter to each incoming bit, thereby improving the noise immunity of the receiver.

#### Asynchronous Operational Range

The operational range of the asynchronous reception depends on the accuracy of the internal baud-rate clock, the rate of the incoming frames, and the frame size (in number of bits). In addition, the operational range of the receiver is depending on the difference between the received bit rate and the internally generated baud rate. If the baud rate of an external transmitter is too high or too low compared to the internally generated baud rate, the receiver will not be able to synchronize the frames to the start bit.

There are two possible sources for a mismatch in baud rate: First, the reference clock will always have some minor instability. Second, the baud-rate generator cannot always do an exact division of the reference clock frequency to get the baud rate desired. In this case, the BAUD register value should be set to give the lowest possible error. Refer to *Clock Generation – Baud-Rate Generator* for details.

Recommended maximum receiver baud-rate errors for various character sizes are shown in the table below.

**Table 25-3. Asynchronous Receiver Error for 16-fold Oversampling**

D (Data bits+Parity)	R <sub>SLOW</sub> [%]	R <sub>FAST</sub> [%]	Max. total error [%]	Recommended max. Rx error [%]
5	91.42	107.69	+5.88/-7.69	±2.5
6	94.92	106.67	+5.08/-6.67	±2.0
7	95.52	105.88	+4.48/-5.88	±2.0
8	96.00	105.26	+4.00/-5.26	±2.0

D (Data bits+Parity)	R <sub>SLOW</sub> [%]	R <sub>FAST</sub> [%]	Max. total error [%]	Recommended max. Rx error [%]
9	96.39	104.76	+3.61/-4.76	±1.5
10	96.70	104.35	+3.30/-4.35	±1.5

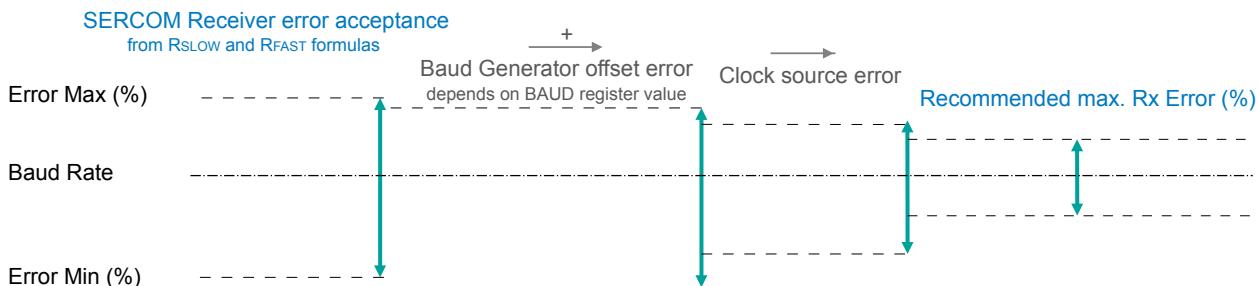

The following equations calculate the ratio of the incoming data rate and internal receiver baud rate:

$$R_{SLOW} = \frac{16(D + 1)}{16(D + 1) + 6} \quad , \quad R_{FAST} = \frac{16(D + 2)}{16(D + 1) + 8}$$

- $R_{SLOW}$  is the ratio of the slowest incoming data rate that can be accepted in relation to the receiver baud rate
- $R_{FAST}$  is the ratio of the fastest incoming data rate that can be accepted in relation to the receiver baud rate
- $D$  is the sum of character size and parity size ( $D = 5$  to  $10$  bits)

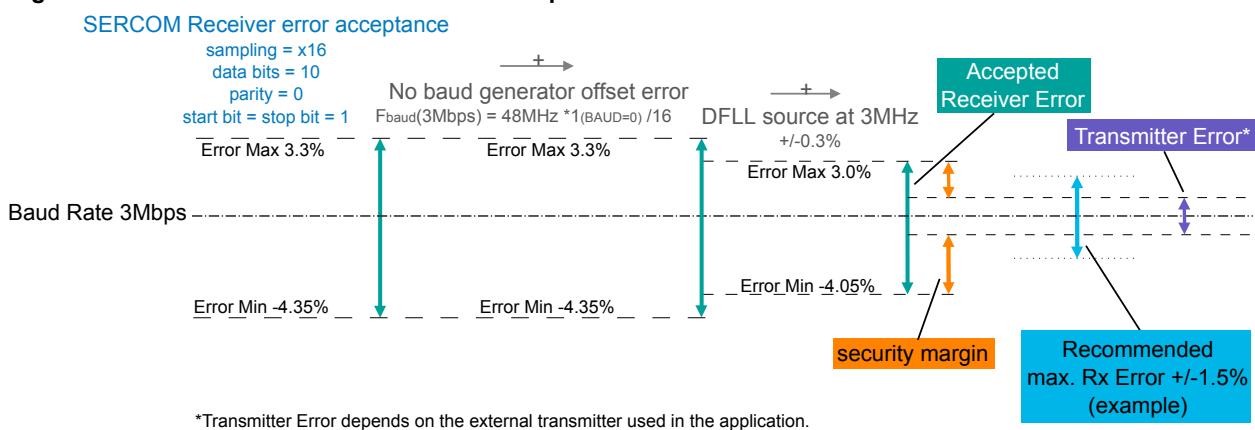

The recommended maximum Rx Error assumes that the receiver and transmitter equally divide the maximum total error. Its connection to the SERCOM Receiver error acceptance is depicted in this figure:

**Figure 25-5. USART Rx Error Calculation**

The recommendation values in the table above accommodate errors of the clock source and the baud generator. The following figure gives an example for a baud rate of 3Mbps:

**Figure 25-6. USART Rx Error Calculation Example**

### 25.6.3. Additional Features

#### 25.6.3.1. Parity

Even or odd parity can be selected for error checking by writing 0x1 to the Frame Format bit field in the Control A register (CTRLA.FORM).

If *even parity* is selected (CTRLB.PMODE=0), the parity bit of an outgoing frame is '1' if the data contains an odd number of bits that are '1', making the total number of '1' even.

If *odd parity* is selected (CTRLB.PMODE=1), the parity bit of an outgoing frame is '1' if the data contains an even number of bits that are '0', making the total number of '1' odd.

When parity checking is enabled, the parity checker calculates the parity of the data bits in incoming frames and compares the result with the parity bit of the corresponding frame. If a parity error is detected, the Parity Error bit in the Status register (STATUS.PERR) is set.

#### 25.6.3.2. Loop-Back Mode

For loop-back mode, configure the Receive Data Pinout (CTRLA.RXPO) and Transmit Data Pinout (CTRLA.TXPO) to use the same data pins for transmit and receive. The loop-back is through the pad, so the signal is also available externally.

#### 25.6.3.3. Start-of-Frame Detection

The USART start-of-frame detector can wake up the CPU when it detects a start bit. In standby sleep mode, the internal fast startup oscillator must be selected as the GCLK\_SERCOMx\_CORE source.

When a 1-to-0 transition is detected on RxD, the 8MHz Internal Oscillator is powered up and the USART clock is enabled. After startup, the rest of the data frame can be received, provided that the baud rate is slow enough in relation to the fast startup internal oscillator start-up time. Refer to *Electrical Characteristics* for details. The start-up time of this oscillator varies with supply voltage and temperature.

The USART start-of-frame detection works both in asynchronous and synchronous modes. It is enabled by writing '1' to the Start of Frame Detection Enable bit in the Control B register (CTRLB.SFDE).

If the Receive Start Interrupt Enable bit in the Interrupt Enable Set register (INTENSET.RXS) is set, the Receive Start interrupt is generated immediately when a start is detected.

When using start-of-frame detection without the Receive Start interrupt, start detection will force the 8MHz Internal Oscillator and USART clock active while the frame is being received. In this case, the CPU will not wake up until the Receive Complete interrupt is generated.

#### Related Links

[Electrical Characteristics](#) on page 606

#### 25.6.4. Interrupts

The USART has the following interrupt sources. These are asynchronous interrupts, and can wake up the device from any sleep mode:

- Data Register Empty (DRE)
- Receive Complete (RXC)
- Transmit Complete (TXC)
- Receive Start (RXS)

Each interrupt source has its own interrupt flag. The interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG) will be set when the interrupt condition is met. Each interrupt can be individually enabled by writing '1' to the corresponding bit in the Interrupt Enable Set register (INTENSET), and disabled by writing '1' to the corresponding bit in the Interrupt Enable Clear register (INTENCLR).

An interrupt request is generated when the interrupt flag is set and if the corresponding interrupt is enabled. The interrupt request remains active until either the interrupt flag is cleared, the interrupt is disabled, or the USART is reset. For details on clearing interrupt flags, refer to the INTFLAG register description.

The USART has one common interrupt request line for all the interrupt sources. The value of INTFLAG indicates which interrupt is executed. Note that interrupts must be globally enabled for interrupt requests. Refer to *Nested Vector Interrupt Controller* for details.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

#### 25.6.5. Sleep Mode Operation

The behavior in sleep mode is depending on the clock source and the Run In Standby bit in the Control A register (CTRLA.RUNSTDBY):

- Internal clocking, CTRLA.RUNSTDBY=1: GCLK\_SERCOMx\_CORE can be enabled in all sleep modes. Any interrupt can wake up the device.
- External clocking, CTRLA.RUNSTDBY=1: The Receive Complete interrupt(s) can wake up the device.
- Internal clocking, CTRLA.RUNSTDBY=0: Internal clock will be disabled, after any ongoing transfer was completed. The Receive Complete interrupt(s) can wake up the device.
- External clocking, CTRLA.RUNSTDBY=0: External clock will be disconnected, after any ongoing transfer was completed. All reception will be dropped.

#### 25.6.6. Synchronization

Due to asynchronicity between the main clock domain and the peripheral clock domains, some registers need to be synchronized when written or read.

Required write-synchronization is denoted by the "Write-Synchronized" property in the register description.

Required read-synchronization is denoted by the "Read-Synchronized" property in the register description.

## 25.8. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16-, and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers require synchronization when read and/or written. Synchronization is denoted by the "Read-Synchronized" and/or "Write-Synchronized" property in each individual register description.

Optional write-protection by the Peripheral Access Controller (PAC) is denoted by the "PAC Write-Protection" property in each individual register description.

Some registers are enable-protected, meaning they can only be written when the module is disabled. Enable-protection is denoted by the "Enable-Protected" property in each individual register description.

### 25.8.1. Control A

**Name:** CTRLA

**Offset:** 0x00

**Reset:** 0x00000000

**Property:** PAC Write-Protection, Enable-Protected, Write-Synchronized

Bit	31	30	29	28	27	26	25	24	
		DORD	CPOL	CMODE	FORM[3:0]				
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset		0	0	0	0	0	0	0	
Bit	23	22	21	20	19	18	17	16	
			RXPO[1:0]					TXPO	
Access			R/W	R/W				R/W	
Reset			0	0				0	
Bit	15	14	13	12	11	10	9	8	
								IBON	
Access								R	
Reset								0	
Bit	7	6	5	4	3	2	1	0	
	RUNSTDBY			MODE[2:0]			ENABLE	SWRST	
Access	R/W			R/W	R/W	R/W	R/W	R/W	
Reset	0			0	0	0	0	0	

#### Bit 30 – DORD: Data Order

This bit selects the data order when a character is shifted out from the Data register.

This bit is not synchronized.

Value	Description
0	MSB is transmitted first.
1	LSB is transmitted first.

#### Bit 29 – CPOL: Clock Polarity

This bit selects the relationship between data output change and data input sampling in synchronous mode.

This bit is not synchronized.

CPOL	TxD Change	RxD Sample
0x0	Rising XCK edge	Falling XCK edge
0x1	Falling XCK edge	Rising XCK edge

#### Bit 28 – CMODE: Communication Mode

This bit selects asynchronous or synchronous communication.

This bit is not synchronized.

Value	Description
0	Asynchronous communication.
1	Synchronous communication.

#### Bits 27:24 – FORM[3:0]: Frame Format

These bits define the frame format.

These bits are not synchronized.

FORM[3:0]	Description
0x0	USART frame
0x1	USART frame with parity
0x2-0xF	Reserved

#### Bits 21:20 – RXPO[1:0]: Receive Data Pinout

These bits define the receive data (RxD) pin configuration.

These bits are not synchronized.

RXPO[1:0]	Name	Description
0x0	PAD[0]	SERCOM PAD[0] is used for data reception
0x1	PAD[1]	SERCOM PAD[1] is used for data reception
0x2	PAD[2]	SERCOM PAD[2] is used for data reception
0x3	PAD[3]	SERCOM PAD[3] is used for data reception

#### Bit 16 – TXPO: Transmit Data Pinout

These bits define the transmit data (TxD) and XCK pin configurations.

This bit is not synchronized.

TXPO	TxD Pin Location	XCK Pin Location (When Applicable)
0x0	SERCOM PAD[0]	SERCOM PAD[1]
0x1	SERCOM PAD[2]	SERCOM PAD[3]

#### Bit 8 – IBON: Immediate Buffer Overflow Notification

This bit controls when the buffer overflow status bit (STATUS.BUFOVF) is asserted when a buffer overflow occurs.

Value	Description
0	STATUS.BUFOVF is asserted when it occurs in the data stream.
1	STATUS.BUFOVF is asserted immediately upon buffer overflow.

#### Bit 7 – RUNSTDBY: Run In Standby

This bit defines the functionality in standby sleep mode.

This bit is not synchronized.

RUNSTDBY	External Clock	Internal Clock
0x0	External clock is disconnected when ongoing transfer is finished. All reception is dropped.	Generic clock is disabled when ongoing transfer is finished. The device can wake up on Receive Start or Transfer Complete interrupt.
0x1	Wake on Receive Start or Receive Complete interrupt.	Generic clock is enabled in all sleep modes. Any interrupt can wake up the device.

#### Bits 4:2 – MODE[2:0]: Operating Mode

These bits select the USART serial communication interface of the SERCOM.

These bits are not synchronized.

Value	Description
0x0	USART with external clock
0x1	USART with internal clock

#### Bit 1 – ENABLE: Enable

Due to synchronization, there is delay from writing CTRLA.ENABLE until the peripheral is enabled/disabled. The value written to CTRLA.ENABLE will read back immediately and the Enable Synchronization Busy bit in the Synchronization Busy register (SYNCBUSY.ENABLE) will be set. SYNCBUSY.ENABLE is cleared when the operation is complete.

This bit is not enable-protected.

Value	Description
0	The peripheral is disabled or being disabled.
1	The peripheral is enabled or being enabled.

#### Bit 0 – SWRST: Software Reset

Writing '0' to this bit has no effect.

Writing '1' to this bit resets all registers in the SERCOM, except DBGCTRL, to their initial state, and the SERCOM will be disabled.

Writing '1' to CTRLA.SWRST will always take precedence, meaning that all other writes in the same write-operation will be discarded. Any register write access during the ongoing reset will result in an APB error. Reading any register will return the reset value of the register.

Due to synchronization, there is a delay from writing CTRLA.SWRST until the reset is complete. CTRLA.SWRST and SYNCBUSY.SWRST will both be cleared when the reset is complete.

This bit is not enable-protected.

Value	Description
0	There is no reset operation ongoing.
1	The reset operation is ongoing.

## 25.8.2. Control B

**Name:** CTRLB

**Offset:** 0x04

**Reset:** 0x00000000

**Property:** PAC Write-Protection, Enable-Protected, Write-Synchronized

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access							R/W	R/W
Reset							0	0
Bit	15	14	13	12	11	10	9	8
Access			PMODE				R/W	
Reset							0	
Bit	7	6	5	4	3	2	1	0
Access		SBMODE					CHSIZE[2:0]	
Reset			R/W			R/W	R/W	R/W

### Bit 17 – RXEN: Receiver Enable

Writing '0' to this bit will disable the USART receiver. Disabling the receiver will flush the receive buffer and clear the FERR, PERR and BUFOVF bits in the STATUS register.

Writing '1' to CTRLB.RXEN when the USART is disabled will set CTRLB.RXEN immediately. When the USART is enabled, CTRLB.RXEN will be cleared, and SYNCBUSY.CTRLB will be set and remain set until the receiver is enabled. When the receiver is enabled, CTRLB.RXEN will read back as '1'.

Writing '1' to CTRLB.RXEN when the USART is enabled will set SYNCBUSY.CTRLB, which will remain set until the receiver is enabled, and CTRLB.RXEN will read back as '1'.

This bit is not enable-protected.

Value	Description
0	The receiver is disabled or being enabled.
1	The receiver is enabled or will be enabled when the USART is enabled.

### Bit 16 – TXEN: Transmitter Enable

Writing '0' to this bit will disable the USART transmitter. Disabling the transmitter will not become effective until ongoing and pending transmissions are completed.

Writing '1' to CTRLB.TXEN when the USART is disabled will set CTRLB.TXEN immediately. When the USART is enabled, CTRLB.TXEN will be cleared, and SYNCBUSY.CTRLB will be set and remain set until the transmitter is enabled. When the transmitter is enabled, CTRLB.TXEN will read back as '1'.

Writing '1' to CTRLB.TXEN when the USART is enabled will set SYNCBUSY.CTRLB, which will remain set until the receiver is enabled, and CTRLB.TXEN will read back as '1'.

This bit is not enable-protected.

Value	Description
0	The transmitter is disabled or being enabled.
1	The transmitter is enabled or will be enabled when the USART is enabled.

#### Bit 13 – PMODE: Parity Mode

This bit selects the type of parity used when parity is enabled (CTRLA.FORM is '1'). The transmitter will automatically generate and send the parity of the transmitted data bits within each frame. The receiver will generate a parity value for the incoming data and parity bit, compare it to the parity mode and, if a mismatch is detected, STATUS.PERR will be set.

This bit is not synchronized.

Value	Description
0	Even parity.
1	Odd parity.

#### Bit 9 – SFDE: Start of Frame Detection Enable

This bit controls whether the start-of-frame detector will wake up the device when a start bit is detected on the RxD line.

This bit is not synchronized.

SFDE	INTENSET.RXS	INTENSET.RXC	Description
0	X	X	Start-of-frame detection disabled.
1	0	0	Reserved
1	0	1	Start-of-frame detection enabled. RXC wakes up the device from all sleep modes.
1	1	0	Start-of-frame detection enabled. RXS wakes up the device from all sleep modes.
1	1	1	Start-of-frame detection enabled. Both RXC and RXS wake up the device from all sleep modes.

#### Bit 6 – SBMODE: Stop Bit Mode

This bit selects the number of stop bits transmitted.

This bit is not synchronized.

Value	Description
0	One stop bit.
1	Two stop bits.

#### Bits 2:0 – CHSIZE[2:0]: Character Size

These bits select the number of bits in a character.

These bits are not synchronized.

<b>CHSIZE[2:0]</b>	<b>Description</b>
0x0	8 bits
0x1	9 bits
0x2-0x4	Reserved
0x5	5 bits
0x6	6 bits
0x7	7 bits

### 25.8.3. Debug Control

**Name:** DBGCTRL  
**Offset:** 0x08  
**Reset:** 0x00  
**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access								DBGSTOP
Reset								0

#### Bit 0 – DBGSTOP: Debug Stop Mode

This bit controls the baud-rate generator functionality when the CPU is halted by an external debugger.

Value	Description
0	The baud-rate generator continues normal operation when the CPU is halted by an external debugger.
1	The baud-rate generator is halted when the CPU is halted by an external debugger.

#### 25.8.4. Baud

**Name:** BAUD  
**Offset:** 0x0A  
**Reset:** 0x0000  
**Property:** Enable-Protected, PAC Write-Protection

Bit	15	14	13	12	11	10	9	8
BAUD[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
BAUD[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

##### Bits 15:0 – BAUD[15:0]: Baud Value

These bits control the clock generation, as described in the SERCOM Baud Rate section.

- **Bits 15:0 - BAUD[15:0]: Baud Value**

These bits control the clock generation, as described in the *SERCOM Clock Generation – Baud-Rate Generator* section.

### 25.8.5. Interrupt Enable Clear

This register allows the user to disable an interrupt without doing a read-modify-write operation. Changes in this register will also be reflected in the Interrupt Enable Set register (INTENSET).

**Name:** INTENCLR

**Offset:** 0x0C

**Reset:** 0x00

**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

#### Bit 3 – RXS: Receive Start Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Receive Start Interrupt Enable bit, which disables the Receive Start interrupt.

Value	Description
0	Receive Start interrupt is disabled.
1	Receive Start interrupt is enabled.

#### Bit 2 – RXC: Receive Complete Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Receive Complete Interrupt Enable bit, which disables the Receive Complete interrupt.

Value	Description
0	Receive Complete interrupt is disabled.
1	Receive Complete interrupt is enabled.

#### Bit 1 – TXC: Transmit Complete Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Transmit Complete Interrupt Enable bit, which disables the Receive Complete interrupt.

Value	Description
0	Transmit Complete interrupt is disabled.
1	Transmit Complete interrupt is enabled.

#### Bit 0 – DRE: Data Register Empty Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Data Register Empty Interrupt Enable bit, which disables the Data Register Empty interrupt.

Value	Description
0	Data Register Empty interrupt is disabled.
1	Data Register Empty interrupt is enabled.

### 25.8.6. Interrupt Enable Set

This register allows the user to disable an interrupt without doing a read-modify-write operation. Changes in this register will also be reflected in the Interrupt Enable Clear register (INTENCLR).

**Name:** INTENSET

**Offset:** 0x0D

**Reset:** 0x00

**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access					R/X	R/W	R/W	R/W
Reset					0	0	0	0

#### Bit 3 – RXS: Receive Start Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will set the Receive Start Interrupt Enable bit, which enables the Receive Start interrupt.

Value	Description
0	Receive Start interrupt is disabled.
1	Receive Start interrupt is enabled.

#### Bit 2 – RXC: Receive Complete Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will set the Receive Complete Interrupt Enable bit, which enables the Receive Complete interrupt.

Value	Description
0	Receive Complete interrupt is disabled.
1	Receive Complete interrupt is enabled.

#### Bit 1 – TXC: Transmit Complete Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will set the Transmit Complete Interrupt Enable bit, which enables the Transmit Complete interrupt.

Value	Description
0	Transmit Complete interrupt is disabled.
1	Transmit Complete interrupt is enabled.

#### Bit 0 – DRE: Data Register Empty Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will set the Data Register Empty Interrupt Enable bit, which enables the Data Register Empty interrupt.

Value	Description
0	Data Register Empty interrupt is disabled.
1	Data Register Empty interrupt is enabled.

### 25.8.7. Interrupt Flag Status and Clear

**Name:** INTFLAG

**Offset:** 0x0E

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0
Access					R/W	R	R/W	R
Reset					0	0	0	0
					RXS	RXC	TXC	DRE

#### Bit 3 – RXS: Receive Start

This flag is cleared by writing '1' to it.

This flag is set when a start condition is detected on the RxD line and start-of-frame detection is enabled (CTRLB.SFDE is '1').

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Receive Start interrupt flag.

#### Bit 2 – RXC: Receive Complete

This flag is cleared by reading the Data register (DATA) or by disabling the receiver.

This flag is set when there are unread data in DATA.

Writing '0' to this bit has no effect.

Writing '1' to this bit has no effect.

#### Bit 1 – TXC: Transmit Complete

This flag is cleared by writing '1' to it or by writing new data to DATA.

This flag is set when the entire frame in the transmit shift register has been shifted out and there are no new data in DATA.

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the flag.

#### Bit 0 – DRE: Data Register Empty

This flag is cleared by writing new data to DATA.

This flag is set when DATA is empty and ready to be written.

Writing '0' to this bit has no effect.

Writing '1' to this bit has no effect.

## 25.8.8. Status

**Name:** STATUS

**Offset:** 0x10

**Reset:** 0x0000

**Property:** -

Bit	15	14	13	12	11	10	9	8
	SYNCBUSY							
Access	R/W							
Reset	0							
Bit	7	6	5	4	3	2	1	0
						BUFOVF	FERR	PERR
Access						R/W	R/W	R/W
Reset						0	0	0

### Bit 15 – SYNCBUSY: Synchronization Busy

This bit is cleared when the synchronization of registers between the clock domains is complete.

This bit is set when the synchronization of registers between clock domains is started.

### Bit 2 – BUFOVF: Buffer Overflow

Reading this bit before reading the Data register will indicate the error status of the next character to be read.

This bit is cleared by writing '1' to the bit or by disabling the receiver.

This bit is set when a buffer overflow condition is detected. A buffer overflow occurs when the receive buffer is full, there is a new character waiting in the receive shift register and a new start bit is detected.

Value	Description
0	Writing '0' to this bit has no effect.
1	Writing '1' to this bit will clear it.

### Bit 1 – FERR: Frame Error

Reading this bit before reading the Data register will indicate the error status of the next character to be read.

This bit is cleared by writing '1' to the bit or by disabling the receiver.

This bit is set if the received character had a frame error, i.e., when the first stop bit is zero.

Value	Description
0	Writing '0' to this bit has no effect.
1	Writing '1' to this bit will clear it.

### Bit 0 – PERR: Parity Error

Reading this bit before reading the Data register will indicate the error status of the next character to be read.

This bit is cleared by writing '1' to the bit or by disabling the receiver.

This bit is set if parity checking is enabled (CTRLA.FORM is 0x1) and a parity error is detected.

Value	Description
0	Writing '0' to this bit has no effect.
1	Writing '1' to this bit will clear it.

## 25.8.9. Data

**Name:** DATA

**Offset:** 0x18

**Reset:** 0x0000

**Property:** -

Bit	15	14	13	12	11	10	9	8
Access								R/W
Reset								0
Bit	7	6	5	4	3	2	1	0
	DATA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 8:0 – DATA[8:0]: Data

Reading these bits will return the contents of the Receive Data register. The register should be read only when the Receive Complete Interrupt Flag bit in the Interrupt Flag Status and Clear register (INTFLAG.RXC) is set. The status bits in STATUS should be read before reading the DATA value in order to get any corresponding error.

Writing these bits will write the Transmit Data register. This register should be written only when the Data Register Empty Interrupt Flag bit in the Interrupt Flag Status and Clear register (INTFLAG.DRE) is set.

## 26. SERCOM SPI – SERCOM Serial Peripheral Interface

### 26.1. Overview

The serial peripheral interface (SPI) is one of the available modes in the Serial Communication Interface (SERCOM).

The SPI uses the SERCOM transmitter and receiver configured as shown in [Block Diagram](#). Each side, master and slave, depicts a separate SPI containing a shift register, a transmit buffer and two receive buffers. In addition, the SPI master uses the SERCOM baud-rate generator, while the SPI slave can use the SERCOM address match logic. Labels in capital letters are synchronous to CLK\_SERCOMx\_APB and accessible by the CPU, while labels in lowercase letters are synchronous to the SCK clock.

#### Related Links

[SERCOM – Serial Communication Interface](#) on page 369

### 26.2. Features

SERCOM SPI includes the following features:

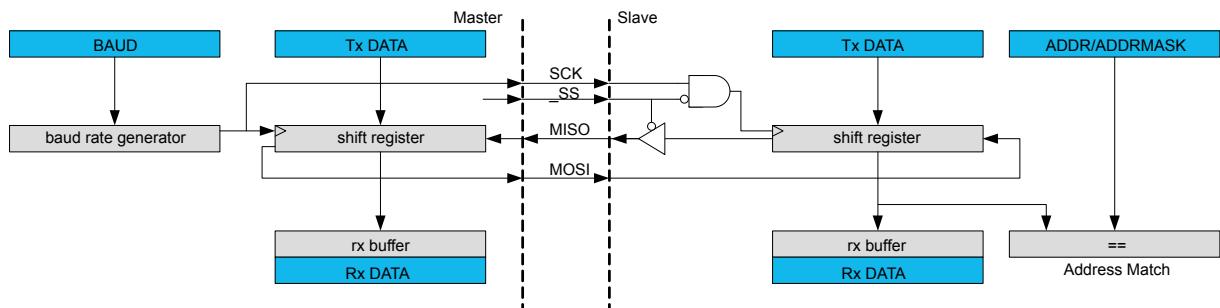

- Full-duplex, four-wire interface (MISO, MOSI, SCK, SS)
  - Single-buffered transmitter, double-buffered receiver
  - Supports all four SPI modes of operation
  - Single data direction operation allows alternate function on MISO or MOSI pin
  - Selectable LSB- or MSB-first data transfer
  - Master operation:
    - Serial clock speed,  $f_{SCK}=1/t_{SCK}^{(1)}$
    - 8-bit clock generator
  - Slave operation:
    - Serial clock speed,  $f_{SCK}=1/t_{SSCK}^{(1)}$
    - Optional 8-bit address match operation
    - Operation in all sleep modes
1. For  $t_{SCK}$  and  $t_{SSCK}$  values, refer to SPI Timing Characteristics.

#### Related Links

[SERCOM – Serial Communication Interface](#) on page 369

## 26.3. Block Diagram

Figure 26-1. Full-Duplex SPI Master Slave Interconnection

## 26.4. Signal Description

Table 26-1. SERCOM SPI Signals

Signal Name	Type	Description
PAD[3:0]	Digital I/O	General SERCOM pins

One signal can be mapped to one of several pins.

### Related Links

[I/O Multiplexing and Considerations](#) on page 27

## 26.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly, as described below.

### 26.5.1. I/O Lines

In order to use the SERCOM's I/O lines, the I/O pins must be configured using the IO Pin Controller (PORT).

When the SERCOM is configured for SPI operation, the SERCOM controls the direction and value of the I/O pins according to the table below. Both PORT control bits PINCFGn.PULLEN and PINCFGn.DRVSTR are still effective. If the receiver is disabled, the data input pin can be used for other purposes. In master mode, the slave select line ( $\overline{SS}$ ) is controlled by software.

Table 26-2. SPI Pin Configuration

Pin	Master SPI	Slave SPI
MOSI	Output	Input
MISO	Input	Output
SCK	Output	Input
$\overline{SS}$	User defined output enable	Input

The combined configuration of PORT, the Data In Pinout and the Data Out Pinout bit groups in the Control A register (CTRLA.DIPO and CTRLA.DOPO) define the physical position of the SPI signals in the table above.

## Related Links

[PORT: IO Pin Controller](#) on page 320

### 26.5.2. Power Management

This peripheral can continue to operate in any sleep mode where its source clock is running. The interrupts can wake up the device from sleep modes.

## Related Links

[PM – Power Manager](#) on page 129

### 26.5.3. Clocks

The SERCOM bus clock (CLK\_SERCOMx\_APPB) is enabled by default, and can be enabled and disabled in the Power Manager.

A generic clock (GCLK\_SERCOMx\_CORE) is required to clock the SPI. This clock must be configured and enabled in the Generic Clock Controller before using the SPI.

This generic clock is asynchronous to the bus clock (CLK\_SERCOMx\_APB). Therefore, writes to certain registers will require synchronization to the clock domains.

## Related Links

[GCLK - Generic Clock Controller](#) on page 108

[Synchronization](#) on page 415

### 26.5.4. Interrupts

The interrupt request line is connected to the Interrupt Controller. In order to use interrupt requests of this peripheral, the Interrupt Controller (NVIC) must be configured first. Refer to *Nested Vector Interrupt Controller* for details.

## Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 26.5.5. Events

Not applicable.

### 26.5.6. Debug Operation

When the CPU is halted in debug mode, this peripheral will continue normal operation. If the peripheral is configured to require periodical service by the CPU through interrupts or similar, improper operation or data loss may result during debugging. This peripheral can be forced to halt operation during debugging - refer to the Debug Control (DBGCTRL) register for details.

### 26.5.7. Register Access Protection

Registers with write-access can be write-protected optionally by the peripheral access controller (PAC).

PAC Write-Protection is not available for the following registers:

- Interrupt Flag Clear and Status register (INTFLAG)
- Status register (STATUS)
- Data register (DATA)

Optional PAC Write-Protection is denoted by the "PAC Write-Protection" property in each individual register description.

Write-protection does not apply to accesses through an external debugger.

## Related Links

[PAC - Peripheral Access Controller](#) on page 45

### 26.5.8. Analog Connections

Not applicable.

## 26.6. Functional Description

### 26.6.1. Principle of Operation

The SPI is a high-speed synchronous data transfer interface. It allows high-speed communication between the device and peripheral devices.

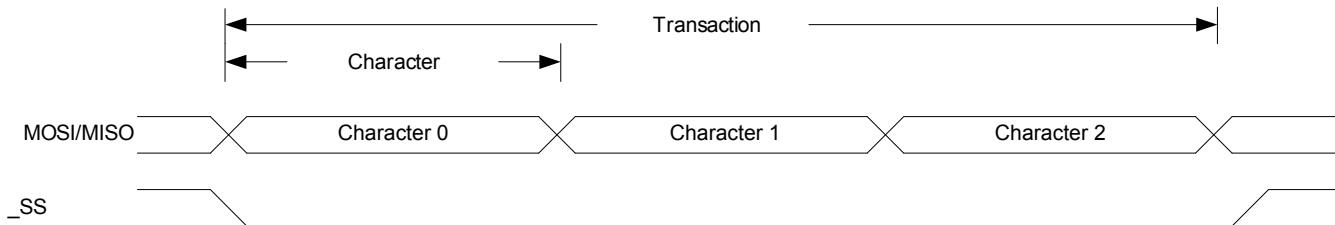

The SPI can operate as master or slave. As master, the SPI initiates and controls all data transactions. The SPI is single buffered for transmitting and double buffered for receiving.

When transmitting data, the Data register can be loaded with the next character to be transmitted during the current transmission.

When receiving, the data is transferred to the two-level receive buffer, and the receiver is ready for a new character.

The SPI transaction format is shown in [SPI Transaction Format](#). Each transaction can contain one or more characters. The character size is configurable, and can be either 8 or 9 bits.

**Figure 26-2. SPI Transaction Format**

The SPI master must pull the slave select line ( $\overline{SS}$ ) of the desired slave low to initiate a transaction. The master and slave prepare data to send via their respective shift registers, and the master generates the serial clock on the SCK line.

Data are always shifted from master to slave on the Master Output Slave Input line (MOSI); data is shifted from slave to master on the Master Input Slave Output line (MISO).

Each time character is shifted out from the master, a character will be shifted out from the slave simultaneously. To signal the end of a transaction, the master will pull the  $\overline{SS}$  line high.

### 26.6.2. Basic Operation

#### 26.6.2.1. Initialization

The following registers are enable-protected, meaning that they can only be written when the SPI is disabled (CTRLA.ENABLE=0):

- Control A register (CTRLA), except Enable (CTRLA.ENABLE) and Software Reset (CTRLA.SWRST)
- Control B register (CTRLB), except Receiver Enable (CTRLB.RXEN)
- Baud register (BAUD)
- Address register (ADDR)

When the SPI is enabled or is being enabled (CTRLA.ENABLE=1), any writing to these registers will be discarded.

when the SPI is being disabled, writing to these registers will be completed after the disabling.

Enable-protection is denoted by the Enable-Protection property in the register description.

Initialize the SPI by following these steps:

1. Select SPI mode in master / slave operation in the Operating Mode bit group in the CTRLA register (CTRLA.MODE= 0x2 or 0x3 ).
2. Select transfer mode for the Clock Polarity bit and the Clock Phase bit in the CTRLA register (CTRLA.CPOL and CTRLA.CPHA) if desired.
3. Select the Frame Format value in the CTRLA register (CTRLA.FORM).
4. Configure the Data In Pinout field in the Control A register (CTRLA.DIPO) for SERCOM pads of the receiver.
5. Configure the Data Out Pinout bit group in the Control A register (CTRLA.DOPO) for SERCOM pads of the transmitter.
6. Select the Character Size value in the CTRLB register (CTRLB.CHSIZE).
7. Write the Data Order bit in the CTRLA register (CTRLA.DORD) for data direction.
8. If the SPI is used in master mode:
  - 8.1. Select the desired baud rate by writing to the Baud register (BAUD).
9. Enable the receiver by writing the Receiver Enable bit in the CTRLB register (CTRLB.RXEN=1).

#### 26.6.2.2. Enabling, Disabling, and Resetting

This peripheral is enabled by writing '1' to the Enable bit in the Control A register (CTRLA.ENABLE), and disabled by writing '0' to it.

Writing '1' to the Software Reset bit in the Control A register (CTRLA.SWRST) will reset all registers of this peripheral to their initial states, except the DBGCTRL register, and the peripheral is disabled.

Refer to the CTRLA register description for details.

#### 26.6.2.3. Clock Generation

In SPI master operation (CTRLA.MODE=0x3), the serial clock (SCK) is generated internally by the SERCOM baud-rate generator.

In SPI mode, the baud-rate generator is set to synchronous mode. The 8-bit Baud register (BAUD) value is used for generating SCK and clocking the shift register. Refer to *Clock Generation – Baud-Rate Generator* for more details.

In SPI slave operation (CTRLA.MODE is 0x2), the clock is provided by an external master on the SCK pin. This clock is used to directly clock the SPI shift register.

#### Related Links

[Clock Generation – Baud-Rate Generator](#) on page 373

[Asynchronous Arithmetic Mode BAUD Value Selection](#) on page 374

#### 26.6.2.4. Data Register

The SPI Transmit Data register (TxDATA) and SPI Receive Data register (RxDATA) share the same I/O address, referred to as the SPI Data register (DATA). Writing DATA register will update the Transmit Data register. Reading the DATA register will return the contents of the Receive Data register.

#### 26.6.2.5. SPI Transfer Modes

There are four combinations of SCK phase and polarity to transfer serial data. The SPI data transfer modes are shown in [SPI Transfer Modes \(Table\)](#) and [SPI Transfer Modes \(Figure\)](#).

SCK phase is configured by the Clock Phase bit in the CTRLA register (CTRLA.CPHA). SCK polarity is programmed by the Clock Polarity bit in the CTRLA register (CTRLA.CPOL). Data bits are shifted out and latched in on opposite edges of the SCK signal. This ensures sufficient time for the data signals to stabilize.

**Table 26-3. SPI Transfer Modes**

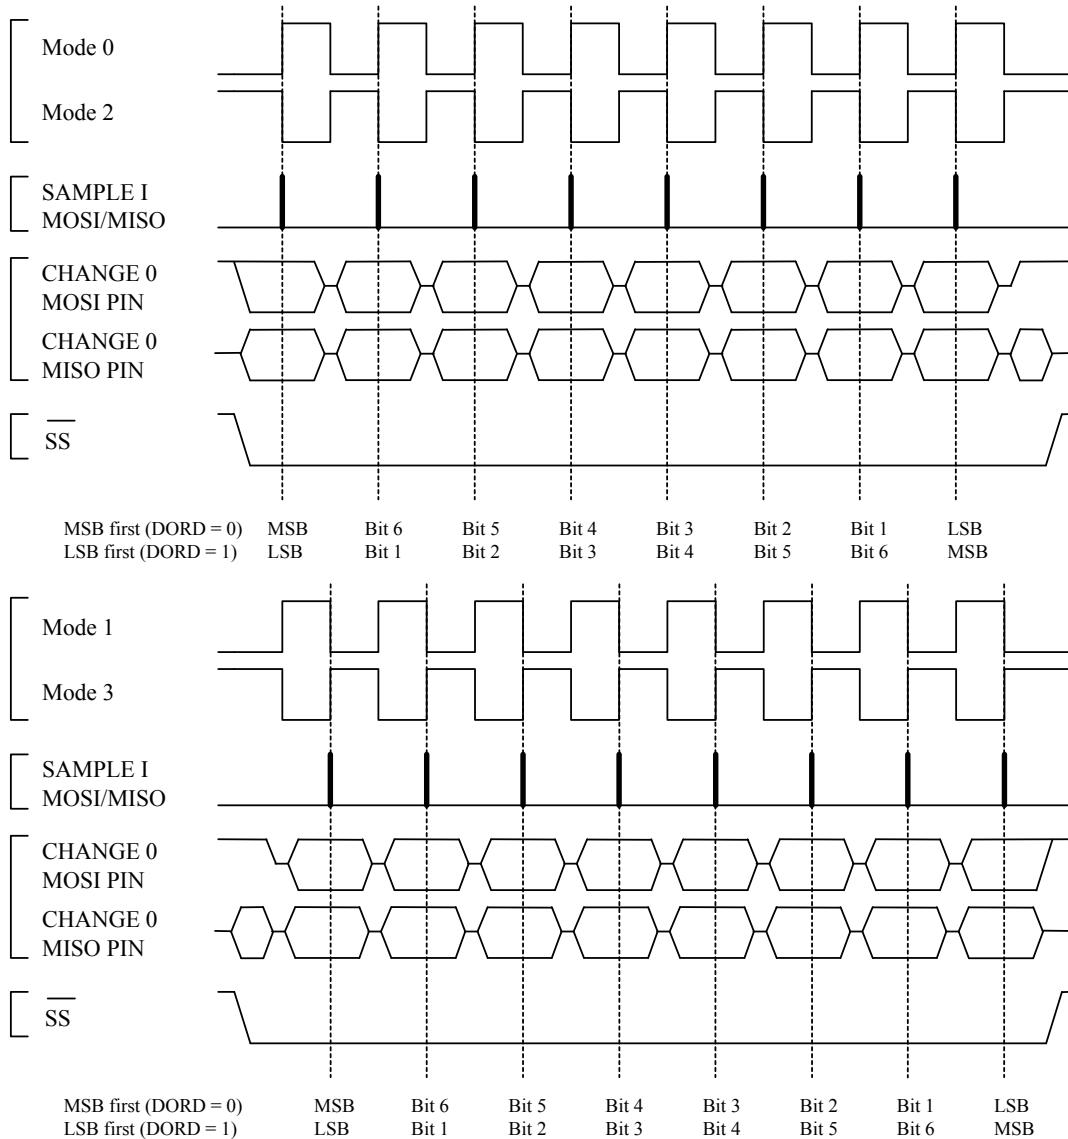

Mode	CPOL	CPHA	Leading Edge	Trailing Edge
0	0	0	Rising, sample	Falling, setup
1	0	1	Rising, setup	Falling, sample
2	1	0	Falling, sample	Rising, setup
3	1	1	Falling, setup	Rising, sample

**Note:**

Leading edge is the first clock edge in a clock cycle.

Trailing edge is the second clock edge in a clock cycle.

**Figure 26-3. SPI Transfer Modes**

#### 26.6.2.6. Transferring Data

##### Master

In master mode (CTRLA.MODE=0x3), the **SS** line must be configured as an output. **SS** can be assigned to any general purpose I/O pin. When the SPI is ready for a data transaction, software must pull the **SS** line low.

When writing a character to the Data register (DATA), the character will be transferred to the shift register. Once the content of TxDATA has been transferred to the shift register, the Data Register Empty flag in the Interrupt Flag Status and Clear register (INTFLAG.DRE) will be set. And a new character can be written to DATA.

Each time one character is shifted out from the master, another character will be shifted in from the slave simultaneously. If the receiver is enabled (CTRLA.RXEN=1), the contents of the shift register will be transferred to the two-level receive buffer. The transfer takes place in the same clock cycle as the last data bit is shifted in. And the Receive Complete Interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG.RXC) will be set. The received data can be retrieved by reading DATA.

When the last character has been transmitted and there is no valid data in DATA, the Transmit Complete Interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG.TXC) will be set. When the transaction is finished, the master must pull the SS line high to notify the slave.

#### Slave

In slave mode (CTRLA.MODE=0x2), the SPI interface will remain inactive with the MISO line tri-stated as long as the SS pin is pulled high. Software may update the contents of DATA at any time as long as the Data Register Empty flag in the Interrupt Status and Clear register (INTFLAG.DRE) is set.

When SS is pulled low and SCK is running, the slave will sample and shift out data according to the transaction mode set. When the content of TxDATA has been loaded into the shift register, INTFLAG.DRE will be set, and new data can be written to DATA.

Similar to the master, the slave will receive one character for each character transmitted. A character will be transferred into the two-level receive buffer within the same clock cycle its last data bit is received. The received character can be retrieved from DATA when the Receive Complete interrupt flag (INTFLAG.RXC) is set.

When the master pulls the SS line high, the transaction is done and the Transmit Complete Interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG.TXC) will be set.

After DATA is written it takes up to three SCK clock cycles until the content of DATA is ready to be loaded into the shift register on the next character boundary. As a consequence, the first character transferred in a SPI transaction will not be the content of DATA. This can be avoided by using the preloading feature.

Refer to [Preloading of the Slave Shift Register](#).

When transmitting several characters in one SPI transaction, the data has to be written into DATA register with at least three SCK clock cycles left in the current character transmission. If this criteria is not met, the previously received character will be transmitted.

Once the DATA register is empty, it takes three CLK\_SERCOM\_APB cycles for INTFLAG.DRE to be set.

#### 26.6.2.7. Receiver Error Bit

The SPI receiver has one error bit: the Buffer Overflow bit (BUFOVF), which can be read from the Status register (STATUS). Once an error happens, the bit will stay set until it is cleared by writing '1' to it. The bit is also automatically cleared when the receiver is disabled.

There are two methods for buffer overflow notification, selected by the immediate buffer overflow notification bit in the Control A register (CTRLA.IBON):

If CTRLA.IBON=1, STATUS.BUFOVF is raised immediately upon buffer overflow. Software can then empty the receive FIFO by reading RxDATA until the receiver complete interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG.RXC) goes low.

If CTRLA.IBON=0, the buffer overflow condition travels with data through the receive FIFO. After the received data is read, STATUS.BUFOVF will be set along with INTFLAG.RXC, and RxDATA will be zero.

### 26.6.3. Additional Features

#### 26.6.3.1. Address Recognition

When the SPI is configured for slave operation (CTRLA.MODE=0x2) with address recognition (CTRLA.FORM is 0x2), the SERCOM address recognition logic is enabled: the first character in a transaction is checked for an address match.

If there is a match, the Receive Complete Interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG.RXC) is set, the MISO output is enabled, and the transaction is processed. If the device is in sleep mode, an address match can wake up the device in order to process the transaction.

If there is no match, the complete transaction is ignored.

If a 9-bit frame format is selected, only the lower 8 bits of the shift register are checked against the Address register (ADDR).

Preload must be disabled (CTRLB.PLOADEN=0) in order to use this mode.

#### Related Links

[Address Match and Mask](#) on page 375

##### 26.6.3.2. Preloading of the Slave Shift Register

When starting a transaction, the slave will first transmit the contents of the shift register before loading new data from DATA. The first character sent can be either the reset value of the shift register (if this is the first transmission since the last reset) or the last character in the previous transmission.

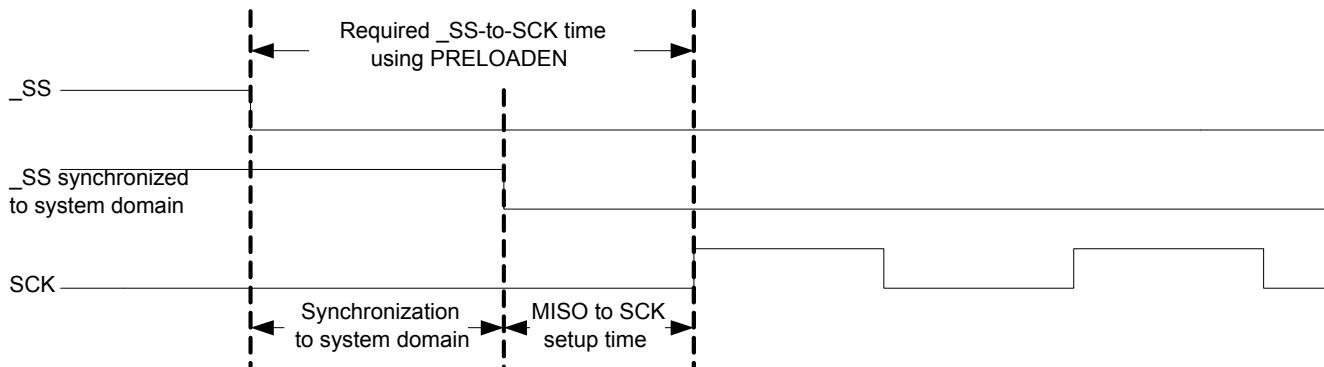

Preloading can be used to preload data into the shift register while  $\overline{SS}$  is high: this eliminates sending a dummy character when starting a transaction. If the shift register is not preloaded, the current contents of the shift register will be shifted out.

Only one data character will be preloaded into the shift register while the synchronized  $\overline{SS}$  signal is high. If the next character is written to DATA before  $\overline{SS}$  is pulled low, the second character will be stored in DATA until transfer begins.

For proper preloading, sufficient time must elapse between  $\overline{SS}$  going low and the first SCK sampling edge, as in [Timing Using Preloading](#). See also *Electrical Characteristics* for timing details.

Preloading is enabled by writing '1' to the Slave Data Preload Enable bit in the CTRLB register (CTRLB.PLOADEN).

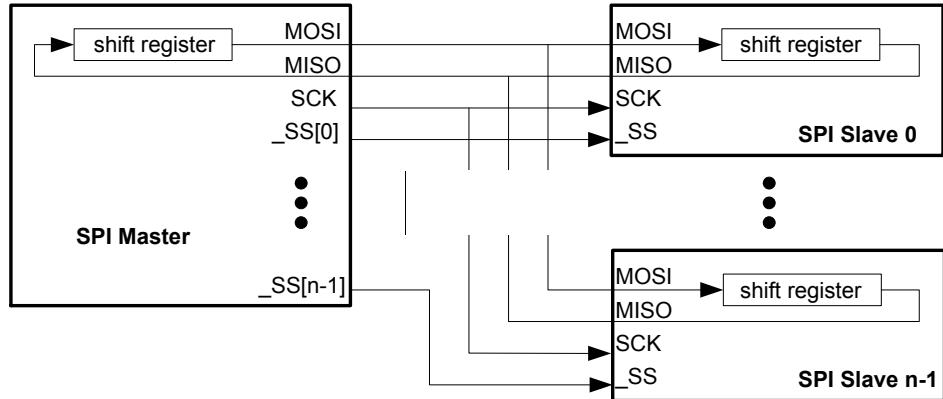

**Figure 26-4. Timing Using Preloading**

##### 26.6.3.3. Master with Several Slaves

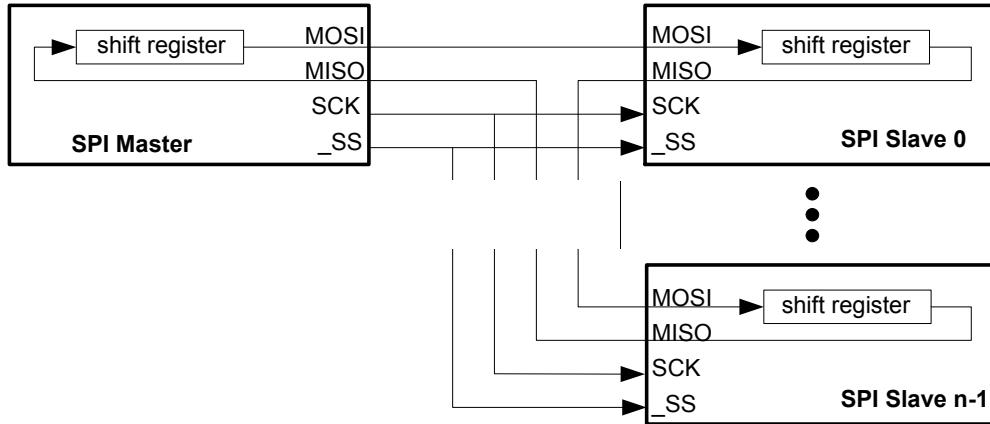

Master with multiple slaves in parallel is only available when Master Slave Select Enable (CTRLB.MSSEN) is set to zero and hardware  $\overline{SS}$  control is disabled. If the bus consists of several SPI slaves, an SPI master can use general purpose I/O pins to control the  $\overline{SS}$  line to each of the slaves on the bus, as shown in [Multiple Slaves in Parallel](#). In this configuration, the single selected SPI slave will drive the tri-state MISO line.

**Figure 26-5. Multiple Slaves in Parallel**

Another configuration is multiple slaves in series, as in [Multiple Slaves in Series](#). In this configuration, all  $n$  attached slaves are connected in series. A common  $\overline{SS}$  line is provided to all slaves, enabling them simultaneously. The master must shift  $n$  characters for a complete transaction. Depending on the Master Slave Select Enable bit (CTRLB.MSSEN), the  $\overline{SS}$  line can be controlled either by hardware or user software and normal GPIO.

**Figure 26-6. Multiple Slaves in Series**

#### 26.6.3.4. Loop-Back Mode

For loop-back mode, configure the Data In Pinout (CTRLA.DIPO) and Data Out Pinout (CTRLA.DOPO) to use the same data pins for transmit and receive. The loop-back is through the pad, so the signal is also available externally.

#### 26.6.4. Interrupts

The SPI has the following interrupt sources. These are asynchronous interrupts, and can wake up the device from any sleep mode:

- Data Register Empty (DRE)
- Receive Complete (RXC)
- Transmit Complete (TXC)

Each interrupt source has its own interrupt flag. The interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG) will be set when the interrupt condition is met. Each interrupt can be individually enabled by writing '1' to the corresponding bit in the Interrupt Enable Set register (INTENSET), and disabled by writing '1' to the corresponding bit in the Interrupt Enable Clear register (INTENCLR).

An interrupt request is generated when the interrupt flag is set and if the corresponding interrupt is enabled. The interrupt request remains active until either the interrupt flag is cleared, the interrupt is disabled, or the SPI is reset. For details on clearing interrupt flags, refer to the INTFLAG register description.

The SPI has one common interrupt request line for all the interrupt sources. The value of INTFLAG indicates which interrupt is executed. Note that interrupts must be globally enabled for interrupt requests. Refer to *Nested Vector Interrupt Controller* for details.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 26.6.5. Sleep Mode Operation

The behavior in sleep mode is depending on the master/slave configuration and the Run In Standby bit in the Control A register (CTRLA.RUNSTDBY):

- Master operation, CTRLA.RUNSTDBY=1: The peripheral clock GCLK\_SERCOM\_CORE will continue to run in idle sleep mode and in standby sleep mode. Any interrupt can wake up the device.
- Master operation, CTRLA.RUNSTDBY=0: GLK\_SERCOMx\_CORE will be disabled after the ongoing transaction is finished. Any interrupt can wake up the device.
- Slave operation, CTRLA.RUNSTDBY=1: The Receive Complete interrupt can wake up the device.
- Slave operation, CTRLA.RUNSTDBY=0: All reception will be dropped, including the ongoing transaction.

### 26.6.6. Synchronization

Due to asynchronicity between the main clock domain and the peripheral clock domains, some registers need to be synchronized when written or read.

The following bits are synchronized when written:

- Software Reset bit in the CTRLA register (CTRLA.SWRST)
- Enable bit in the CTRLA register (CTRLA.ENABLE)
- Receiver Enable bit in the CTRLB register (CTRLB.RXEN)

**Note:** CTRLB.RXEN is write-synchronized somewhat differently. See also *CTRLB* register for details.

Required write-synchronization is denoted by the "Write-Synchronized" property in the register description.

## 26.8. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16-, and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers require synchronization when read and/or written. Synchronization is denoted by the "Read-Synchronized" and/or "Write-Synchronized" property in each individual register description.

Refer to [Synchronization](#)

Some registers are enable-protected, meaning they can only be written when the module is disabled. Enable-protection is denoted by the "Enable-Protected" property in each individual register description.

Optional write-protection by the Peripheral Access Controller (PAC) is denoted by the "PAC Write-Protection" property in each individual register description.

Refer to [Register Access Protection](#).

### 26.8.1. Control A

**Name:** CTRLA

**Offset:** 0x00

**Reset:** 0x00000000

**Property:** PAC Write-Protection, Enable-Protected, Write-Synchronized

Bit	31	30	29	28	27	26	25	24

#### Bit 30 – DORD: Data Order

This bit selects the data order when a character is shifted out from the shift register.

This bit is not synchronized.

Value	Description
0	MSB is transferred first.
1	LSB is transferred first.

#### Bit 29 – CPOL: Clock Polarity

In combination with the Clock Phase bit (CPHA), this bit determines the SPI transfer mode.

This bit is not synchronized.

Value	Description
0	SCK is low when idle. The leading edge of a clock cycle is a rising edge, while the trailing edge is a falling edge.
1	SCK is high when idle. The leading edge of a clock cycle is a falling edge, while the trailing edge is a rising edge.

#### Bit 28 – CPHA: Clock Phase

In combination with the Clock Polarity bit (CPOL), this bit determines the SPI transfer mode.

This bit is not synchronized.

Mode	CPOL	CPHA	Leading Edge	Trailing Edge
0x0	0	0	Rising, sample	Falling, change
0x1	0	1	Rising, change	Falling, sample
0x2	1	0	Falling, sample	Rising, change
0x3	1	1	Falling, change	Rising, sample

Value	Description
0	The data is sampled on a leading SCK edge and changed on a trailing SCK edge.
1	The data is sampled on a trailing SCK edge and changed on a leading SCK edge.

#### Bits 27:24 – FORM[3:0]: Frame Format

This bit field selects the various frame formats supported by the SPI in slave mode. When the 'SPI frame with address' format is selected, the first byte received is checked against the ADDR register.

FORM[3:0]	Name	Description
0x0	SPI	SPI frame
0x1	-	Reserved
0x2	SPI_ADDR	SPI frame with address
0x3-0xF	-	Reserved

#### Bits 21:20 – DIPO[1:0]: Data In Pinout

These bits define the data in (DI) pad configurations.

In master operation, DI is MISO.

In slave operation, DI is MOSI.

These bits are not synchronized.

DIPO[1:0]	Name	Description
0x0	PAD[0]	SERCOM PAD[0] is used as data input
0x1	PAD[1]	SERCOM PAD[1] is used as data input
0x2	PAD[2]	SERCOM PAD[2] is used as data input
0x3	PAD[3]	SERCOM PAD[3] is used as data input

#### Bits 17:16 – DOPO[1:0]: Data Out Pinout

This bit defines the available pad configurations for data out (DO) and the serial clock (SCK). In slave operation, the slave select line ( $\overline{SS}$ ) is controlled by DOPO, while in master operation the  $\overline{SS}$  line is controlled by the port configuration.

In master operation, DO is MOSI.

In slave operation, DO is MISO.

These bits are not synchronized.

<b>DOPO</b>	<b>DO</b>	<b>SCK</b>	<b>Slave SS</b>	<b>Master SS</b>
0x0	PAD[0]	PAD[1]	PAD[2]	System configuration
0x1	PAD[2]	PAD[3]	PAD[1]	System configuration
0x2	PAD[3]	PAD[1]	PAD[2]	System configuration
0x3	PAD[0]	PAD[3]	PAD[1]	System configuration

#### **Bit 8 – IBON: Immediate Buffer Overflow Notification**

This bit controls when the buffer overflow status bit (STATUS.BUFOVF) is set when a buffer overflow occurs.

This bit is not synchronized.

<b>Value</b>	<b>Description</b>
0	STATUS.BUFOVF is set when it occurs in the data stream.
1	STATUS.BUFOVF is set immediately upon buffer overflow.

#### **Bit 7 – RUNSTDBY: Run In Standby**

This bit defines the functionality in standby sleep mode.

These bits are not synchronized.

<b>RUNSTDBY</b>	<b>Slave</b>	<b>Master</b>
0x0	Disabled. All reception is dropped, including the ongoing transaction.	Generic clock is disabled when ongoing transaction is finished. All interrupts can wake up the device.
0x1	Ongoing transaction continues, wake on Receive Complete interrupt.	Generic clock is enabled while in sleep modes. All interrupts can wake up the device.

#### **Bits 4:2 – MODE[2:0]: Operating Mode**

These bits must be written to 0x2 or 0x3 to select the SPI serial communication interface of the SERCOM.

0x2: SPI slave operation

0x3: SPI master operation

These bits are not synchronized.

#### **Bit 1 – ENABLE: Enable**

Due to synchronization, there is delay from writing CTRLA.ENABLE until the peripheral is enabled/disabled. The value written to CTRLA.ENABLE will read back immediately and the Synchronization Enable Busy bit in the Synchronization Busy register (SYNCBUSY.ENABLE) will be set. SYNCBUSY.ENABLE is cleared when the operation is complete.

This bit is not enable-protected.

<b>Value</b>	<b>Description</b>
0	The peripheral is disabled or being disabled.
1	The peripheral is enabled or being enabled.

### **Bit 0 – SWRST: Software Reset**

Writing '0' to this bit has no effect.

Writing '1' to this bit resets all registers in the SERCOM, except DBGCTRL, to their initial state, and the SERCOM will be disabled.

Writing "1" to CTRL.SWRST will always take precedence, meaning that all other writes in the same write-operation will be discarded. Any register write access during the ongoing reset will result in an APB error. Reading any register will return the reset value of the register.

Due to synchronization, there is a delay from writing CTRLA.SWRST until the reset is complete. CTRLA.SWRST and SYNCBUSY.SWRST will both be cleared when the reset is complete.

This bit is not enable-protected.

Value	Description
0	There is no reset operation ongoing.
1	The reset operation is ongoing.

## 26.8.2. Control B

**Name:** CTRLB  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** PAC Write-Protection, Enable-Protected

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access							R/W	
Reset							0	
Bit	15	14	13	12	11	10	9	8
Access	R/W	R/W						
Reset	0	0						
Bit	7	6	5	4	3	2	1	0
Access		R/W				R/W	R/W	R/W
Reset		0				0	0	0

### Bit 17 – RXEN: Receiver Enable

Writing '0' to this bit will disable the SPI receiver immediately. The receive buffer will be flushed, data from ongoing receptions will be lost and STATUS.BUFOVF will be cleared.

Writing '1' to CTRLB.RXEN when the SPI is disabled will set CTRLB.RXEN immediately. When the SPI is enabled, CTRLB.RXEN will be cleared, SYNCBUSY.CTRLB will be set and remain set until the receiver is enabled. When the receiver is enabled CTRLB.RXEN will read back as '1'.

Writing '1' to CTRLB.RXEN when the SPI is enabled will set SYNCBUSY.CTRLB, which will remain set until the receiver is enabled, and CTRLB.RXEN will read back as '1'.

This bit is not enable-protected.

Value	Description
0	The receiver is disabled or being enabled.
1	The receiver is enabled or it will be enabled when SPI is enabled.

### Bits 15:14 – AMODE[1:0]: Address Mode

These bits set the slave addressing mode when the frame format (CTRLA.FORM) with address is used. They are unused in master mode.

AMODE[1:0]	Name	Description
0x0	MASK	ADDRMASK is used as a mask to the ADDR register
0x1	2_ADDRS	The slave responds to the two unique addresses in ADDR and ADDRMASK
0x2	RANGE	The slave responds to the range of addresses between and including ADDR and ADDRMASK. ADDR is the upper limit
0x3	-	Reserved

#### Bit 6 – PLOADEN: Slave Data Preload Enable

Setting this bit will enable preloading of the slave shift register when there is no transfer in progress. If the SS line is high when DATA is written, it will be transferred immediately to the shift register.

#### Bits 2:0 – CHSIZE[2:0]: Character Size

CHSIZE[2:0]	Name	Description
0x0	8BIT	8 bits
0x1	9BIT	9 bits
0x2-0x7	-	Reserved

### 26.8.3. Debug Control

**Name:** DBGCTRL  
**Offset:** 0x08  
**Reset:** 0x00  
**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access								DBGSTOP
Reset								0

#### Bit 0 – DBGSTOP: Debug Stop Mode

This bit controls the functionality when the CPU is halted by an external debugger.

Value	Description
0	The baud-rate generator continues normal operation when the CPU is halted by an external debugger.
1	The baud-rate generator is halted when the CPU is halted by an external debugger.

#### 26.8.4. Baud Rate

**Name:** BAUD  
**Offset:** 0x0A  
**Reset:** 0x00  
**Property:** PAC Write-Protection, Enable-Protected

Bit	7	6	5	4	3	2	1	0
BAUD[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 7:0 – BAUD[7:0]: Baud Register

These bits control the clock generation, as described in the *SERCOM Clock Generation – Baud-Rate Generator*.

### 26.8.5. Interrupt Enable Clear

**Name:** INTENCLR  
**Offset:** 0x0C  
**Reset:** 0x00  
**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access						RXC	TXC	DRE
Reset						0	0	0

#### Bit 2 – RXC: Receive Complete Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Receive Complete Interrupt Enable bit, which disables the Receive Complete interrupt.

Value	Description
0	Receive Complete interrupt is disabled.
1	Receive Complete interrupt is enabled.

#### Bit 1 – TXC: Transmit Complete Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Transmit Complete Interrupt Enable bit, which disable the Transmit Complete interrupt.

Value	Description
0	Transmit Complete interrupt is disabled.
1	Transmit Complete interrupt is enabled.

#### Bit 0 – DRE: Data Register Empty Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Data Register Empty Interrupt Enable bit, which disables the Data Register Empty interrupt.

Value	Description
0	Data Register Empty interrupt is disabled.
1	Data Register Empty interrupt is enabled.

## 26.8.6. Interrupt Enable Set

**Name:** INTENSET  
**Offset:** 0x0D  
**Reset:** 0x00  
**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access						RXC	TXC	DRE
Reset						0	0	0

### Bit 2 – RXC: Receive Complete Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will set the Receive Complete Interrupt Enable bit, which enables the Receive Complete interrupt.

Value	Description
0	Receive Complete interrupt is disabled.
1	Receive Complete interrupt is enabled.

### Bit 1 – TXC: Transmit Complete Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will set the Transmit Complete Interrupt Enable bit, which enables the Transmit Complete interrupt.

Value	Description
0	Transmit Complete interrupt is disabled.
1	Transmit Complete interrupt is enabled.

### Bit 0 – DRE: Data Register Empty Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will set the Data Register Empty Interrupt Enable bit, which enables the Data Register Empty interrupt.

Value	Description
0	Data Register Empty interrupt is disabled.
1	Data Register Empty interrupt is enabled.

## 26.8.7. Interrupt Flag Status and Clear

**Name:** INTFLAG

**Offset:** 0x0E

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0
Access						RXC	TXC	DRE
Reset						0	0	0

### Bit 2 – RXC: Receive Complete

This flag is cleared by reading the Data (DATA) register or by disabling the receiver.

This flag is set when there are unread data in the receive buffer. If address matching is enabled, the first data received in a transaction will be an address.

Writing '0' to this bit has no effect.

Writing '1' to this bit has no effect.

### Bit 1 – TXC: Transmit Complete

This flag is cleared by writing '1' to it or by writing new data to DATA.

In master mode, this flag is set when the data have been shifted out and there are no new data in DATA.

In slave mode, this flag is set when the \_SS pin is pulled high. If address matching is enabled, this flag is only set if the transaction was initiated with an address match.

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the flag.

### Bit 0 – DRE: Data Register Empty

This flag is cleared by writing new data to DATA.

This flag is set when DATA is empty and ready for new data to transmit.

Writing '0' to this bit has no effect.

Writing '1' to this bit has no effect.

## 26.8.8. Status

**Name:** STATUS

**Offset:** 0x10

**Reset:** 0x0000

**Property:** –

Bit	15	14	13	12	11	10	9	8
	SYNCBUSY							
Access	R/W							
Reset	0							
Bit	7	6	5	4	3	2	1	0
						BUFOVF		
Access						R/W		
Reset						0		

### Bit 15 – SYNCBUSY: Synchronization Busy

This bit is cleared when the synchronization of registers between the clock domains is complete.

This bit is set when the synchronization of registers between clock domains is in progress.

### Bit 2 – BUFOVF: Buffer Overflow

Reading this bit before reading DATA will indicate the error status of the next character to be read.

This bit is cleared by writing '1' to the bit or by disabling the receiver.

This bit is set when a buffer overflow condition is detected. See also [CTRLA.IBON](#) for overflow handling.

When set, the corresponding RxDATA will be zero.

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear it.

Value	Description
0	No Buffer Overflow has occurred.
1	A Buffer Overflow has occurred.

## 26.8.9. Address

**Name:** ADDR  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** PAC Write-Protection, Enable-Protected

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
ADDRMASK[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
ADDR[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

### Bits 23:16 – ADDRMASK[7:0]: Address Mask

These bits hold the address mask when the transaction format with address is used (CTRLA.FORM, CTRLB.AMODE).

### Bits 7:0 – ADDR[7:0]: Address

These bits hold the address when the transaction format with address is used (CTRLA.FORM, CTRLB.AMODE).

### 26.8.10. Data

**Name:** DATA  
**Offset:** 0x18  
**Reset:** 0x0000  
**Property:** –

Bit	15	14	13	12	11	10	9	8
								DATA[8:8]
Access								R/W
Reset								0
Bit	7	6	5	4	3	2	1	0
								DATA[7:0]
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 8:0 – DATA[8:0]: Data

Reading these bits will return the contents of the receive data buffer. The register should be read only when the Receive Complete Interrupt Flag bit in the Interrupt Flag Status and Clear register (INTFLAG.RXC) is set.

Writing these bits will write the transmit data buffer. This register should be written only when the Data Register Empty Interrupt Flag bit in the Interrupt Flag Status and Clear register (INTFLAG.DRE) is set.

## 27. SERCOM I<sup>2</sup>C – SERCOM Inter-Integrated Circuit

### 27.1. Overview

The inter-integrated circuit (I<sup>2</sup>C) interface is one of the available modes in the serial communication interface (SERCOM).

The I<sup>2</sup>C interface uses the SERCOM transmitter and receiver configured as shown in [Figure 27.1](#). Labels in capital letters are registers accessible by the CPU, while lowercase labels are internal to the SERCOM. Each master and slave have a separate I<sup>2</sup>C interface containing a shift register, a transmit buffer and a receive buffer. In addition, the I<sup>2</sup>C master uses the SERCOM baud-rate generator, while the I<sup>2</sup>C slave uses the SERCOM address match logic.

#### Related Links

[SERCOM – Serial Communication Interface](#) on page 369

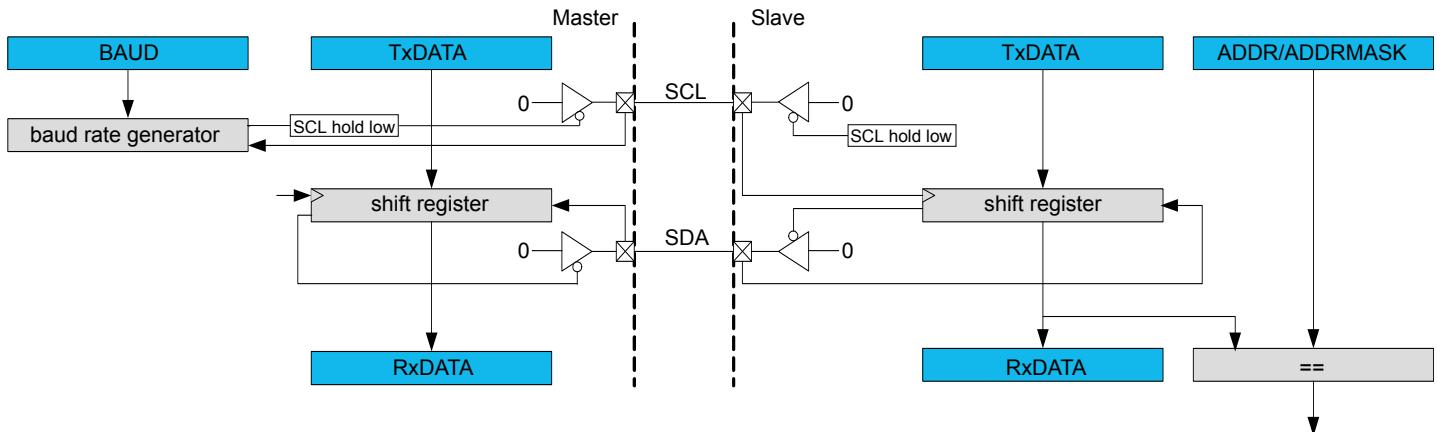

### 27.2. Features

SERCOM I<sup>2</sup>C includes the following features:

- Master or slave operation
- Can be used with DMA
- Philips I<sup>2</sup>C compatible
- SMBus™ compatible
- Support of 100kHz and 400kHz I<sup>2</sup>C mode low system clock frequencies
- Physical interface includes:
  - Slew-rate limited outputs
  - Filtered inputs
- Slave operation:
  - Operation in all sleep modes
  - Wake-up on address match
  - 7-bit and 10-bit Address match in hardware for:
    - Unique address and/or 7-bit general call address
    - Address range
    - Two unique addresses

### 27.3. Block Diagram

Figure 27-1. I<sup>2</sup>C Single-Master Single-Slave Interconnection

### 27.4. Signal Description

Signal Name	Type	Description
PAD[0]	Digital I/O	SDA
PAD[1]	Digital I/O	SCL
PAD[2]	Digital I/O	SDA_OUT (4-wire)
PAD[3]	Digital I/O	SDC_OUT (4-wire)

One signal can be mapped on several pins.

Not all the pins are I<sup>2</sup>C pins.

#### Related Links

[I/O Multiplexing and Considerations](#) on page 27

### 27.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly, as described below.

#### 27.5.1. I/O Lines

In order to use the I/O lines of this peripheral, the I/O pins must be configured using the I/O Pin Controller (PORT).

When the SERCOM is used in I<sup>2</sup>C mode, the SERCOM controls the direction and value of the I/O pins. Both PORT control bits PINCFGn.PULLEN and PINCFGn.DRVSTR are still effective. If the receiver or transmitter is disabled, these pins can be used for other purposes.

#### Related Links

[PORT: IO Pin Controller](#) on page 320

#### 27.5.2. Power Management

This peripheral can continue to operate in any sleep mode where its source clock is running. The interrupts can wake up the device from sleep modes.

## Related Links

[PM – Power Manager](#) on page 129

### 27.5.3. Clocks

The SERCOM bus clock (CLK\_SERCOMx\_APB) is enabled by default, and can be enabled and disabled in the Main Clock Controller and the Power Manager.

Two generic clocks are used by SERCOM, GCLK\_SERCOMx\_CORE and GCLK\_SERCOM\_SLOW. The core clock (GCLK\_SERCOMx\_CORE) can clock the I<sup>2</sup>C when working as a master. The slow clock (GCLK\_SERCOM\_SLOW) is required only for certain functions, e.g. SMBus timing. These clocks must be configured and enabled in the Generic Clock Controller (GCLK) before using the I<sup>2</sup>C.

These generic clocks are asynchronous to the bus clock (CLK\_SERCOMx\_APB). Due to this asynchronicity, writes to certain registers will require synchronization between the clock domains. Refer to [Synchronization](#) for further details.

## Related Links

[GCLK - Generic Clock Controller](#) on page 108

[PM – Power Manager](#) on page 129

### 27.5.4. Interrupts

The interrupt request line is connected to the Interrupt Controller. In order to use interrupt requests of this peripheral, the Interrupt Controller (NVIC) must be configured first. Refer to *Nested Vector Interrupt Controller* for details.

## Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 27.5.5. Events

Not applicable.

### 27.5.6. Debug Operation

When the CPU is halted in debug mode, this peripheral will continue normal operation. If the peripheral is configured to require periodical service by the CPU through interrupts or similar, improper operation or data loss may result during debugging. This peripheral can be forced to halt operation during debugging - refer to the Debug Control (DBGCTRL) register for details.

## Related Links

[DBGCTRL](#) on page 469

### 27.5.7. Register Access Protection

Registers with write-access can be write-protected optionally by the peripheral access controller (PAC).

PAC Write-Protection is not available for the following registers:

- Interrupt Flag Clear and Status register (INTFLAG)
- Status register (STATUS)
- Data register (DATA)
- Address register (ADDR)

Optional PAC Write-Protection is denoted by the "PAC Write-Protection" property in each individual register description.

Write-protection does not apply to accesses through an external debugger.

## Related Links

PAC - Peripheral Access Controller on page 45

### 27.5.8. Analog Connections

Not applicable.

## 27.6. Functional Description

### 27.6.1. Principle of Operation

The I<sup>2</sup>C interface uses two physical lines for communication:

- Serial Data Line (SDA) for packet transfer
- Serial Clock Line (SCL) for the bus clock

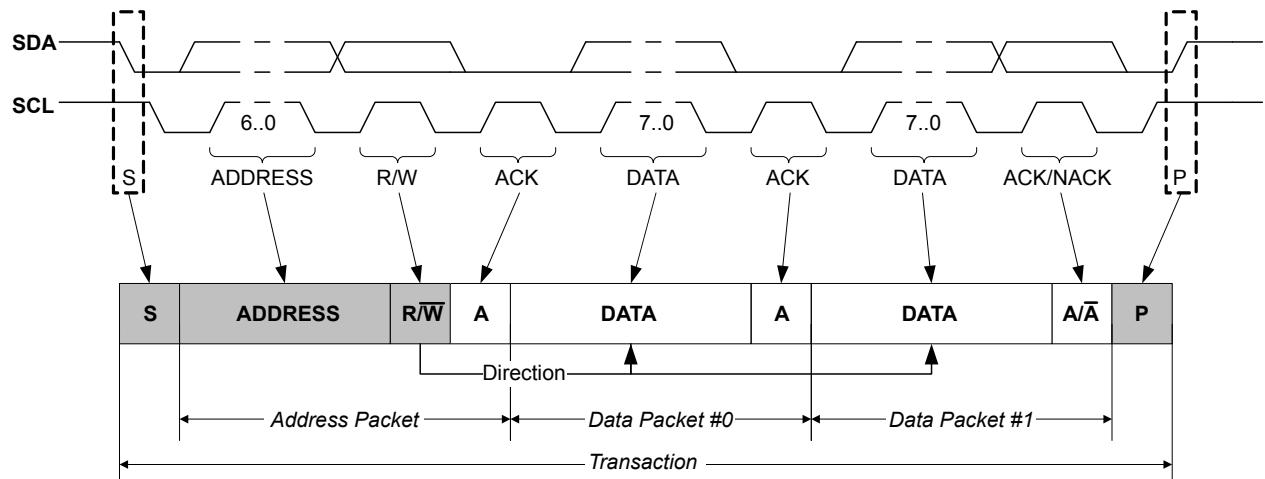

A transaction starts with the I<sup>2</sup>C master sending the start condition, followed by a 7-bit address and a direction bit (read or write to/from the slave).

The addressed I<sup>2</sup>C slave will then acknowledge (ACK) the address, and data packet transactions can begin. Every 9-bit data packet consists of 8 data bits followed by a one-bit reply indicating whether the data was acknowledged or not.

If a data packet is not acknowledged (NACK), whether by the I<sup>2</sup>C slave or master, the I<sup>2</sup>C master takes action by either terminating the transaction by sending the stop condition, or by sending a repeated start to transfer more data.

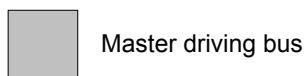

The figure below illustrates the possible transaction formats and [Transaction Diagram Symbols](#) explains the transaction symbols. These symbols will be used in the following descriptions.

Figure 27-2. Basic I<sup>2</sup>C Transaction Diagram

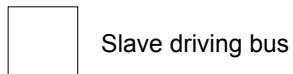

## Transaction Diagram Symbols

Master Write

'0'

### Acknowledge

Acknowledge (ACK)

'0'

Not Acknowledge (NACK)

'1'

## 27.6.2. Basic Operation

### 27.6.2.1. Initialization

The following registers are enable-protected, meaning they can be written only when the I<sup>2</sup>C interface is disabled (CTRLA.ENABLE is '0'):

- Control A register (CTRLA), except Enable (CTRLA.ENABLE) and Software Reset (CTRLA.SWRST) bits
- Control B register (CTRLB), except Acknowledge Action (CTRLB.ACKACT) and Command (CTRLB.CMD) bits
- Baud register (BAUD)
- Address register (ADDR) in slave operation.

When the I<sup>2</sup>C is enabled or is being enabled (CTRLA.ENABLE=1), writing to these registers will be discarded. If the I<sup>2</sup>C is being disabled, writing to these registers will be completed after the disabling.

Enable-protection is denoted by the "Enable-Protection" property in the register description.

Before the I<sup>2</sup>C is enabled it must be configured as outlined by the following steps:

1. Select I<sup>2</sup>C Master or Slave mode by writing 0x4 or 0x5 to the Operating Mode bits in the CTRLA register (CTRLA.MODE).
2. If desired, select the SDA Hold Time value in the CTRLA register (CTRLA.SDAHOLD).
3. If desired, enable smart operation by setting the Smart Mode Enable bit in the CTRLB register (CTRLB.SMEN).
4. If desired, enable SCL low time-out by setting the SCL Low Time-Out bit in the Control A register (CTRLA.LOWTOUT).
5. In Master mode:
  - 5.1. Select the inactive bus time-out in the Inactive Time-Out bit group in the CTRLA register (CTRLA.INACTOUT).
  - 5.2. Write the Baud Rate register (BAUD) to generate the desired baud rate.

In Slave mode:

- 5.1. Configure the address match configuration by writing the Address Mode value in the CTRLB register (CTRLB.AMODE).
- 5.2. Set the Address and Address Mask value in the Address register (ADDR.ADDR and ADDR.ADDRMASK) according to the address configuration.

#### 27.6.2.2. Enabling, Disabling, and Resetting

This peripheral is enabled by writing '1' to the Enable bit in the Control A register (CTRLA.ENABLE), and disabled by writing '0' to it.

Refer to CTRLA register for details.

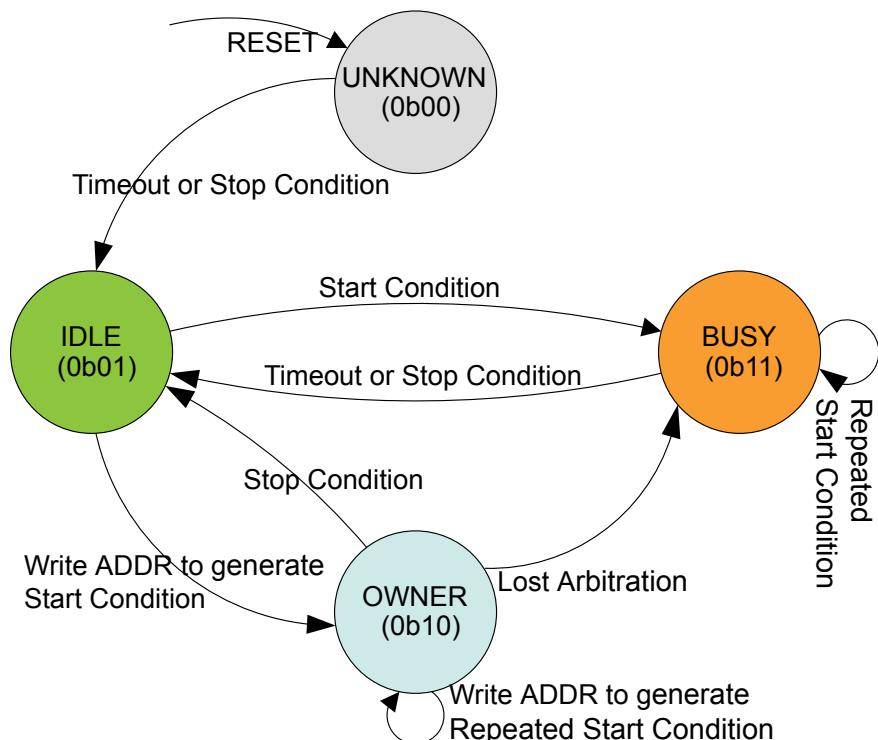

#### Related Links

[CTRLA](#) on page 464

#### 27.6.2.3. I<sup>2</sup>C Bus State Logic

The bus state logic includes several logic blocks that continuously monitor the activity on the I<sup>2</sup>C bus lines in all sleep modes. The start and stop detectors and the bit counter are all essential in the process of determining the current bus state. The bus state is determined according to [Bus State Diagram](#). Software can get the current bus state by reading the Master Bus State bits in the Status register (STATUS.BUSSTATE). The value of STATUS.BUSSTATE in the figure is shown in binary.

Figure 27-3. Bus State Diagram

The bus state machine is active when the I<sup>2</sup>C master is enabled.

After the I<sup>2</sup>C master has been enabled, the bus state is UNKNOWN (0b00). From the UNKNOWN state, the bus will transition to IDLE (0b01) by either:

- Forcing by writing 0b01 to STATUS.BUSSTATE
- A stop condition is detected on the bus
- If the inactive bus time-out is configured for SMBus compatibility (CTRLA.INACTOUT) and a time-out occurs.

**Note:** Once a known bus state is established, the bus state logic will not re-enter the UNKNOWN state.

When the bus is IDLE it is ready for a new transaction. If a start condition is issued on the bus by another I<sup>2</sup>C master in a multi-master setup, the bus becomes BUSY (0b11). The bus will re-enter IDLE either when a stop condition is detected, or when a time-out occurs (inactive bus time-out needs to be configured).

If a start condition is generated internally by writing the Address bit group in the Address register (ADDR.ADDR) while IDLE, the OWNER state (0b10) is entered. If the complete transaction was performed without interference, i.e., arbitration was not lost, the I<sup>2</sup>C master can issue a stop condition, which will change the bus state back to IDLE.

However, if a packet collision is detected while in OWNER state, the arbitration is assumed lost and the bus state becomes BUSY until a stop condition is detected. A repeated start condition will change the bus state only if arbitration is lost while issuing a repeated start.

Regardless of winning or losing arbitration, the entire address will be sent. If arbitration is lost, only 'ones' are transmitted from the point of losing arbitration and the rest of the address length.

**Note:** Violating the protocol may cause the I<sup>2</sup>C to hang. If this happens it is possible to recover from this state by a software reset (CTRLA.SWRST='1').

#### Related Links

[CTRLA](#) on page 464

#### 27.6.2.4. I<sup>2</sup>C Master Operation

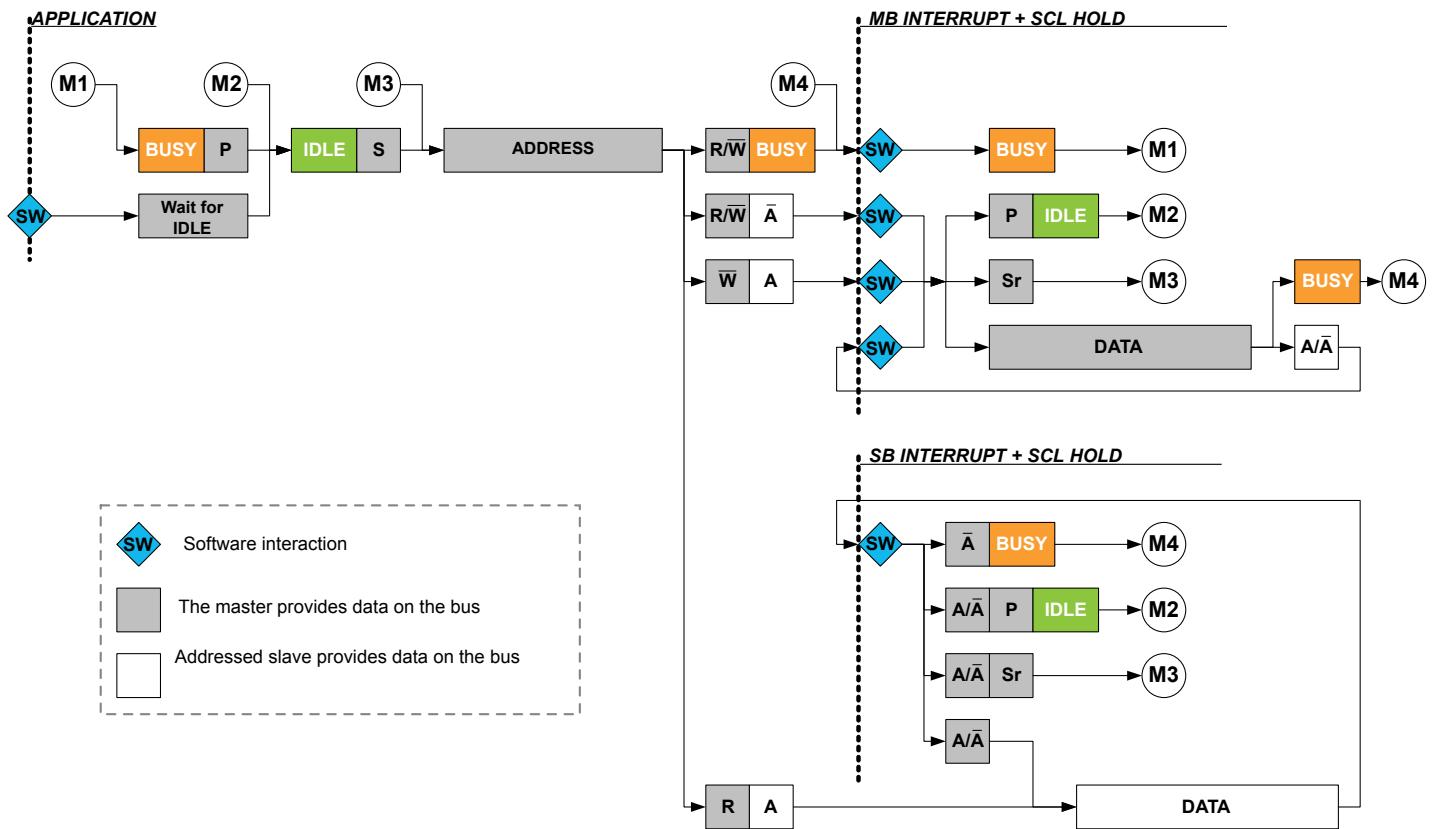

The I<sup>2</sup>C master is byte-oriented and interrupt based. The number of interrupts generated is kept at a minimum by automatic handling of most events. The software driver complexity and code size are reduced by auto-triggering of operations, and a special smart mode, which can be enabled by the Smart Mode Enable bit in the Control A register (CTRLA.SMEN).

The I<sup>2</sup>C master has two interrupt strategies.

When SCL Stretch Mode (CTRLA.SCLSM) is '0', SCL is stretched before or after the acknowledge bit . In this mode the I<sup>2</sup>C master operates according to [Master Behavioral Diagram \(SCLSM=0\)](#). The circles labelled "Mn" (M1, M2..) indicate the nodes the bus logic can jump to, based on software or hardware interaction.

This diagram is used as reference for the description of the I<sup>2</sup>C master operation throughout the document.

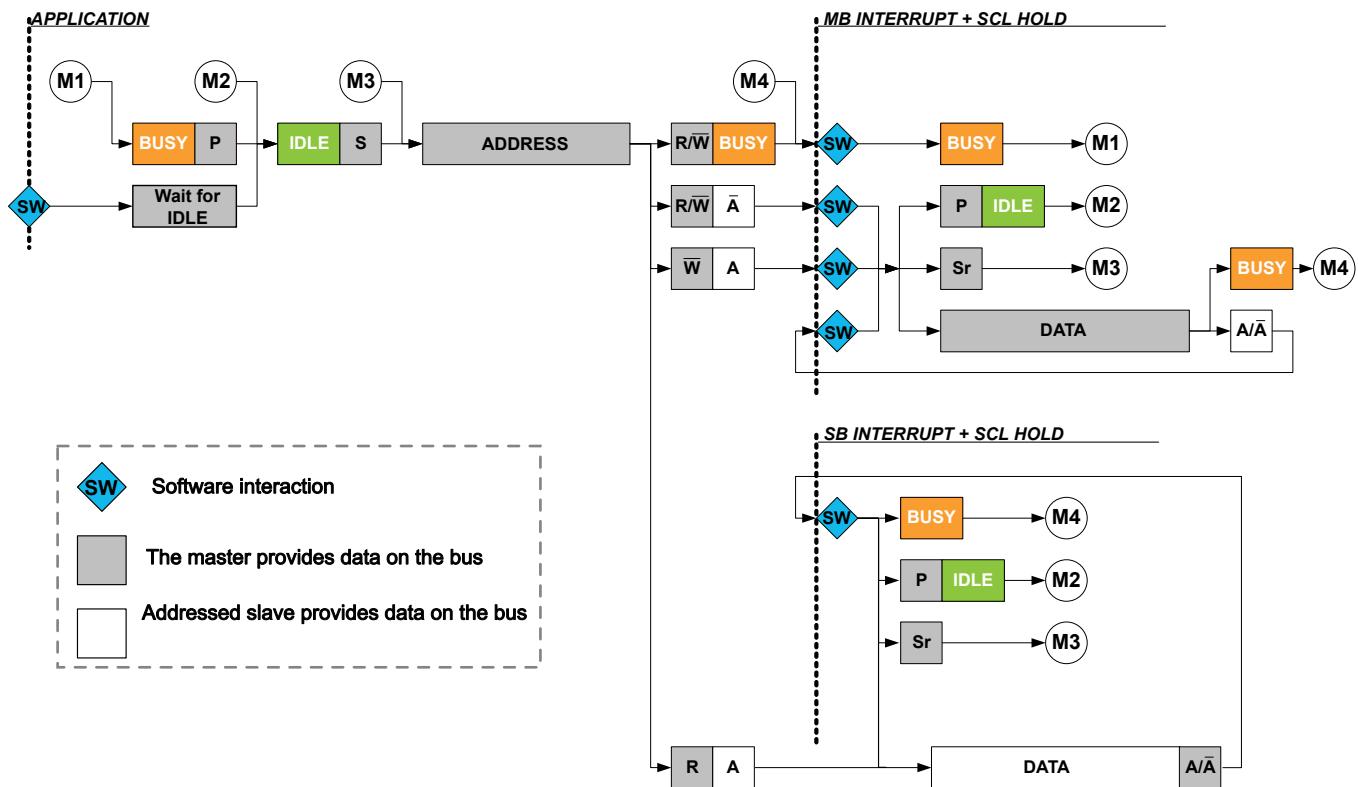

**Figure 27-4. I<sup>2</sup>C Master Behavioral Diagram (SCLSM=0)**

In the second strategy (CTRLA.SCLSM=1), interrupts only occur after the ACK bit, as in [Master Behavioral Diagram \(SCLSM=1\)](#). This strategy can be used when it is not necessary to check DATA before acknowledging.

**Note:** I<sup>2</sup>C High-speed (*Hs*) mode requires CTRLA.SCLSM=1.

Figure 27-5. I<sup>2</sup>C Master Behavioral Diagram (SCLSM=1)

### Master Clock Generation

The SERCOM peripheral supports several I<sup>2</sup>C bi-directional modes:

- Standard mode (*Sm*) up to 100kHz
- Fast mode (*Fm*) up to 400kHz
- Fast mode Plus (*Fm+*) up to 1MHz
- High-speed mode (*Hs*) up to 3.4MHz

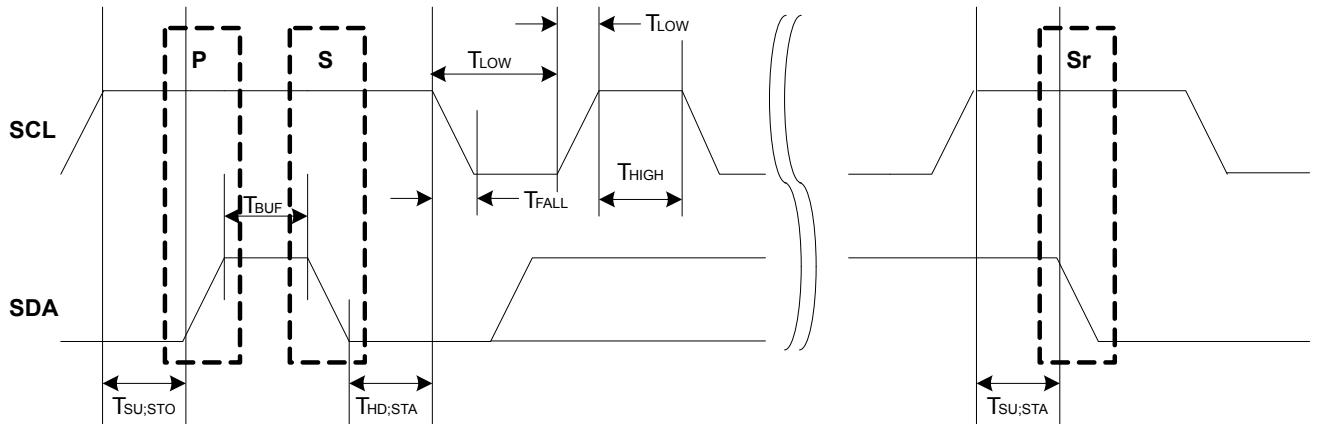

The Master clock configuration for *Sm*, *Fm*, and *Fm+* are described in [Clock Generation \(Standard-Mode, Fast-Mode, and Fast-Mode Plus\)](#). For *Hs*, refer to [Master Clock Generation \(High-Speed Mode\)](#).

### Clock Generation (Standard-Mode, Fast-Mode, and Fast-Mode Plus)

In I<sup>2</sup>C *Sm*, *Fm*, and *Fm+* mode, the Master clock (SCL) frequency is determined as described in this section:

The low ( $T_{LOW}$ ) and high ( $T_{HIGH}$ ) times are determined by the Baud Rate register (BAUD), while the rise ( $T_{RISE}$ ) and fall ( $T_{FALL}$ ) times are determined by the bus topology. Because of the wired-AND logic of the bus,  $T_{FALL}$  will be considered as part of  $T_{LOW}$ . Likewise,  $T_{RISE}$  will be in a state between  $T_{LOW}$  and  $T_{HIGH}$  until a high state has been detected.

**Figure 27-6. SCL Timing**

The following parameters are timed using the SCL low time period  $T_{LOW}$ . This comes from the Master Baud Rate Low bit group in the Baud Rate register (BAUD.BAUDLOW). When BAUD.BAUDLOW=0, or the Master Baud Rate bit group in the Baud Rate register (BAUD.BAUD) determines it.

- $T_{LOW}$  – Low period of SCL clock
- $T_{SU;STO}$  – Set-up time for stop condition
- $T_{BUFS}$  – Bus free time between stop and start conditions
- $T_{HD;STA}$  – Hold time (repeated) start condition
- $T_{SU;STA}$  – Set-up time for repeated start condition
- $T_{HIGH}$  is timed using the SCL high time count from BAUD.BAUD
- $T_{RISE}$  is determined by the bus impedance; for internal pull-ups. Refer to *Electrical Characteristics*.
- $T_{FALL}$  is determined by the open-drain current limit and bus impedance; can typically be regarded as zero. Refer to *Electrical Characteristics* for details.

The SCL frequency is given by:

$$f_{SCL} = \frac{1}{T_{LOW} + T_{HIGH} + T_{RISE}}$$

When BAUD.BAUDLOW is zero, the BAUD.BAUD value is used to time both SCL high and SCL low. In this case the following formula will give the SCL frequency:

$$f_{SCL} = \frac{f_{GCLK}}{10 + 2BAUD + f_{GCLK} \cdot T_{RISE}}$$

When BAUD.BAUDLOW is non-zero, the following formula determines the SCL frequency:

$$f_{SCL} = \frac{f_{GCLK}}{10 + BAUD + BAUDLOW + f_{GCLK} \cdot T_{RISE}}$$

The following formulas can determine the SCL  $T_{LOW}$  and  $T_{HIGH}$  times:

$$T_{LOW} = \frac{BAUDLOW + 5}{f_{GCLK}}$$

$$T_{HIGH} = \frac{BAUD + 5}{f_{GCLK}}$$

**Note:** The I<sup>2</sup>C standard Fm+ (Fast-mode plus) requires a nominal high to low SCL ratio of 1:2, and BAUD should be set accordingly. At a minimum, BAUD.BAUD and/or BAUD.BAUDLOW must be non-zero.

**Startup Timing** The minimum time between SDA transition and SCL rising edge is 6 APB cycles when the DATA register is written in smart mode. If a greater startup time is required due to long rise times, the time between DATA write and IF clear must be controlled by software.

**Note:** When timing is controlled by user, the Smart Mode cannot be enabled.

### **Master Clock Generation (High-Speed Mode)**

For I<sup>2</sup>C H<sub>s</sub> transfers, there is no SCL synchronization. Instead, the SCL frequency is determined by the GCLK\_SERCOMx\_CORE frequency ( $f_{GCLK}$ ) and the High-Speed Baud setting in the Baud register (BAUD.HSBAUD). When BAUD.HSBAUDLOW=0, the HSBAUD value will determine both SCL high and SCL low. In this case the following formula determines the SCL frequency.

$$f_{SCL} = \frac{f_{GCLK}}{2 + 2 \cdot HS\ BAUD}$$

When HSBAUDLOW is non-zero, the following formula determines the SCL frequency.

$$f_{SCL} = \frac{f_{GCLK}}{2 + HS\ BAUD + HSBAUDLOW}$$

**Note:** The I<sup>2</sup>C standard H<sub>s</sub> (High-speed) requires a nominal high to low SCL ratio of 1:2, and HSBAUD should be set accordingly. At a minimum, BAUD.HSBAUD and/or BAUD.HSBAUDLOW must be non-zero.

### **Transmitting Address Packets**

The I<sup>2</sup>C master starts a bus transaction by writing the I<sup>2</sup>C slave address to ADDR.ADDR and the direction bit, as described in [Principle of Operation](#). If the bus is busy, the I<sup>2</sup>C master will wait until the bus becomes idle before continuing the operation. When the bus is idle, the I<sup>2</sup>C master will issue a start condition on the bus. The I<sup>2</sup>C master will then transmit an address packet using the address written to ADDR.ADDR. After the address packet has been transmitted by the I<sup>2</sup>C master, one of four cases will arise according to arbitration and transfer direction.

#### **Case 1: Arbitration lost or bus error during address packet transmission**

If arbitration was lost during transmission of the address packet, the Master on Bus bit in the Interrupt Flag Status and Clear register (INTFLAG.MB) and the Arbitration Lost bit in the Status register (STATUS.ARBLOST) are both set. Serial data output to SDA is disabled, and the SCL is released, which disables clock stretching. In effect the I<sup>2</sup>C master is no longer allowed to execute any operation on the bus until the bus is idle again. A bus error will behave similarly to the arbitration lost condition. In this case, the MB interrupt flag and Master Bus Error bit in the Status register (STATUS.BUSERR) are both set in addition to STATUS.ARBLOST.

The Master Received Not Acknowledge bit in the Status register (STATUS.RXNACK) will always contain the last successfully received acknowledge or not acknowledge indication.

In this case, software will typically inform the application code of the condition and then clear the interrupt flag before exiting the interrupt routine. No other flags have to be cleared at this moment, because all flags will be cleared automatically the next time the ADDR.ADDR register is written.

#### **Case 2: Address packet transmit complete – No ACK received**

If there is no I<sup>2</sup>C slave device responding to the address packet, then the INTFLAG.MB interrupt flag and STATUS.RXNACK will be set. The clock hold is active at this point, preventing further activity on the bus.

The missing ACK response can indicate that the I<sup>2</sup>C slave is busy with other tasks or sleeping. Therefore, it is not able to respond. In this event, the next step can be either issuing a stop condition (recommended)

or resending the address packet by a repeated start condition. When using SMBus logic, the slave must ACK the address. If there is no response, it means that the slave is not available on the bus.

#### **Case 3: Address packet transmit complete – Write packet, Master on Bus set**

If the I<sup>2</sup>C master receives an acknowledge response from the I<sup>2</sup>C slave, INTFLAG.MB will be set and STATUS.RXNACK will be cleared. The clock hold is active at this point, preventing further activity on the bus.

In this case, the software implementation becomes highly protocol dependent. Three possible actions can enable the I<sup>2</sup>C operation to continue:

- Initiate a data transmit operation by writing the data byte to be transmitted into DATA.DATA.
- Transmit a new address packet by writing ADDR.ADDR. A repeated start condition will automatically be inserted before the address packet.
- Issue a stop condition, consequently terminating the transaction.

#### **Case 4: Address packet transmit complete – Read packet, Slave on Bus set**

If the I<sup>2</sup>C master receives an ACK from the I<sup>2</sup>C slave, the I<sup>2</sup>C master proceeds to receive the next byte of data from the I<sup>2</sup>C slave. When the first data byte is received, the Slave on Bus bit in the Interrupt Flag register (INTFLAG.SB) will be set and STATUS.RXNACK will be cleared. The clock hold is active at this point, preventing further activity on the bus.

In this case, the software implementation becomes highly protocol dependent. Three possible actions can enable the I<sup>2</sup>C operation to continue:

- Let the I<sup>2</sup>C master continue to read data by acknowledging the data received. ACK can be sent by software, or automatically in smart mode.
- Transmit a new address packet.
- Terminate the transaction by issuing a stop condition.

**Note:** An ACK or NACK will be automatically transmitted if smart mode is enabled. The Acknowledge Action bit in the Control B register (CTRLB.ACKACT) determines whether ACK or NACK should be sent.

#### **Transmitting Data Packets**

When an address packet with direction Master Write (see [Figure 27-2](#)) was transmitted successfully , INTFLAG.MB will be set. The I<sup>2</sup>C master will start transmitting data via the I<sup>2</sup>C bus by writing to DATA.DATA, and monitor continuously for packet collisions. I

If a collision is detected, the I<sup>2</sup>C master will lose arbitration and STATUS.ARBLOST will be set. If the transmit was successful, the I<sup>2</sup>C master will receive an ACK bit from the I<sup>2</sup>C slave, and STATUS.RXNACK will be cleared. INTFLAG.MB will be set in both cases, regardless of arbitration outcome.

It is recommended to read STATUS.ARBLOST and handle the arbitration lost condition in the beginning of the I<sup>2</sup>C Master on Bus interrupt. This can be done as there is no difference between handling address and data packet arbitration.

STATUS.RXNACK must be checked for each data packet transmitted before the next data packet transmission can commence. The I<sup>2</sup>C master is not allowed to continue transmitting data packets if a NACK is received from the I<sup>2</sup>C slave.

#### **Receiving Data Packets (SCLSM=0)**

When INTFLAG.SB is set, the I<sup>2</sup>C master will already have received one data packet. The I<sup>2</sup>C master must respond by sending either an ACK or NACK. Sending a NACK may be unsuccessful when arbitration is lost during the transmission. In this case, a lost arbitration will prevent setting INTFLAG.SB. Instead, INTFLAG.MB will indicate a change in arbitration. Handling of lost arbitration is the same as for data bit transmission.

### Receiving Data Packets (SCLSM=1)

When INTFLAG.SB is set, the I<sup>2</sup>C master will already have received one data packet and transmitted an ACK or NACK, depending on CTRLB.ACKACT. At this point, CTRLB.ACKACT must be set to the correct value for the next ACK bit, and the transaction can continue by reading DATA and issuing a command if not in the smart mode.

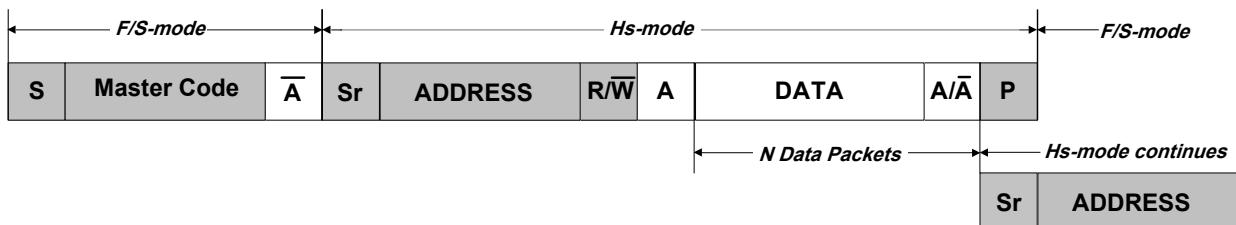

### High-Speed Mode

High-speed transfers are a multi-step process, see [High Speed Transfer](#).

First, a master code (0b00001nnn, where 'nnn' is a unique master code) is transmitted in Full-speed mode, followed by a NACK since no slaves should acknowledge. Arbitration is performed only during the Full-speed Master Code phase. The master code is transmitted by writing the master code to the address register (ADDR.ADDR) and writing the high-speed bit (ADDR.HS) to '0'.

After the master code and NACK have been transmitted, the master write interrupt will be asserted. In the meanwhile, the slave address can be written to the ADDR.ADDR register together with ADDR.HS=1. Now in High-speed mode, the master will generate a repeated start, followed by the slave address with RW-direction. The bus will remain in High-speed mode until a stop is generated. If a repeated start is desired, the ADDR.HS bit must again be written to '1', along with the new address ADDR.ADDR to be transmitted.

**Figure 27-7. High Speed Transfer**

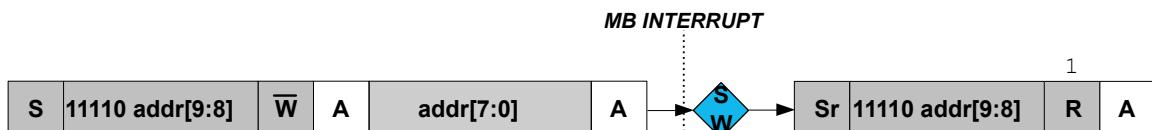

Transmitting in High-speed mode requires the I<sup>2</sup>C master to be configured in High-speed mode (CTRLA.SPEED=0x2) and the SCL clock stretch mode (CTRLA.SCLSM) bit set to '1'.

### 10-Bit Addressing

When 10-bit addressing is enabled by the Ten Bit Addressing Enable bit in the Address register (ADDR.TENBITEN=1) and the Address bit field ADDR.ADDR is written, the two address bytes will be transmitted, see [10-bit Address Transmission for a Read Transaction](#). The addressed slave acknowledges the two address bytes, and the transaction continues. Regardless of whether the transaction is a read or write, the master must start by sending the 10-bit address with the direction bit (ADDR.ADDR[0]) being zero.

If the master receives a NACK after the first byte, the write interrupt flag will be raised and the STATUS.RXNACK bit will be set. If the first byte is acknowledged by one or more slaves, then the master will proceed to transmit the second address byte and the master will first see the write interrupt flag after the second byte is transmitted. If the transaction direction is read-from-slave, the 10-bit address transmission must be followed by a repeated start and the first 7 bits of the address with the read/write bit equal to '1'.

**Figure 27-8. 10-bit Address Transmission for a Read Transaction**

This implies the following procedure for a 10-bit read operation:

1. Write the 10-bit address to ADDR.ADDR[10:1]. ADDR.TENBITEN must be '1', the direction bit (ADDR.ADDR[0]) must be '0' (can be written simultaneously with ADDR).

2. Once the Master on Bus interrupt is asserted, Write ADDR[7:0] register to '11110 address [9:8] 1'. ADDR.TENBITEN must be cleared (can be written simultaneously with ADDR).
3. Proceed to transmit data.

#### 27.6.2.5. I<sup>2</sup>C Slave Operation

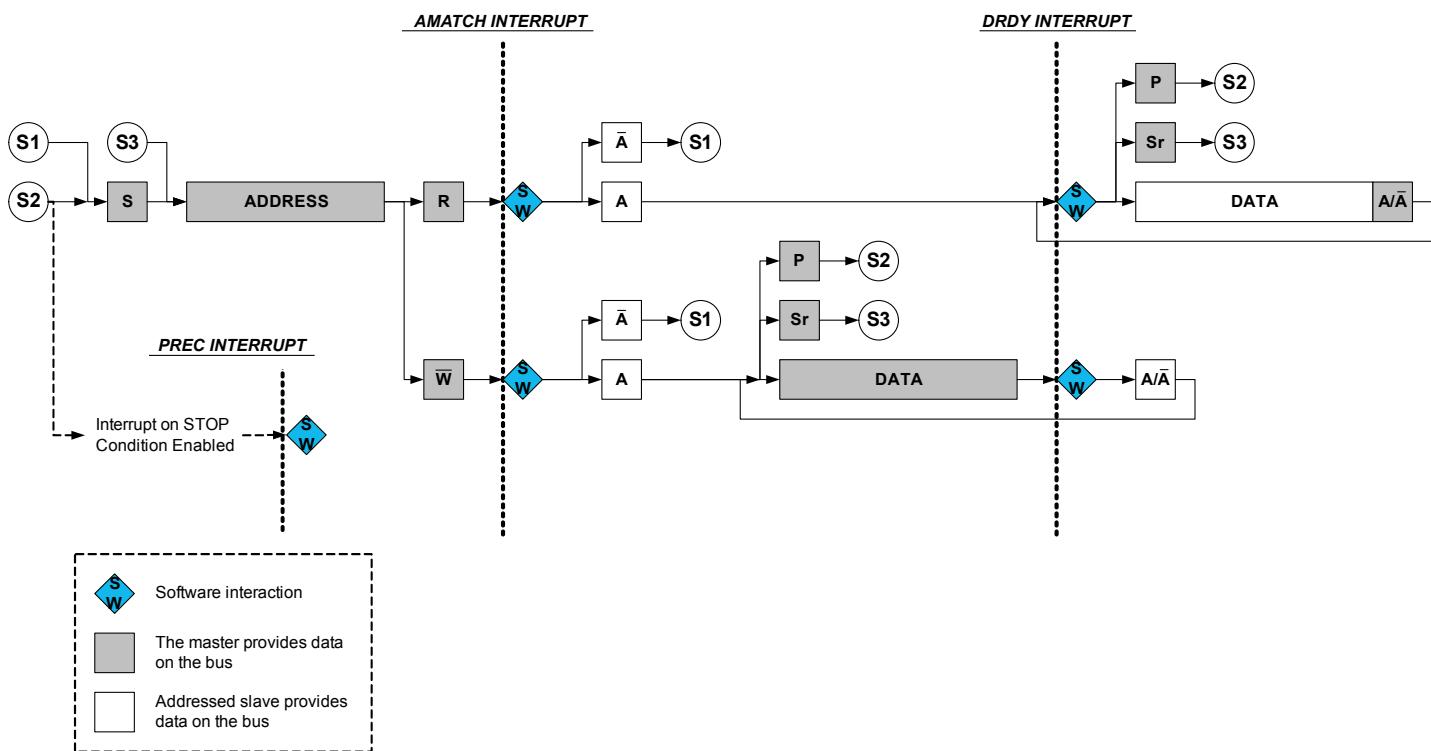

The I<sup>2</sup>C slave is byte-oriented and interrupt-based. The number of interrupts generated is kept at a minimum by automatic handling of most events. The software driver complexity and code size are reduced by auto-triggering of operations, and a special smart mode, which can be enabled by the Smart Mode Enable bit in the Control A register (CTRLA.SMEN).

The I<sup>2</sup>C slave has two interrupt strategies.

When SCL Stretch Mode bit (CTRLA.SCLSM) is '0', SCL is stretched before or after the acknowledge bit. In this mode, the I<sup>2</sup>C slave operates according to [I<sup>2</sup>C Slave Behavioral Diagram \(SCLSM=0\)](#). The circles labelled "Sn" (S1, S2..) indicate the nodes the bus logic can jump to, based on software or hardware interaction.

This diagram is used as reference for the description of the I<sup>2</sup>C slave operation throughout the document.

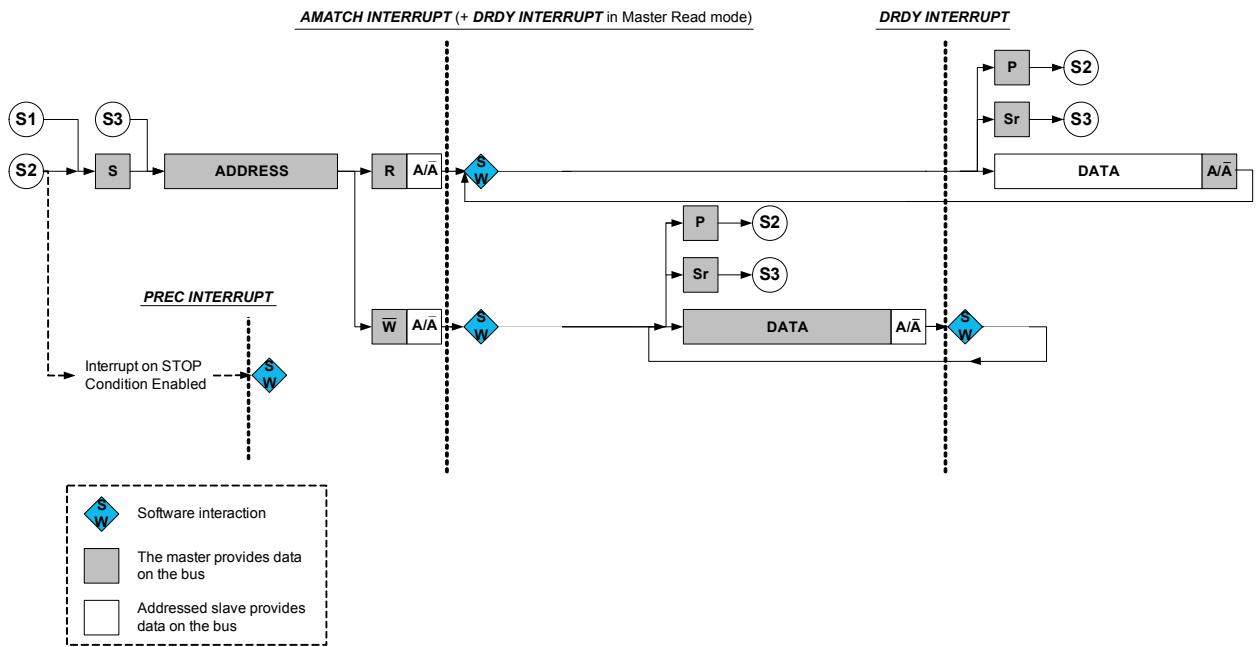

**Figure 27-9. I<sup>2</sup>C Slave Behavioral Diagram (SCLSM=0)**

In the second strategy (CTRLA.SCLSM=1), interrupts only occur after the ACK bit is sent as shown in [Slave Behavioral Diagram \(SCLSM=1\)](#). This strategy can be used when it is not necessary to check DATA before acknowledging. For master reads, an address and data interrupt will be issued simultaneously after the address acknowledge. However, for master writes, the first data interrupt will be seen after the first data byte has been received by the slave and the acknowledge bit has been sent to the master.

**Note:** For I<sup>2</sup>C High-speed mode (*Hs*), SCLSM=1 is required.

Figure 27-10. I<sup>2</sup>C Slave Behavioral Diagram (SCLSM=1)

#### Receiving Address Packets (SCLSM=0)

When CTRLA.SCLSM=0, the I<sup>2</sup>C slave stretches the SCL line according to Figure 27-9. When the I<sup>2</sup>C slave is properly configured, it will wait for a start condition.

When a start condition is detected, the successive address packet will be received and checked by the address match logic. If the received address is not a match, the packet will be rejected, and the I<sup>2</sup>C slave will wait for a new start condition. If the received address is a match, the Address Match bit in the Interrupt Flag register (INTFLAG.AMATCH) will be set.

SCL will be stretched until the I<sup>2</sup>C slave clears INTFLAG.AMATCH. As the I<sup>2</sup>C slave holds the clock by forcing SCL low, the software has unlimited time to respond.

The direction of a transaction is determined by reading the Read / Write Direction bit in the Status register (STATUS.DIR). This bit will be updated only when a valid address packet is received.

If the Transmit Collision bit in the Status register (STATUS.COLL) is set, this indicates that the last packet addressed to the I<sup>2</sup>C slave had a packet collision. A collision causes the SDA and SCL lines to be released without any notification to software. Therefore, the next AMATCH interrupt is the first indication of the previous packet's collision. Collisions are intended to follow the SMBus Address Resolution Protocol (ARP).

After the address packet has been received from the I<sup>2</sup>C master, one of two cases will arise based on transfer direction.

#### Case 1: Address packet accepted – Read flag set

The STATUS.DIR bit is '1', indicating an I<sup>2</sup>C master read operation. The SCL line is forced low, stretching the bus clock. If an ACK is sent, I<sup>2</sup>C slave hardware will set the Data Ready bit in the Interrupt Flag register (INTFLAG.DRDY), indicating data are needed for transmit. If a NACK is sent, the I<sup>2</sup>C slave will wait for a new start condition and address match.

Typically, software will immediately acknowledge the address packet by sending an ACK/NACK bit. The I<sup>2</sup>C slave Command bit field in the Control B register (CTRLB.CMD) can be written to '0x3' for both read

and write operations as the command execution is dependent on the STATUS.DIR bit. Writing '1' to INTFLAG.AMATCH will also cause an ACK/NACK to be sent corresponding to the CTRLB.ACKACT bit.

### Case 2: Address packet accepted – Write flag set

The STATUS.DIR bit is cleared, indicating an I<sup>2</sup>C master write operation. The SCL line is forced low, stretching the bus clock. If an ACK is sent, the I<sup>2</sup>C slave will wait for data to be received. Data, repeated start or stop can be received.

If a NACK is sent, the I<sup>2</sup>C slave will wait for a new start condition and address match. Typically, software will immediately acknowledge the address packet by sending an ACK/NACK. The I<sup>2</sup>C slave command CTRLB.CMD = 3 can be used for both read and write operation as the command execution is dependent on STATUS.DIR.

Writing '1' to INTFLAG.AMATCH will also cause an ACK/NACK to be sent corresponding to the CTRLB.ACKACT bit.

#### Receiving Address Packets (SCLSM=1)

When SCLSM=1, the I<sup>2</sup>C slave will stretch the SCL line only after an ACK, see [Slave Behavioral Diagram \(SCLSM=1\)](#). When the I<sup>2</sup>C slave is properly configured, it will wait for a start condition to be detected.

When a start condition is detected, the successive address packet will be received and checked by the address match logic.

If the received address is not a match, the packet will be rejected and the I<sup>2</sup>C slave will wait for a new start condition.

If the address matches, the acknowledge action as configured by the Acknowledge Action bit Control B register (CTRLB.ACKACT) will be sent and the Address Match bit in the Interrupt Flag register (INTFLAG.AMATCH) is set. SCL will be stretched until the I<sup>2</sup>C slave clears INTFLAG.AMATCH. As the I<sup>2</sup>C slave holds the clock by forcing SCL low, the software is given unlimited time to respond to the address.

The direction of a transaction is determined by reading the Read/Write Direction bit in the Status register (STATUS.DIR). This bit will be updated only when a valid address packet is received.

If the Transmit Collision bit in the Status register (STATUS.COLL) is set, the last packet addressed to the I<sup>2</sup>C slave had a packet collision. A collision causes the SDA and SCL lines to be released without any notification to software. The next AMATCH interrupt is, therefore, the first indication of the previous packet's collision. Collisions are intended to follow the SMBus Address Resolution Protocol (ARP).

After the address packet has been received from the I<sup>2</sup>C master, INTFLAG.AMATCH be set to '1' to clear it.

#### Receiving and Transmitting Data Packets

After the I<sup>2</sup>C slave has received an address packet, it will respond according to the direction either by waiting for the data packet to be received or by starting to send a data packet by writing to DATA.DATA. When a data packet is received or sent, INTFLAG.DRDY will be set. After receiving data, the I<sup>2</sup>C slave will send an acknowledge according to CTRLB.ACKACT.

### Case 1: Data received

INTFLAG.DRDY is set, and SCL is held low, pending for SW interaction.

### Case 2: Data sent

When a byte transmission is successfully completed, the INTFLAG.DRDY interrupt flag is set. If NACK is received, indicated by STATUS.RXNACK=1, the I<sup>2</sup>C slave must expect a stop or a repeated start to be received. The I<sup>2</sup>C slave must release the data line to allow the I<sup>2</sup>C master to generate a stop or repeated

start. Upon detecting a stop condition, the Stop Received bit in the Interrupt Flag register (INTFLAG.PREC) will be set and the I<sup>2</sup>C slave will return to IDLE state.

#### High-Speed Mode

When the I<sup>2</sup>C slave is configured in High-speed mode (*Hs*, CTRLA.SPEED=0x2) and CTRLA.SCLSM=1, switching between Full-speed and High-speed modes is automatic. When the slave recognizes a START followed by a master code transmission and a NACK, it automatically switches to High-speed mode and sets the High-speed status bit (STATUS.HS). The slave will then remain in High-speed mode until a STOP is received.

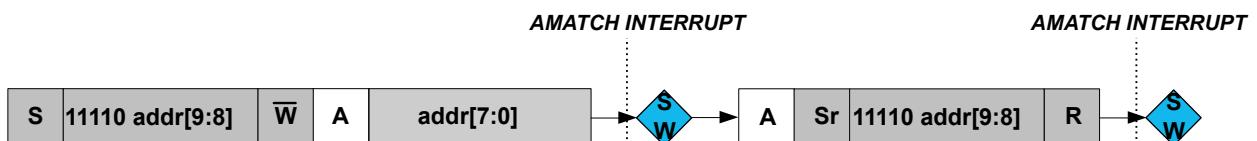

#### 10-Bit Addressing

When 10-bit addressing is enabled (ADDR.TENBITEN=1), the two address bytes following a START will be checked against the 10-bit slave address recognition. The first byte of the address will always be acknowledged, and the second byte will raise the address interrupt flag, see [10-bit Addressing](#).

If the transaction is a write, then the 10-bit address will be followed by *N* data bytes.

If the operation is a read, the 10-bit address will be followed by a repeated START and reception of '11110 ADDR[9:8] 1', and the second address interrupt will be received with the DIR bit set. The slave matches on the second address as it was addressed by the previous 10-bit address.

**Figure 27-11. 10-bit Addressing**

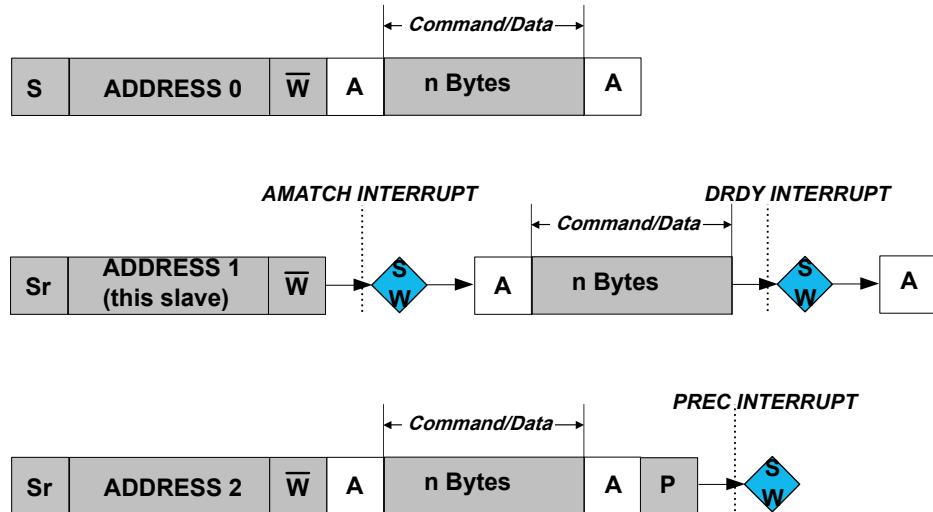

#### PMBus Group Command

When the PMBus Group Command bit in the CTRLB register is set (CTRLB.GCMD=1) and 7-bit addressing is used, INTFLAG.PREC will be set when a STOP condition is detected on the bus. When CTRLB.GCMD=0, a STOP condition without address match will not be set INTFLAG.PREC.

The group command protocol is used to send commands to more than one device. The commands are sent in one continuous transmission with a single STOP condition at the end. When the STOP condition is detected by the slaves addressed during the group command, they all begin executing the command they received.

[PMBus Group Command Example](#) shows an example where this slave, bearing ADDRESS 1, is addressed after a repeated START condition. There can be multiple slaves addressed before and after this slave. Eventually, at the end of the group command, a single STOP is generated by the master. At this point a STOP interrupt is asserted.

Figure 27-12. PMBus Group Command Example

### 27.6.3. Additional Features

#### 27.6.3.1. SMBus

The I<sup>2</sup>C includes three hardware SCL low time-outs which allow a time-out to occur for SMBus SCL low time-out, master extend time-out, and slave extend time-out. This allows for SMBus functionality. These time-outs are driven by the GCLK\_SERCOM\_SLOW clock. The GCLK\_SERCOM\_SLOW clock is used to accurately time the time-out and must be configured to use a 32KHz oscillator. The I<sup>2</sup>C interface also allows for a SMBus compatible SDA hold time.

- $T_{TIMEOUT}$ : SCL low time of 25..35ms – Measured for a single SCL low period. It is enabled by CTRL.A.LOWTOUTEN.
- $T_{LOW:SEXT}$ : Cumulative clock low extend time of 25 ms – Measured as the cumulative SCL low extend time by a slave device in a single message from the initial START to the STOP. It is enabled by CTRL.A.SEXTTOEN.
- $T_{LOW:MEXT}$ : Cumulative clock low extend time of 10 ms – Measured as the cumulative SCL low extend time by the master device within a single byte from START-to-ACK, ACK-to-ACK, or ACK-to-STOP. It is enabled by CTRL.A.MEXTTOEN.

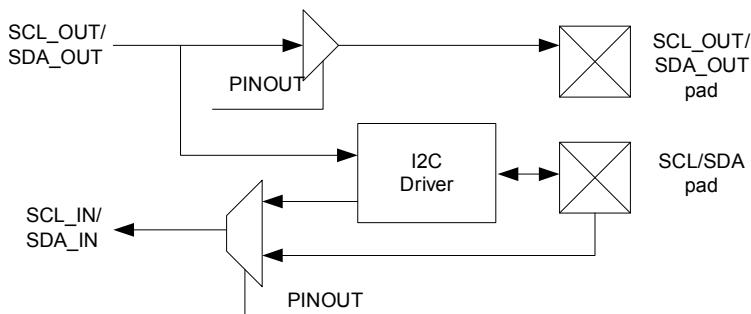

#### 27.6.3.2. Smart Mode

The I<sup>2</sup>C interface has a smart mode that simplifies application code and minimizes the user interaction needed to adhere to the I<sup>2</sup>C protocol. The smart mode accomplishes this by automatically issuing an ACK or NACK (based on the content of CTRL.B.ACCKACT) as soon as DATA.DATA is read.

#### 27.6.3.3. 4-Wire Mode

Writing a '1' to the Pin Usage bit in the Control A register (CTRL.A.PINOUT) will enable 4-wire mode operation. In this mode, the internal I<sup>2</sup>C tri-state drivers are bypassed, and an external I<sup>2</sup>C compliant tri-state driver is needed when connecting to an I<sup>2</sup>C bus.

**Figure 27-13. I<sup>2</sup>C Pad Interface**

#### 27.6.3.4. Quick Command

Setting the Quick Command Enable bit in the Control B register (CTRLB.QCEN) enables quick command. When quick command is enabled, the corresponding interrupt flag (INTFLAG.SB or INTFLAG.MB) is set immediately after the slave acknowledges the address. At this point, the software can either issue a stop command or a repeated start by writing CTRLB.CMD or ADDR.ADDR.

#### 27.6.4. Interrupts

The I<sup>2</sup>C slave has the following interrupt sources. These are asynchronous interrupts. They can wake-up the device from any sleep mode:

- Error (ERROR)
- Data Ready (DRDY)
- Address Match (AMATCH)
- Stop Received (PREC)

The I<sup>2</sup>C master has the following interrupt sources. These are asynchronous interrupts. They can wake-up the device from any sleep mode:

- Error (ERROR)
- Slave on Bus (SB)
- Master on Bus (MB)

Each interrupt source has its own interrupt flag. The interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG) will be set when the interrupt condition is met. Each interrupt can be individually enabled by writing ‘1’ to the corresponding bit in the Interrupt Enable Set register (INTENSET), and disabled by writing ‘1’ to the corresponding bit in the Interrupt Enable Clear register (INTENCLR). An interrupt request is generated when the interrupt flag is set and the corresponding interrupt is enabled. The interrupt request active until the interrupt flag is cleared, the interrupt is disabled or the I<sup>2</sup>C is reset. Refer to *INTFLAG* register for details on how to clear interrupt flags.

The I<sup>2</sup>C has one common interrupt request line for all the interrupt sources. The value of INTFLAG indicates which interrupt is executed. Note that interrupts must be globally enabled for interrupt requests. Refer to *Nested Vector Interrupt Controller* for details.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

[INTFLAG](#) on page 473

#### 27.6.5. Sleep Mode Operation

##### I<sup>2</sup>C Master Operation

The generic clock (GCLK\_SERCOMx\_CORE) will continue to run in idle sleep mode. If the Run In Standby bit in the Control A register (CTRLA.RUNSTDBY) is '1', the GLK\_SERCOMx\_CORE will also run in standby sleep mode. Any interrupt can wake up the device.

If CTRLA.RUNSTDBY=0, the GLK\_SERCOMx\_CORE will be disabled after any ongoing transaction is finished. Any interrupt can wake up the device.

## I<sup>2</sup>C Slave Operation

Writing CTRLA.RUNSTDBY=1 will allow the Address Match interrupt to wake up the device.

When CTRLA.RUNSTDBY=0, all receptions will be dropped.

### 27.6.6. Synchronization

Due to asynchronicity between the main clock domain and the peripheral clock domains, some registers need to be synchronized when written or read.

The following bits are synchronized when written:

- Software Reset bit in the CTRLA register (CTRLA.SWRST)
- Enable bit in the CTRLA register (CTRLA.ENABLE)
- Write to Bus State bits in the Status register (STATUS.BUSSTATE)
- Address bits in the Address register (ADDR.ADDR) when in master operation.

The following registers are synchronized when written:

- Data (DATA) when in master operation

Required write-synchronization is denoted by the "Write-Synchronized" property in the register description.

## 27.8. Register Description - I<sup>2</sup>C Slave

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16- and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers are optionally write-protected by the Peripheral Access Controller (PAC). Optional PAC write-protection is denoted by the "PAC Write-Protection" property in each individual register description. For details, refer to [Register Access Protection](#).

Some registers are synchronized when read and/or written. Synchronization is denoted by the "Write-Synchronized" or the "Read-Synchronized" property in each individual register description. For details, refer to [Synchronization](#).

Some registers are enable-protected, meaning they can only be written when the peripheral is disabled. Enable-protection is denoted by the "Enable-Protected" property in each individual register description.

### 27.8.1. Control A

**Name:** CTRLA  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** PAC Write-Protection, Enable-Protected, Write-Synchronized

#### Bit 30 – LOWTOUT: SCL Low Time-Out

This bit enables the SCL low time-out. If SCL is held low for 25ms-35ms, the slave will release its clock hold, if enabled, and reset the internal state machine. Any interrupt flags set at the time of time-out will remain set.

Value	Description
0	Time-out disabled.
1	Time-out enabled.

#### Bits 21:20 – SDAHIGH[1:0]: SDA Hold Time

These bits define the SDA hold time with respect to the negative edge of SCL.

These bits are not synchronized.

Value	Name	Description
0x0	DIS	Disabled
0x1	75	50-100ns hold time
0x2	450	300-600ns hold time
0x3	600	400-800ns hold time

### **Bit 16 – PINOUT: Pin Usage**

This bit sets the pin usage to either two- or four-wire operation:

This bit is not synchronized.

Value	Description
0	4-wire operation disabled
1	4-wire operation enabled

### **Bit 7 – RUNSTDBY: Run in Standby**

This bit defines the functionality in standby sleep mode.

This bit is not synchronized.

Value	Description
0	Disabled – All reception is dropped.
1	Wake on address match, if enabled.

### **Bits 4:2 – MODE[2:0]: Operating Mode**

These bits must be written to 0x04 to select the I<sup>2</sup>C slave serial communication interface of the SERCOM.

These bits are not synchronized.

### **Bit 1 – ENABLE: Enable**

Due to synchronization, there is delay from writing CTRLA.ENABLE until the peripheral is enabled/disabled. The value written to CTRLA.ENABLE will read back immediately and the Enable Synchronization Busy bit in the Synchronization Busy register (SYNCBUSY.ENABLE) will be set. SYNCBUSY.ENABLE will be cleared when the operation is complete.

This bit is not enable-protected.

Value	Description
0	The peripheral is disabled or being disabled.
1	The peripheral is enabled.

### **Bit 0 – SWRST: Software Reset**

Writing '0' to this bit has no effect.

Writing '1' to this bit resets all registers in the SERCOM, except DBGCTRL, to their initial state, and the SERCOM will be disabled.

Writing '1' to CTRLA.SWRST will always take precedence, meaning that all other writes in the same write-operation will be discarded. Any register write access during the ongoing reset will result in an APB error. Reading any register will return the reset value of the register.

Due to synchronization, there is a delay from writing CTRLA.SWRST until the reset is complete. CTRLA.SWRST and SYNCBUSY.SWRST will both be cleared when the reset is complete.

This bit is not enable-protected.

Value	Description
0	There is no reset operation ongoing.
1	The reset operation is ongoing.

## 27.8.2. Control B

**Name:** CTRLB

**Offset:** 0x04

**Reset:** 0x00000000

**Property:** PAC Write-Protection, Enable-Protected, Write-Synchronized

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access						ACKACT	CMD[1:0]	
Reset						0	0	0
Bit	15	14	13	12	11	10	9	8
Access	R/W	R/W						R/W
Reset	0	0						0
Bit	7	6	5	4	3	2	1	0
Access								
Reset								

### Bit 18 – ACKACT: Acknowledge Action

This bit defines the slave's acknowledge behavior after an address or data byte is received from the master. The acknowledge action is executed when a command is written to the CMD bits. If smart mode is enabled (CTRLB.SMEN=1), the acknowledge action is performed when the DATA register is read.

This bit is not enable-protected.

Value	Description
0	Send ACK
1	Send NACK

### Bits 17:16 – CMD[1:0]: Command

This bit field triggers the slave operation as the below. The CMD bits are strobe bits, and always read as zero. The operation is dependent on the slave interrupt flags, INTFLAG.DRDY and INTFLAG.AMATCH, in addition to STATUS.DIR.

All interrupt flags (INTFLAG.DRDY, INTFLAG.AMATCH and INTFLAG.PREC) are automatically cleared when a command is given.

This bit is not enable-protected.

**Table 27-1. Command Description**

CMD[1:0]	DIR	Action
0x0	X	(No action)
0x1	X	(Reserved)
0x2	Used to complete a transaction in response to a data interrupt (DRDY)	
	0 (Master write)	Execute acknowledge action succeeded by waiting for any start (S/Sr) condition
	1 (Master read)	Wait for any start (S/Sr) condition
0x3	Used in response to an address interrupt (AMATCH)	
	0 (Master write)	Execute acknowledge action succeeded by reception of next byte
	1 (Master read)	Execute acknowledge action succeeded by slave data interrupt
	Used in response to a data interrupt (DRDY)	
	0 (Master write)	Execute acknowledge action succeeded by reception of next byte
	1 (Master read)	Execute a byte read operation followed by ACK/NACK reception

#### **Bits 15:14 – AMODE[1:0]: Address Mode**

These bits set the addressing mode.

These bits are not write-synchronized.

Value	Name	Description
0x0	MASK	The slave responds to the address written in ADDR.ADDR masked by the value in ADDR.ADDRMASK. See <i>SERCOM – Serial Communication Interface</i> for additional information.
0x1	2_ADDRS	The slave responds to the two unique addresses in ADDR.ADDR and ADDR.ADDRMASK.
0x2	RANGE	The slave responds to the range of addresses between and including ADDR.ADDR and ADDR.ADDRMASK. ADDR.ADDR is the upper limit.
0x3	-	Reserved.

#### **Bit 8 – SMEN: Smart Mode Enable**

When smart mode is enabled, data is acknowledged automatically when DATA.DATA is read.

This bit is not write-synchronized.

Value	Description
0	Smart mode is disabled.
1	Smart mode is enabled.

### 27.8.3. Interrupt Enable Clear

This register allows the user to disable an interrupt without doing a read-modify-write operation. Changes in this register will also be reflected in the Interrupt Enable Set register (INTENSET).

**Name:** INTENCLR

**Offset:** 0x0C

**Reset:** 0x00

**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access						DRDY	AMATCH	PREC
Reset						R/W	R/W	R/W

#### Bit 2 – DRDY: Data Ready Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Data Ready bit, which disables the Data Ready interrupt.

Value	Description
0	The Data Ready interrupt is disabled.
1	The Data Ready interrupt is enabled.

#### Bit 1 – AMATCH: Address Match Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Address Match Interrupt Enable bit, which disables the Address Match interrupt.

Value	Description
0	The Address Match interrupt is disabled.
1	The Address Match interrupt is enabled.

#### Bit 0 – PREC: Stop Received Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Stop Received Interrupt Enable bit, which disables the Stop Received interrupt.

Value	Description
0	The Stop Received interrupt is disabled.
1	The Stop Received interrupt is enabled.

#### 27.8.4. Interrupt Enable Set

This register allows the user to enable an interrupt without doing a read-modify-write operation. Changes in this register will also be reflected in the Interrupt Enable Clear register (INTENCLR).

**Name:** INTENSET

**Offset:** 0x0D

**Reset:** 0x00

**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access						DRDY	AMATCH	PREC
Reset						R/W	R/W	R/W

##### Bit 2 – DRDY: Data Ready Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will set the Data Ready bit, which enables the Data Ready interrupt.

Value	Description
0	The Data Ready interrupt is disabled.
1	The Data Ready interrupt is enabled.

##### Bit 1 – AMATCH: Address Match Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will set the Address Match Interrupt Enable bit, which enables the Address Match interrupt.

Value	Description
0	The Address Match interrupt is disabled.
1	The Address Match interrupt is enabled.

##### Bit 0 – PREC: Stop Received Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will set the Stop Received Interrupt Enable bit, which enables the Stop Received interrupt.

Value	Description
0	The Stop Received interrupt is disabled.
1	The Stop Received interrupt is enabled.

## 27.8.5. Interrupt Flag Status and Clear

**Name:** INTFLAG

**Offset:** 0x0E

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0
Access						DRDY	AMATCH	PREC
Reset						R/W	R/W	R/W

### Bit 2 – DRDY: Data Ready

This flag is set when a I<sup>2</sup>C slave byte transmission is successfully completed.

The flag is cleared by hardware when either:

- Writing to the DATA register.
- Reading the DATA register with smart mode enabled.
- Writing a valid command to the CMD register.

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Data Ready interrupt flag.

### Bit 1 – AMATCH: Address Match

This flag is set when the I<sup>2</sup>C slave address match logic detects that a valid address has been received.

The flag is cleared by hardware when CTRL.CMD is written.

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Address Match interrupt flag. When cleared, an ACK/NACK will be sent according to CTRLB.ACKACT.

### Bit 0 – PREC: Stop Received

This flag is set when a stop condition is detected for a transaction being processed. A stop condition detected between a bus master and another slave will not set this flag, unless the PMBus Group Command is enabled in the Control B register (CTRLB.GCMD=1).

This flag is cleared by hardware after a command is issued on the next address match.

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Stop Received interrupt flag.

## 27.8.6. Status

**Name:** STATUS

**Offset:** 0x10

**Reset:** 0x0000

**Property:** -

Bit	15	14	13	12	11	10	9	8
	SYNCBUSY							
Access	R/W							
Reset	0							
Bit	7	6	5	4	3	2	1	0
	CLKHOLD	LOWTOUT		SR	DIR	RXNACK	COLL	BUSERR
Access	R	R/W		R	R	R	R/W	R/W
Reset	0	0		0	0	0	0	0

### Bit 15 – SYNCBUSY: Synchronization Busy

This bit is set when the synchronization of registers between clock domains is started.

This bit is cleared when the synchronization of registers between the clock domains is complete.

### Bit 7 – CLKHOLD: Clock Hold

The slave Clock Hold bit (STATUS.CLKHOLD) is set when the slave is holding the SCL line low, stretching the I2C clock. Software should consider this bit a read-only status flag that is set when INTFLAG.DRDY or INTFLAG.AMATCH is set.

This bit is automatically cleared when the corresponding interrupt is also cleared.

### Bit 6 – LOWTOUT: SCL Low Time-out

This bit is set if an SCL low time-out occurs.

This bit is cleared automatically if responding to a new start condition with ACK or NACK (write 3 to CTRLB.CMD) or when INTFLAG.AMATCH is cleared.

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will clear the status.

Value	Description
0	No SCL low time-out has occurred.
1	SCL low time-out has occurred.

### Bit 4 – SR: Repeated Start

When INTFLAG.AMATCH is raised due to an address match, SR indicates a repeated start or start condition.

This flag is only valid while the INTFLAG.AMATCH flag is one.

Value	Description
0	Start condition on last address match
1	Repeated start condition on last address match

### **Bit 3 – DIR: Read / Write Direction**

The Read/Write Direction (STATUS.DIR) bit stores the direction of the last address packet received from a master.

Value	Description
0	Master write operation is in progress.
1	Master read operation is in progress.

### **Bit 2 – RXNACK: Received Not Acknowledge**

This bit indicates whether the last data packet sent was acknowledged or not.

Value	Description
0	Master responded with ACK.
1	Master responded with NACK.

### **Bit 1 – COLL: Transmit Collision**

If set, the I2C slave was not able to transmit a high data or NACK bit, the I2C slave will immediately release the SDA and SCL lines and wait for the next packet addressed to it.

This flag is intended for the SMBus address resolution protocol (ARP). A detected collision in non-ARP situations indicates that there has been a protocol violation, and should be treated as a bus error.

Note that this status will not trigger any interrupt, and should be checked by software to verify that the data were sent correctly. This bit is cleared automatically if responding to an address match with an ACK or a NACK (writing 0x3 to CTRLB.CMD), or INTFLAG.AMATCH is cleared.

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will clear the status.

Value	Description
0	No collision detected on last data byte sent.
1	Collision detected on last data byte sent.

### **Bit 0 – BUSERR: Bus Error**

The Bus Error bit (STATUS.BUSERR) indicates that an illegal bus condition has occurred on the bus, regardless of bus ownership. An illegal bus condition is detected if a protocol violating start, repeated start or stop is detected on the I2C bus lines. A start condition directly followed by a stop condition is one example of a protocol violation. If a time-out occurs during a frame, this is also considered a protocol violation, and will set STATUS.BUSERR.

This bit is cleared automatically if responding to an address match with an ACK or a NACK (writing 0x3 to CTRLB.CMD) or INTFLAG.AMATCH is cleared.

Writing a '1' to this bit will clear the status.

Writing a '0' to this bit has no effect.

Value	Description
0	No bus error detected.
1	Bus error detected.

### 27.8.7. Address

**Name:** ADDR  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** PAC Write-Protection, Enable-Protected

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
ADDRMASK[6:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
ADDR[6:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 23:17 – ADDRMASK[6:0]: Address Mask

These bits act as a second address match register, an address mask register or the lower limit of an address range, depending on the CTRLB.AMODE setting.

#### Bits 7:1 – ADDR[6:0]: Address

These bits contain the I<sup>2</sup>C slave address used by the slave address match logic to determine if a master has addressed the slave.

When using 7-bit addressing, the slave address is represented by ADDR[6:0].

When using 10-bit addressing (ADDR.TENBITEN=1), the slave address is represented by ADDR[9:0].

When the address match logic detects a match, INTFLAG.AMATCH is set and STATUS.DIR is updated to indicate whether it is a read or a write transaction.

#### Bit 0 – GENCEN: General Call Address Enable

A general call address is an address consisting of all-zeroes, including the direction bit (master write).

Value	Description
0	General call address recognition disabled.
1	General call address recognition enabled.

## 27.8.8. Data

**Name:** DATA  
**Offset:** 0x18  
**Reset:** 0x0000  
**Property:** Write-Synchronized, Read-Synchronized

Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	DATA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 7:0 – DATA[7:0]: Data

The slave data register I/O location (DATA.DATA) provides access to the master transmit and receive data buffers. Reading valid data or writing data to be transmitted can be successfully done only when SCL is held low by the slave (STATUS.CLKHold is set). An exception occurs when reading the last data byte after the stop condition has been received.

Accessing DATA.DATA auto-triggers I<sup>2</sup>C bus operations. The operation performed depends on the state of CTRLB.ACKACT, CTRLB.SMEN and the type of access (read/write).

Writing or reading DATA.DATA when not in smart mode does not require synchronization.

## 27.9. Register Summary - I<sup>2</sup>C Master

Offset	Name	Bit Pos.								
0x00	CTRLA	7:0	RUNSTDBY				MODE[2:0]		ENABLE	SWRST
0x01		15:8								
0x02		23:16			SDAHOLD[1:0]					PINOUT
0x03		31:24		LOWTOUT	INACTOUT[1:0]					
0x04	CTRLB	7:0								
0x05		15:8							QCEN	SMEN
0x06		23:16						ACKACT	CMD[1:0]	
0x07		31:24								
0x08	DBGCTRL	7:0								DBGSTOP
0x09	Reserved									
0x0A	BAUD	7:0					BAUD[7:0]			
0x0B		15:8					BAUDLOW[7:0]			
0x0C	INTENCLR	7:0							SB	MB
0x0D	INTENSET	7:0							SB	MB
0x0E	INTFLAG	7:0							SB	MB
0x0F	Reserved									
0x10	STATUS	7:0	CLKHOLD	LOWTOUT	BUSSTATE[1:0]			RXNACK	ARBLOST	BUSERR
0x11		15:8						SYNCBUSY		
0x12	...									
0x13										
0x14	ADDR	7:0					ADDR[6:0]			
0x15		15:8								
0x16	...									
0x17										
0x18	DATA	7:0					DATA[7:0]			
0x19		15:8								

## 27.10. Register Description - I<sup>2</sup>C Master

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16- and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers are optionally write-protected by the Peripheral Access Controller (PAC). Optional PAC write-protection is denoted by the "PAC Write-Protection" property in each individual register description. For details, refer to [Register Access Protection](#).

Some registers are synchronized when read and/or written. Synchronization is denoted by the "Write-Synchronized" or the "Read-Synchronized" property in each individual register description. For details, refer to [Synchronization](#).

Some registers are enable-protected, meaning they can only be written when the peripheral is disabled. Enable-protection is denoted by the "Enable-Protected" property in each individual register description.

### 27.10.1. Control A

**Name:** CTRLA  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** PAC Write-Protection, Enable-Protected, Write-Synchronized

Bit	31	30	29	28	27	26	25	24
		LOWTOUT		INACTOUT[1:0]				
Access		R/W	R/W	R/W				
Reset		0	0	0				
Bit	23	22	21	20	19	18	17	16
			SDAHHOLD[1:0]					PINOUT
Access			R/W	R/W				R/W
Reset			0	0				0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	RUNSTDBY			MODE[2:0]		ENABLE		SWRST
Access	R/W			R/W	R/W	R/W	R/W	R/W
Reset	0			0	0	0	0	0

#### Bit 30 – LOWTOUT: SCL Low Time-Out

This bit enables the SCL low time-out. If SCL is held low for 25ms-35ms, the master will release its clock hold, if enabled, and complete the current transaction. A stop condition will automatically be transmitted.

INTFLAG.SB or INTFLAG.MB will be set as normal, but the clock hold will be released. The STATUS.LOWTOUT and STATUS.BUSERR status bits will be set.

This bit is not synchronized.

Value	Description
0	Time-out disabled.
1	Time-out enabled.

#### Bits 29:28 – INACTOUT[1:0]: Inactive Time-Out

If the inactive bus time-out is enabled and the bus is inactive for longer than the time-out setting, the bus state logic will be set to idle. An inactive bus arise when either an I<sup>2</sup>C master or slave is holding the SCL low.

Enabling this option is necessary for SMBus compatibility, but can also be used in a non-SMBus set-up.

Calculated time-out periods are based on a 100kHz baud rate.

These bits are not synchronized.

Value	Name	Description
0x0	DIS	Disabled
0x1	55US	5-6 SCL cycle time-out (50-60µs)
0x2	105US	10-11 SCL cycle time-out (100-110µs)
0x3	205US	20-21 SCL cycle time-out (200-210µs)

#### Bits 21:20 – SDAHOLD[1:0]: SDA Hold Time

These bits define the SDA hold time with respect to the negative edge of SCL.

These bits are not synchronized.

Value	Name	Description
0x0	DIS	Disabled
0x1	75NS	50-100ns hold time
0x2	450NS	300-600ns hold time
0x3	600NS	400-800ns hold time

#### Bit 16 – PINOUT: Pin Usage

This bit set the pin usage to either two- or four-wire operation:

This bit is not synchronized.

Value	Description
0	4-wire operation disabled.
1	4-wire operation enabled.

#### Bit 7 – RUNSTDBY: Run in Standby

This bit defines the functionality in standby sleep mode.

This bit is not synchronized.

Value	Description
0	GCLK_SERCOMx_CORE is disabled and the I <sup>2</sup> C master will not operate in standby sleep mode.
1	GCLK_SERCOMx_CORE is enabled in all sleep modes.

#### Bits 4:2 – MODE[2:0]: Operating Mode

These bits must be written to 0x5 to select the I<sup>2</sup>C master serial communication interface of the SERCOM.

These bits are not synchronized.

#### Bit 1 – ENABLE: Enable

Due to synchronization, there is delay from writing CTRLA.ENABLE until the peripheral is enabled/disabled. The value written to CTRLA.ENABLE will read back immediately and the Synchronization Enable Busy bit in the Synchronization Busy register (SYNCBUSY.ENABLE) will be set. SYNCBUSY.ENABLE will be cleared when the operation is complete.

This bit is not enable-protected.

Value	Description
0	The peripheral is disabled or being disabled.
1	The peripheral is enabled.

#### Bit 0 – SWRST: Software Reset

Writing '0' to this bit has no effect.

Writing '1' to this bit resets all registers in the SERCOM, except DBGCTRL, to their initial state, and the SERCOM will be disabled.

Writing '1' to CTRLA.SWRST will always take precedence, meaning that all other writes in the same write-operation will be discarded. Any register write access during the ongoing reset will result in an APB error. Reading any register will return the reset value of the register.

Due to synchronization there is a delay from writing CTRLA.SWRST until the reset is complete. CTRLA.SWRST and SYNCBUSY.SWRST will both be cleared when the reset is complete.

This bit is not enable-protected.

Value	Description
0	There is no reset operation ongoing.
1	The reset operation is ongoing.

## 27.10.2. Control B

**Name:** CTRLB

**Offset:** 0x04

**Reset:** 0x00000000

**Property:** PAC Write-Protection, Enable-Protected, Write-Synchronized

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access								
Reset								

### Bit 18 – ACKACT: Acknowledge Action

This bit defines the I<sup>2</sup>C master's acknowledge behavior after a data byte is received from the I<sup>2</sup>C slave. The acknowledge action is executed when a command is written to CTRLB.CMD, or if smart mode is enabled (CTRLB.SMEN is written to one), when DATA.DATA is read.

This bit is not enable-protected.

This bit is not write-synchronized.

Value	Description
0	Send ACK.
1	Send NACK.

### Bits 17:16 – CMD[1:0]: Command

Writing these bits triggers a master operation as described below. The CMD bits are strobe bits, and always read as zero. The acknowledge action is only valid in master read mode. In master write mode, a command will only result in a repeated start or stop condition. The CTRLB.ACKACT bit and the CMD bits can be written at the same time, and then the acknowledge action will be updated before the command is triggered.

Commands can only be issued when either the Slave on Bus interrupt flag (INTFLAG.SB) or Master on Bus interrupt flag (INTFLAG.MB) is '1'.

If CMD 0x1 is issued, a repeated start will be issued followed by the transmission of the current address in ADDR.ADDR. If another address is desired, ADDR.ADDR must be written instead of the CMD bits. This will trigger a repeated start followed by transmission of the new address.

Issuing a command will set the System Operation bit in the Synchronization Busy register (SYNCBUSY.SYSOP).

**Table 27-2. Command Description**

CMD[1:0]	Direction	Action
0x0	X	(No action)
0x1	X	Execute acknowledge action succeeded by repeated Start
0x2	0 (Write)	No operation
	1 (Read)	Execute acknowledge action succeeded by a byte read operation
0x3	X	Execute acknowledge action succeeded by issuing a stop condition

These bits are not enable-protected.

#### **Bit 9 – QCEN: Quick Command Enable**

This bit is not write-synchronized.

Value	Description
0	Quick Command is disabled.
1	Quick Command is enabled.

#### **Bit 8 – SMEN: Smart Mode Enable**

When smart mode is enabled, acknowledge action is sent when DATA.DATA is read.

This bit is not write-synchronized.

Value	Description
0	Smart mode is disabled.
1	Smart mode is enabled.

### 27.10.3. Debug Control

**Name:** DBGCTRL  
**Offset:** 0x08  
**Reset:** 0x00  
**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0	Access	R/W
								DBGSTOP		
Reset								0		

#### Bit 0 – DBGSTOP: Debug Stop Mode

This bit controls functionality when the CPU is halted by an external debugger.

Value	Description
0	The baud-rate generator continues normal operation when the CPU is halted by an external debugger.
1	The baud-rate generator is halted when the CPU is halted by an external debugger.

#### 27.10.4. Baud Rate

**Name:** BAUD  
**Offset:** 0x0A  
**Reset:** 0x0000  
**Property:** PAC Write-Protection, Enable-Protected

Bit	15	14	13	12	11	10	9	8
BAUDLOW[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
BAUD[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 15:8 – BAUDLOW[7:0]: Master Baud Rate Low

If this bit field is non-zero, the SCL low time will be described by the value written.

For more information on how to calculate the frequency, see SERCOM [Clock Generation – Baud-Rate Generator](#).

#### Bits 7:0 – BAUD[7:0]: Master Baud Rate

This bit field is used to derive the SCL high time if BAUD.BAUDLOW is non-zero. If BAUD.BAUDLOW is zero, BAUD will be used to generate both high and low periods of the SCL.

For more information on how to calculate the frequency, see SERCOM [Clock Generation – Baud-Rate Generator](#).

### 27.10.5. Interrupt Enable Clear

This register allows the user to disable an interrupt without doing a read-modify-write operation. Changes in this register will also be reflected in the Interrupt Enable Set register (INTENSET).

**Name:** INTENCLR

**Offset:** 0x0C

**Reset:** 0x00

**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access							SB	MB
Reset							R/W	R/W

#### Bit 1 – SB: Slave on Bus Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Slave on Bus Interrupt Enable bit, which disables the Slave on Bus interrupt.

Value	Description
0	The Slave on Bus interrupt is disabled.
1	The Slave on Bus interrupt is enabled.

#### Bit 0 – MB: Master on Bus Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear the Master on Bus Interrupt Enable bit, which disables the Master on Bus interrupt.

Value	Description
0	The Master on Bus interrupt is disabled.
1	The Master on Bus interrupt is enabled.

#### 27.10.6. Interrupt Enable Clear

This register allows the user to enable an interrupt without doing a read-modify-write operation. Changes in this register will also be reflected in the Interrupt Enable Clear register (INTENCLR).

**Name:** INTENSET

**Offset:** 0x0D

**Reset:** 0x00

**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access							SB	MB
Reset							R/W	R/W

##### Bit 1 – SB: Slave on Bus Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will set the Slave on Bus Interrupt Enable bit, which enables the Slave on Bus interrupt.

Value	Description
0	The Slave on Bus interrupt is disabled.
1	The Slave on Bus interrupt is enabled.

##### Bit 0 – MB: Master on Bus Interrupt Enable

Writing '0' to this bit has no effect.

Writing '1' to this bit will set the Master on Bus Interrupt Enable bit, which enables the Master on Bus interrupt.

Value	Description
0	The Master on Bus interrupt is disabled.
1	The Master on Bus interrupt is enabled.

## 27.10.7. Interrupt Flag Status and Clear

Name: INTFLAG

Offset: 0x0E

Reset: 0x00

Property: -

Bit	7	6	5	4	3	2	1	0
Access							SB	MB
Reset							0	0
	R/W						R/W	

### Bit 1 – SB: Slave on Bus

The Slave on Bus flag (SB) is set when a byte is successfully received in master read mode, i.e., no arbitration lost or bus error occurred during the operation. When this flag is set, the master forces the SCL line low, stretching the I<sup>2</sup>C clock period. The SCL line will be released and SB will be cleared on one of the following actions:

- Writing to ADDR.ADDR
- Writing to DATA.DATA
- Reading DATA.DATA when smart mode is enabled (CTRLB.SMEN)
- Writing a valid command to CTRLB.CMD

Writing '1' to this bit location will clear the SB flag. The transaction will not continue or be terminated until one of the above actions is performed.

Writing '0' to this bit has no effect.

### Bit 0 – MB: Master on Bus

This flag is set when a byte is transmitted in master write mode. The flag is set regardless of the occurrence of a bus error or an arbitration lost condition. MB is also set when arbitration is lost during sending of NACK in master read mode, or when issuing a start condition if the bus state is unknown. When this flag is set and arbitration is not lost, the master forces the SCL line low, stretching the I<sup>2</sup>C clock period. The SCL line will be released and MB will be cleared on one of the following actions:

- Writing to ADDR.ADDR
- Writing to DATA.DATA
- Reading DATA.DATA when smart mode is enabled (CTRLB.SMEN)
- Writing a valid command to CTRLB.CMD

Writing '1' to this bit location will clear the MB flag. The transaction will not continue or be terminated until one of the above actions is performed.

Writing '0' to this bit has no effect.

## 27.10.8. Status

**Name:** STATUS  
**Offset:** 0x10  
**Reset:** 0x0000  
**Property:** Write-Synchronized

Bit	15	14	13	12	11	10	9	8
						SYNCBUSY		
Access						R/W		
Reset						0		
Bit	7	6	5	4	3	2	1	0
	CLKHOLD	LOWTOUT	BUSSTATE[1:0]			RXNACK	ARBLOST	BUSERR
Access	R	R/W	R	R		R	R/W	R/W
Reset	0	0	0	0		0	0	0

### Bit 10 – SYNCBUSY: Synchronization Busy

This bit is cleared when the synchronization of registers between the clock domains is complete.

This bit is set when the synchronization of registers between clock domains is started.

### Bit 7 – CLKHOLD: Clock Hold

This bit is set when the master is holding the SCL line low, stretching the I<sup>2</sup>C clock. Software should consider this bit when INTFLAG.SB or INTFLAG.MB is set.

This bit is cleared when the corresponding interrupt flag is cleared and the next operation is given.

Writing '0' to this bit has no effect.

Writing '1' to this bit has no effect.

This bit is not write-synchronized.

### Bit 6 – LOWTOUT: SCL Low Time-Out

This bit is set if an SCL low time-out occurs.

Writing '1' to this bit location will clear this bit. This flag is automatically cleared when writing to the ADDR register.

Writing '0' to this bit has no effect.

This bit is not write-synchronized.

### Bits 5:4 – BUSSTATE[1:0]: Bus State

These bits indicate the current I<sup>2</sup>C bus state.

When in UNKNOWN state, writing 0x1 to BUSSTATE forces the bus state into the IDLE state. The bus state cannot be forced into any other state.

Writing BUSSTATE to idle will set SYNCBUSY.SYSOP.

Value	Name	Description
0x0	UNKNOWN	The bus state is unknown to the I <sup>2</sup> C master and will wait for a stop condition to be detected or wait to be forced into an idle state by software
0x1	IDLE	The bus state is waiting for a transaction to be initialized
0x2	OWNER	The I <sup>2</sup> C master is the current owner of the bus
0x3	BUSY	Some other I <sup>2</sup> C master owns the bus

#### Bit 2 – RXNACK: Received Not Acknowledge

This bit indicates whether the last address or data packet sent was acknowledged or not.

Writing '0' to this bit has no effect.

Writing '1' to this bit has no effect.

This bit is not write-synchronized.

Value	Description
0	Slave responded with ACK.
1	Slave responded with NACK.

#### Bit 1 – ARBLOST: Arbitration Lost

This bit is set if arbitration is lost while transmitting a high data bit or a NACK bit, or while issuing a start or repeated start condition on the bus. The Master on Bus interrupt flag (INTFLAG.MB) will be set when STATUS.ARBLOST is set.

Writing the ADDR.ADDR register will automatically clear STATUS.ARBLOST.

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear it.

This bit is not write-synchronized.

#### Bit 0 – BUSERR: Bus Error

This bit indicates that an illegal bus condition has occurred on the bus, regardless of bus ownership. An illegal bus condition is detected if a protocol violating start, repeated start or stop is detected on the I<sup>2</sup>C bus lines. A start condition directly followed by a stop condition is one example of a protocol violation. If a time-out occurs during a frame, this is also considered a protocol violation, and will set BUSERR.

If the I<sup>2</sup>C master is the bus owner at the time a bus error occurs, STATUS.ARBLOST and INTFLAG.MB will be set in addition to BUSERR.

Writing the ADDR.ADDR register will automatically clear the BUSERR flag.

Writing '0' to this bit has no effect.

Writing '1' to this bit will clear it.

This bit is not write-synchronized.

## 27.10.9. Address

**Name:** ADDR  
**Offset:** 0x14  
**Reset:** 0x0000  
**Property:** Write-Synchronized

Bit	15	14	13	12	11	10	9	8				
Access												
Reset												
Bit	7	6	5	4	3	2	1	0				
Access					ADDR[6:0]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W				
	0	0	0	0	0	0	0	0				

### Bits 6:0 – ADDR[6:0]: Address

When ADDR is written, the consecutive operation will depend on the bus state:

UNKNOWN: INTFLAG.MB and STATUS.BUSERR are set, and the operation is terminated.

BUSY: The I<sup>2</sup>C master will await further operation until the bus becomes IDLE.

IDLE: The I<sup>2</sup>C master will issue a start condition followed by the address written in ADDR. If the address is acknowledged, SCL is forced and held low, and STATUS.CLKHOLD and INTFLAG.MB are set.

OWNER: A repeated start sequence will be performed. If the previous transaction was a read, the acknowledge action is sent before the repeated start bus condition is issued on the bus. Writing ADDR to issue a repeated start is performed while INTFLAG.MB or INTFLAG.SB is set.

STATUS.BUSERR, STATUS.ARBLOST, INTFLAG.MB and INTFLAG.SB will be cleared when ADDR is written.

The ADDR register can be read at any time without interfering with ongoing bus activity, as a read access does not trigger the master logic to perform any bus protocol related operations.

The I<sup>2</sup>C master control logic uses bit 0 of ADDR as the bus protocol's read/write flag (R/W); 0 for write and 1 for read.

## 27.10.10. Data

**Name:** DATA  
**Offset:** 0x18  
**Reset:** 0x0000  
**Property:** Write-Synchronized, Read-Synchronized

Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access	R/W							
Reset	0	0	0	0	0	0	0	0

### Bits 7:0 – DATA[7:0]: Data

The master data register I/O location (DATA) provides access to the master transmit and receive data buffers. Reading valid data or writing data to be transmitted can be successfully done only when SCL is held low by the master (STATUS.CLKHold is set). An exception is reading the last data byte after the stop condition has been sent.

Accessing DATA.DATA auto-triggers I<sup>2</sup>C bus operations. The operation performed depends on the state of CTRLB.ACKACT, CTRLB.SMEN and the type of access (read/write).

Writing or reading DATA.DATA when not in smart mode does not require synchronization.

## 28. TC – Timer/Counter

### 28.1. Overview

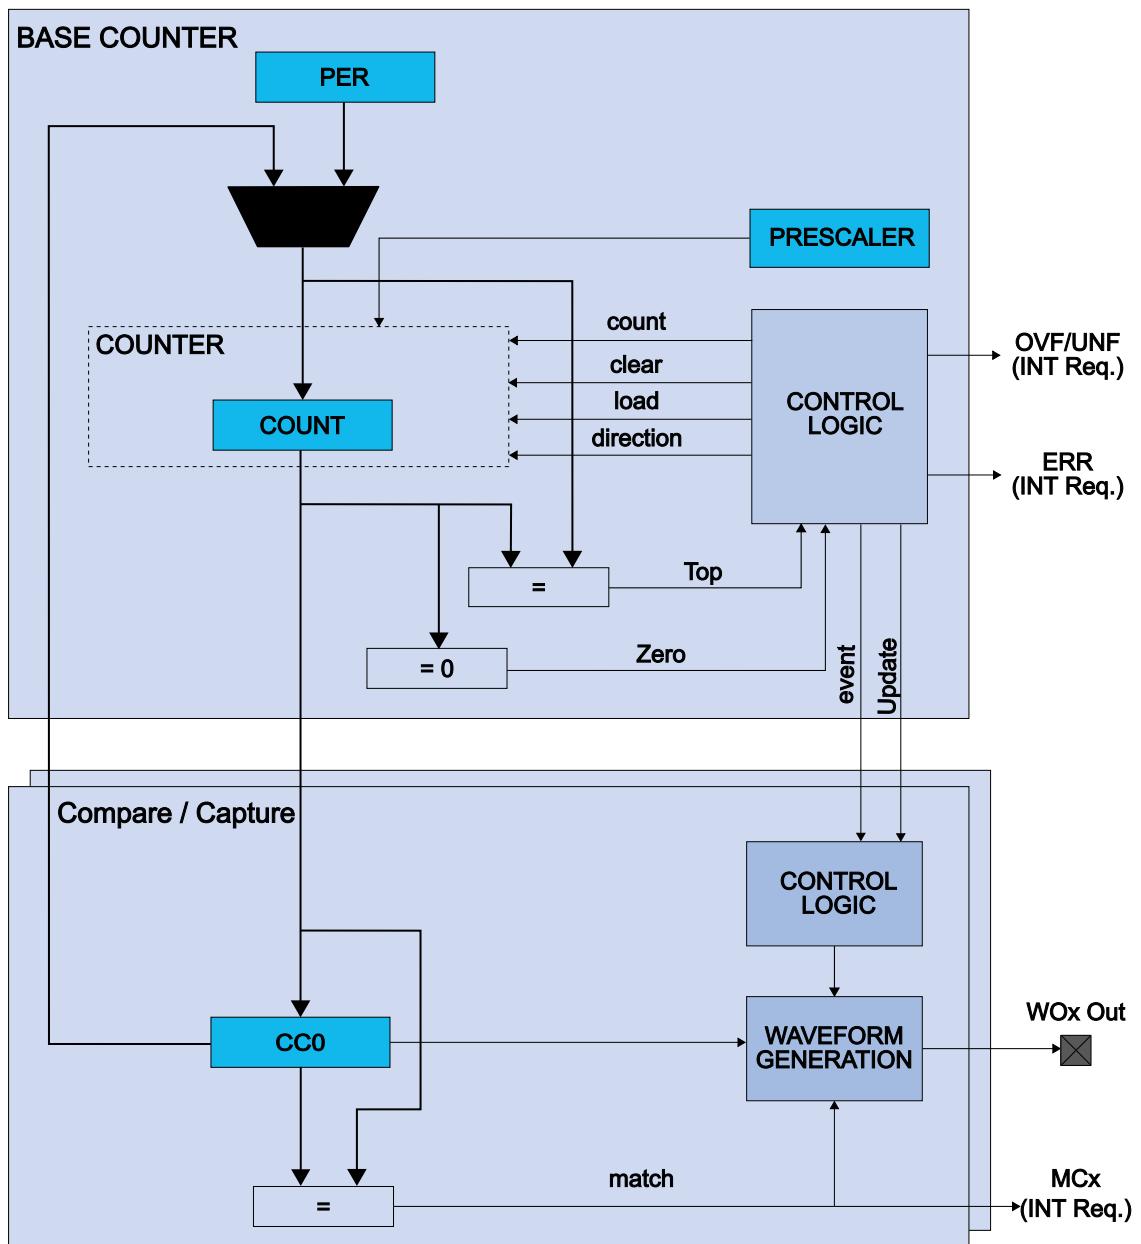

The TC consists of a counter, a prescaler, compare/capture channels and control logic. The counter can be set to count events, or it can be configured to count clock pulses. The counter, together with the compare/capture channels, can be configured to timestamp input events, allowing capture of frequency and pulse width. It can also perform waveform generation, such as frequency generation and pulse-width modulation (PWM).

### 28.2. Features

- Selectable configuration
  - Up to five 16-bit Timer/Counters (TC) including one low-power TC, each configurable as:
    - 8-bit TC with two compare/capture channels
    - 16-bit TC with two compare/capture channels
    - 32-bit TC with two compare/capture channels, by using two TCs
- Waveform generation
  - Frequency generation
  - Single-slope pulse-width modulation
- Input capture
  - Event capture
  - Frequency capture
  - Pulse-width capture
- One input event
- Interrupts/output events on:
  - Counter overflow/underflow
  - Compare match or capture
- Internal prescaler

### 28.3. Block Diagram

Figure 28-1. Timer/Counter Block Diagram

### 28.4. Signal Description

Signal Name	Type	Description
WO[1:0]	Digital output	Waveform output

Refer to *I/O Multiplexing and Considerations* for details on the pin mapping for this peripheral. One signal can be mapped on several pins.

#### Related Links

## 28.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly, as described below.

### 28.5.1. I/O Lines

In order to use the I/O lines of this peripheral, the I/O pins must be configured using the I/O Pin Controller (PORT).

#### Related Links

[PORT - I/O Pin Controller](#) on page 320

### 28.5.2. Power Management

This peripheral can continue to operate in any sleep mode where its source clock is running. The interrupts can wake up the device from sleep modes. Events connected to the event system can trigger other operations in the system without exiting sleep modes.

#### Related Links

[PM – Power Manager](#) on page 129

### 28.5.3. Clocks

The TC bus clock (CLK\_TCx\_APB, where x represents the specific TC instance number) can be enabled and disabled in the Power Manager, and the default state of CLK\_TCx\_APB can be found in the *Peripheral Clock Masking* section in “PM – Power Manager”.

The different TC instances are paired, even and odd, starting from TC0, and use the same generic clock, GCLK\_TCx. This means that the TC instances in a TC pair cannot be set up to use different GCLK\_TCx clocks.

This generic clock is asynchronous to the user interface clock (CLK\_TCx\_APB). Due to this asynchronicity, accessing certain registers will require synchronization between the clock domains. Refer to [Synchronization](#) for further details.

### 28.5.4. Interrupts

The interrupt request line is connected to the Interrupt Controller. In order to use interrupt requests of this peripheral, the Interrupt Controller (NVIC) must be configured first. Refer to *Nested Vector Interrupt Controller* for details.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 28.5.5. Events

The events of this peripheral are connected to the Event System.

#### Related Links

[EVSYS – Event System](#) on page 349

### 28.5.6. Debug Operation

When the CPU is halted in debug mode, this peripheral will halt normal operation. This peripheral can be forced to continue operation during debugging - refer to the Debug Control (DBGCTRL) register for details.

### 28.5.7. Register Access Protection

Registers with write-access can be optionally write-protected by the Peripheral Access Controller (PAC), except the following:

- Interrupt Flag register (INTFLAG)
- Status register (STATUS)
- Read Request register (READREQ)
- Count register (COUNT)
- Period register (PER)
- Compare/Capture Value registers (CCx)

**Note:** Optional write-protection is indicated by the "PAC Write-Protection" property in the register description.

When the CPU is halted in debug mode, all write-protection is automatically disabled. Write-protection does not apply for accesses through an external debugger.

### 28.5.8. Analog Connections

Not applicable.

## 28.6. Functional Description

### 28.6.1. Principle of Operation

The following definitions are used throughout the documentation:

Table 28-1. Timer/Counter Definitions

Name	Description
TOP	The counter reaches TOP when it becomes equal to the highest value in the count sequence. The TOP value can be the same as Period (PER) or the Compare Channel 0 (CC0) register value depending on the waveform generator mode in <a href="#">Waveform Output Operations</a> .
ZERO	The counter is ZERO when it contains all zeroes
MAX	The counter reaches MAX when it contains all ones
UPDATE	The timer/counter signals an update when it reaches ZERO or TOP, depending on the direction settings.
Timer	The timer/counter clock control is handled by an internal source
Counter	The clock control is handled externally (e.g. counting external events)
CC	For compare operations, the CC are referred to as "compare channels" For capture operations, the CC are referred to as "capture channels."

The counter in the TC can either count events from the Event System, or clock ticks of the GCLK\_TCx clock, which may be divided by the prescaler.

The counter value is passed to the CCx where it can be either compared to user-defined values or captured.

The compare and capture registers (CCx) and counter register (COUNT) can be configured as 8-, 16- or 32-bit registers, with according MAX values. Mode settings determine the maximum range of the counter.

In 8-bit mode, Period Value (PER) is also available. The counter range and the operating frequency determine the maximum time resolution achievable with the TC peripheral.

The TC can be set to count up or down. Under normal operation, the counter value is continuously compared to the TOP or ZERO value to determine whether the counter has reached that value.

In compare operation, the counter value is continuously compared to the values in the CCx registers. In waveform generator mode, these comparisons are used to set the waveform period or pulse width.

Capture operation can be enabled to perform input signal period and pulse width measurements, or to capture selectable edges from an IO pin or internal event from Event System.

## 28.6.2. Basic Operation

### 28.6.2.1. Initialization

The following registers are enable-protected, meaning that they can only be written when the TC is disabled (CTRLA.ENABLE =0):

- Control A register (CTRLA), except the Run Standby (RUNSTDBY), Enable (ENABLE) and Software Reset (SWRST) bits

Enable-protected bits in the CTRLA register can be written at the same time as CTRLA.ENABLE is written to '1', but not at the same time as CTRLA.ENABLE is written to '0'. Enable-protection is denoted by the "Enable-Protected" property in the register description. The following bits are enable-protected:

- Event Action bits in the Event Control register (EVCTRL.EVACT)

Before enabling the TC, the peripheral must be configured by the following steps:

1. Enable the TC bus clock (CLK\_TCx\_APB).
2. Select 8-, 16- or 32-bit counter mode via the TC Mode bit group in the Control A register (CTRLA.MODE). The default mode is 16-bit.
3. Select one wave generation operation in the Waveform Generation Operation bit group in the Control A register (CTRLA.WAVEGEN).
4. If desired, the GCLK\_TCx clock can be prescaled via the Prescaler bit group in the Control A register (CTRLA.PRESCALER).
  - If the prescaler is used, select a prescaler synchronization operation via the Prescaler and Counter Synchronization bit group in the Control A register (CTRLA.PRESYNC).
5. Select one-shot operation by writing a '1' to the One-Shot bit in the Control B Set register (CTRLBSET.ONESHOT).
6. If desired, configure the counting direction 'down' (starting from the TOP value) by writing a '1' to the Counter Direction bit in the Control B register (CTRLBSET.DIR).
7. For capture operation, enable the individual channels to capture in the Capture Channel x Enable bit group in the Control C register (CTRLC.CAPTEN).
8. If desired, enable inversion of the waveform output or IO pin input signal for individual channels via the Waveform Output Invert Enable bit group in the Control C register (CTRLC.INVEN).

### 28.6.2.2. Enabling, Disabling and Resetting

The TC is enabled by writing a '1' to the Enable bit in the Control A register (CTRLA.ENABLE). The TC is disabled by writing a zero to CTRLA.ENABLE.

The TC is reset by writing a one to the Software Reset bit in the Control A register (CTRLA.SWRST). All registers in the TC, except DBGCTRL, will be reset to their initial state, and the TC will be disabled. Refer to the CTRLA register for details.

The TC should be disabled before the TC is reset in order to avoid undefined behavior.

#### 28.6.2.3. Prescaler Selection

The GCLK\_TCx is fed into the internal prescaler.

The prescaler consists of a counter that counts up to the selected prescaler value, whereupon the output of the prescaler toggles.

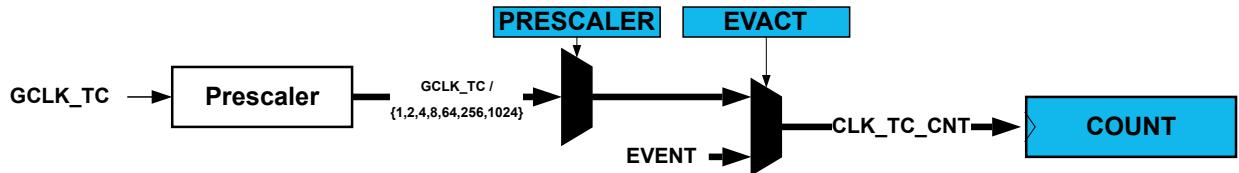

If the prescaler value is higher than one, the counter update condition can be optionally executed on the next GCLK\_TCx clock pulse or the next prescaled clock pulse. For further details, refer to Prescaler (CTRLA.PRESCALER) and Counter Synchronization (CTRLA.PRESYNC) description.

Prescaler outputs from 1 to 1/1024 are available. For a complete list of available prescaler outputs, see the register description for the Prescaler bit group in the Control A register (CTRLA.PRESCALER).

**Note:** When counting events, the prescaler is bypassed.

The joint stream of prescaler ticks and event action ticks is called CLK\_TC\_CNT.

**Figure 28-2. Prescaler**

#### 28.6.2.4. Counter Mode

The counter mode is selected by the Mode bit group in the Control A register (CTRLA.MODE). By default, the counter is enabled in the 16-bit counter resolution. Three counter resolutions are available:

- COUNT8: The 8-bit TC has its own Period register (PER). This register is used to store the period value that can be used as the top value for waveform generation.
- COUNT16: 16-bit is the default counter mode. There is no dedicated period register in this mode.
- COUNT32: This mode is achieved by pairing two 16-bit TC peripherals. TC0 is paired with TC1, and TC2 is paired with TC3. TC4 does not support 32-bit resolution.

When paired, the TC peripherals are configured using the registers of the even-numbered TC (TC0 or TC2 respectively). The odd-numbered partner (TC1 or TC3 respectively) will act as slave, and the Slave bit in the Status register (STATUS.SLAVE) will be set. The register values of a slave will not reflect the registers of the 32-bit counter. Writing to any of the slave registers will not affect the 32-bit counter. Normal access to the slave COUNT and CCx registers is not allowed.

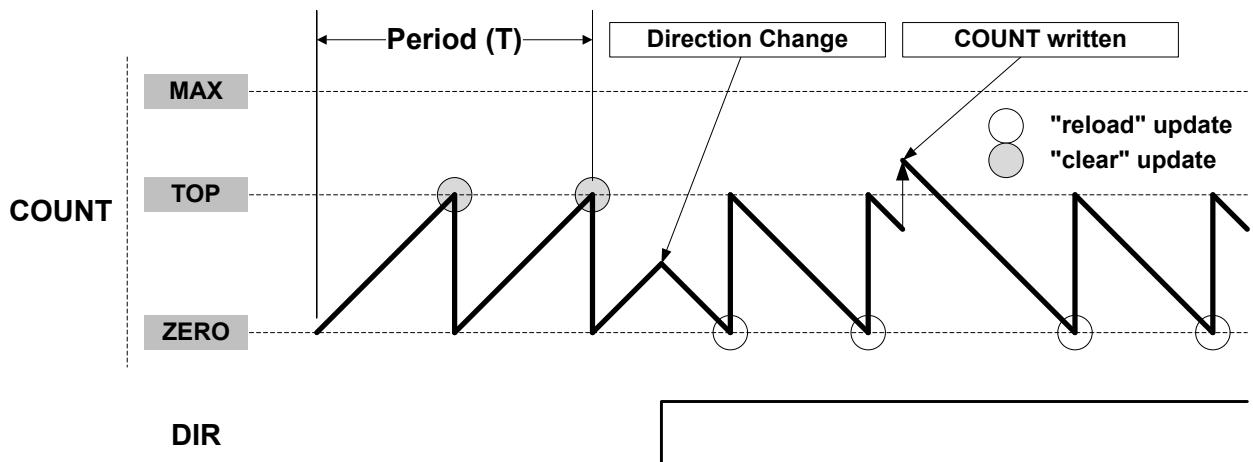

#### 28.6.2.5. Counter Operations

The counter can be set to count up or down. When the counter is counting up and the top value is reached, the counter will wrap around to zero on the next clock cycle. When counting down, the counter will wrap around to the top value when zero is reached. In one-shot mode, the counter will stop counting after a wraparound occurs.

The counting direction is set by the Direction bit in the Control B register (CTRLB.DIR). If this bit is zero the counter is counting up, and counting down if CTRLB.DIR=1. The counter will count up or down for each tick (clock or event) until it reaches TOP or ZERO. When it is counting up and TOP is reached, the counter will be set to zero at the next tick (overflow) and the Overflow Interrupt Flag in the Interrupt Flag Status and Clear register (INTFLAG.OVF) will be set. It is also possible to generate an event on overflow or underflow when the Overflow/Underflow Event Output Enable bit in the Event Control register (EVCTRL.OVFEQ) is one.

It is possible to change the counter value (by writing directly in the COUNT register) even when the counter is running. When starting the TC, the COUNT value will be either ZERO or TOP (depending on the counting direction set by CTRLBSET.DIR or CTRLBCLR.DIR), unless a different value has been written to it, or the TC has been stopped at a value other than ZERO. The write access has higher priority than count, clear, or reload. The direction of the counter can also be changed during normal operation. See also the figure below.

**Figure 28-3. Counter Operation**

#### Stop Command and Event Action

A Stop command can be issued from software by using Command bits in the Control B Set register (CTRLBSET.CMD = 0x2, STOP). When a Stop is detected while the counter is running, the counter will be loaded with the starting value (ZERO or TOP, depending on direction set by CTRLBSET.DIR or CTRLBCLR.DIR). All waveforms are cleared and the Stop bit in the Status register is set (STATUS.STOP).

#### Re-Trigger Command and Event Action

A re-trigger command can be issued from software by writing the Command bits in the Control B Set register (CTRLBSET.CMD = 0x1, RETRIGGER), or from event when a re-trigger event action is configured in the Event Control register (EVCTRL.EVACT = 0x1, RETRIGGER).

When the command is detected during counting operation, the counter will be reloaded or cleared, depending on the counting direction (CTRLBSET.DIR or CTRLBCLR.DIR). When the re-trigger command is detected while the counter is stopped, the counter will resume counting from the current value in the COUNT register.

**Note:** When a re-trigger event action is configured in the Event Action bits in the Event Control register (EVCTRL.EVACT=0x1, RETRIGGER), enabling the counter will not start the counter. The counter will start on the next incoming event and restart on corresponding following event.

#### Count Event Action

The TC can count events. When an event is received, the counter increases or decreases the value, depending on direction settings (CTRLBSET.DIR or CTRLBCLR.DIR). The count event action can be selected by the Event Action bit group in the Event Control register (EVCTRL.EVACT=0x2, COUNT).

#### Start Event Action

The TC can start counting operation on an event when previously stopped. In this configuration, the event has no effect if the counter is already counting. When the peripheral is enabled, the counter operation starts when the event is received or when a re-trigger software command is applied.

The Start TC on Event action can be selected by the Event Action bit group in the Event Control register (EVCTRL.EVACT=0x3, START).

#### 28.6.2.6. Compare Operations

By default, the Compare/Capture channel is configured for compare operations.

When using the TC and the Compare/Capture Value registers (CCx) for compare operations, the counter value is continuously compared to the values in the CCx registers. This can be used for timer or for waveform operation.

#### Waveform Output Operations

The compare channels can be used for waveform generation on output port pins. To make the waveform available on the connected pin, the following requirements must be fulfilled:

1. Choose a waveform generation mode in the Waveform Generation Operation bit in Waveform register (CTRLA.WAVEGEN).
2. Optionally invert the waveform output by writing the corresponding Waveform Output Invert Enable bit in the Control C register (CTRLC.INVx).
3. Configure the pins with the I/O Pin Controller. Refer to *PORT - I/O Pin Controller* for details.

The counter value is continuously compared with each CCx value. On a comparison match, the Match or Capture Channel x bit in the Interrupt Flag Status and Clear register (INTFLAG.MCx) will be set on the next zero-to-one transition of CLK\_TC\_CNT (see the next figure). An interrupt/and or event can be generated on comparison match when INTENSET.MCx=1 and/or EVCTRL.MCEOx=1.

There are four waveform configurations for the Waveform Generation Operation bit group in the Control A register (CTRLA.WAVEGEN) . This will influence how the waveform is generated and impose restrictions on the top value. The configurations are:

- Normal frequency (NFRQ)
- Match frequency (MFRQ)
- Normal pulse-width modulation (NPWM)
- Match pulse-width modulation (MPWM)

When using NPWM or NFRQ configuration, the TOP will be determined by the counter resolution. In 8-bit counter mode, the Period register (PER) is used as TOP, and the TOP can be changed by writing to the PER register. In 16- and 32-bit counter mode, TOP is fixed to the maximum (MAX) value of the counter.

#### Related Links

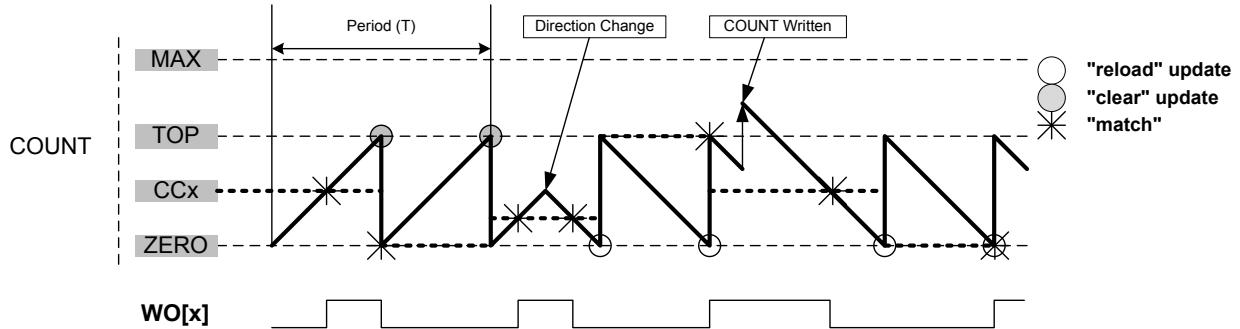

[PORT - I/O Pin Controller](#) on page 320

#### Frequency Operation

##### Normal Frequency Generation (NFRQ)

For Normal Frequency Generation, the period time (T) is controlled by the period register (PER) for 8-bit counter mode and MAX for 16- and 32-bit mode. The waveform generation output (WO[x]) is toggled on each compare match between COUNT and CCx, and the corresponding Match or Capture Channel x Interrupt Flag (INTFLAG.MCx) will be set.

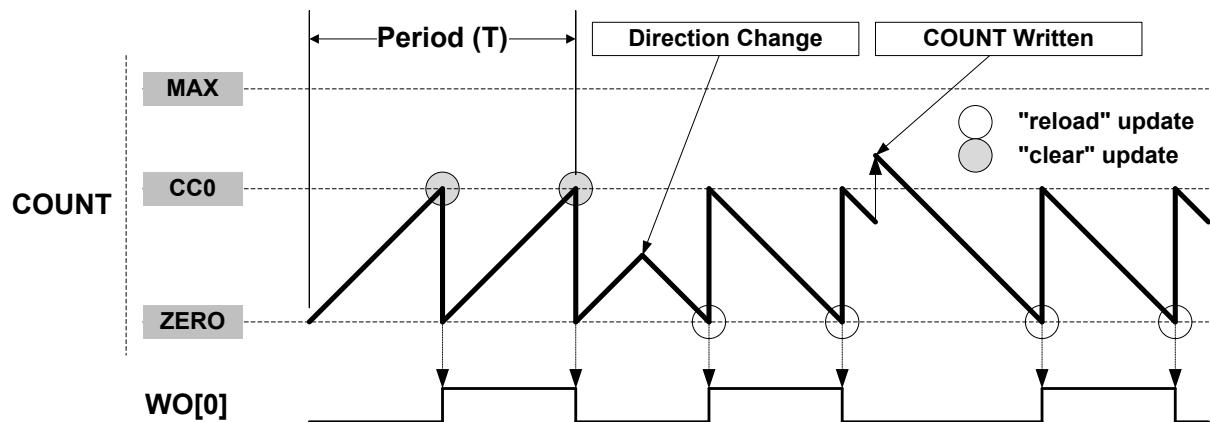

**Figure 28-4. Normal Frequency Operation**

#### Match Frequency Generation (MFRQ)

For Match Frequency Generation, the period time (T) is controlled by the CC0 register instead of PER or MAX. WO[0] toggles on each update condition.

**Figure 28-5. Match Frequency Operation**

#### PWM Operation

##### Normal Pulse-Width Modulation Operation (NPWM)

NPWM uses single-slope PWM generation.

For single-slope PWM generation, the period time (T) is controlled by the TOP value, and CCx controls the duty cycle of the generated waveform output. When up-counting, the WO[x] is set at start or compare match between the COUNT and TOP values, and cleared on compare match between COUNT and CCx register values. When down-counting, the WO[x] is cleared at start or compare match between the COUNT and ZERO values, and set on compare match between COUNT and CCx register values.

The following equation calculates the exact resolution for a single-slope PWM ( $R_{\text{PWM\_SS}}$ ) waveform:

$$R_{\text{PWM\_SS}} = \frac{\log(\text{TOP}+1)}{\log(2)}$$

The PWM frequency ( $f_{\text{PWM\_SS}}$ ) depends on TOP value and the peripheral clock frequency ( $f_{\text{GCLK\_TC}}$ ), and can be calculated by the following equation:

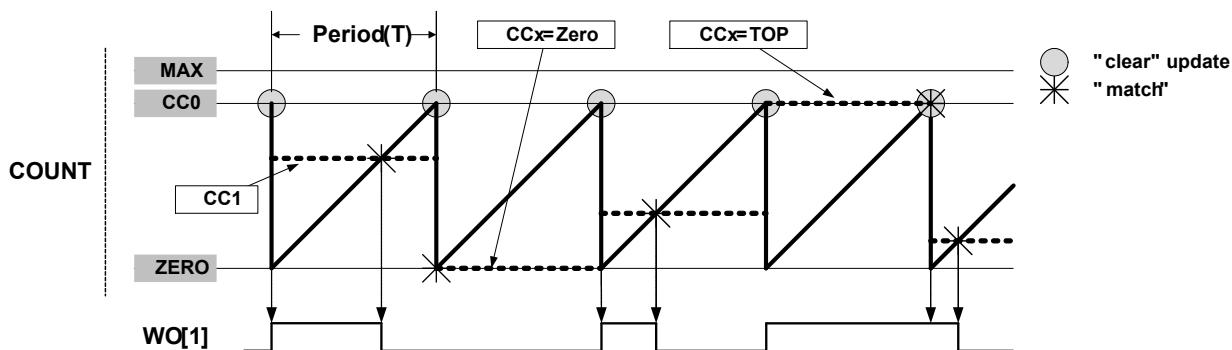

$$f_{\text{PWM\_SS}} = \frac{f_{\text{GCLK\_TC}}}{N(\text{TOP}+1)}$$

Where N represents the prescaler divider used (1, 2, 4, 8, 16, 64, 256, 1024).

##### Match Pulse-Width Modulation Operation (MPWM)

In MPWM, the output of WO[1] is depending on CC1 as shown in the figure below. On every overflow/underflow, a one-TC-clock-cycle negative pulse is put out on WO[0] (not shown in the figure).

**Figure 28-6. Match PWM Operation**

The table below shows the update counter and overflow event/interrupt generation conditions in different operation modes.

**Table 28-2. Counter Update and Overflow Event/interrupt Conditions in TC**

Name	Operation	TOP	Update	Output Waveform		OVFIF/Event	
				On Match	On Update	Up	Down
NFRQ	Normal Frequency	PER	TOP/ ZERO	Toggle	Stable	TOP	ZERO
MFRQ	Match Frequency	CC0	TOP/ ZERO	Toggle	Stable	TOP	ZERO
NPWM	Single-slope PWM	PER	TOP/ ZERO	See description above.		TOP	ZERO
MPWM	Single-slope PWM	CC0	TOP/ ZERO	Toggle	Toggle	TOP	ZERO

#### Changing the Top Value

The counter period is changed by writing a new TOP value to the Period register (PER or CC0, depending on the waveform generation mode). If a new TOP value is written when the counter value is close to zero and counting down, the counter can be reloaded with the previous TOP value, due to synchronization delays. Then, the counter will count one extra cycle before the new TOP value is used.

COUNT and TOP are continuously compared, so when a new TOP value that is lower than current COUNT is written to TOP, COUNT will wrap before a compare match.

A counter wraparound can occur in any operation mode when up-counting without buffering, see the figure below.

Figure 28-7. Changing the Top value with Up-Counting Operation

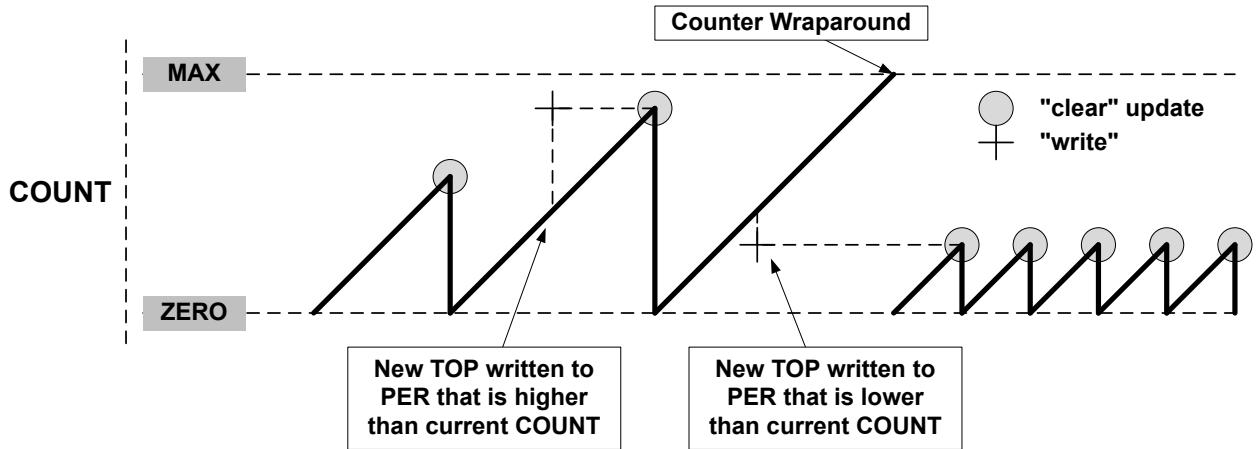

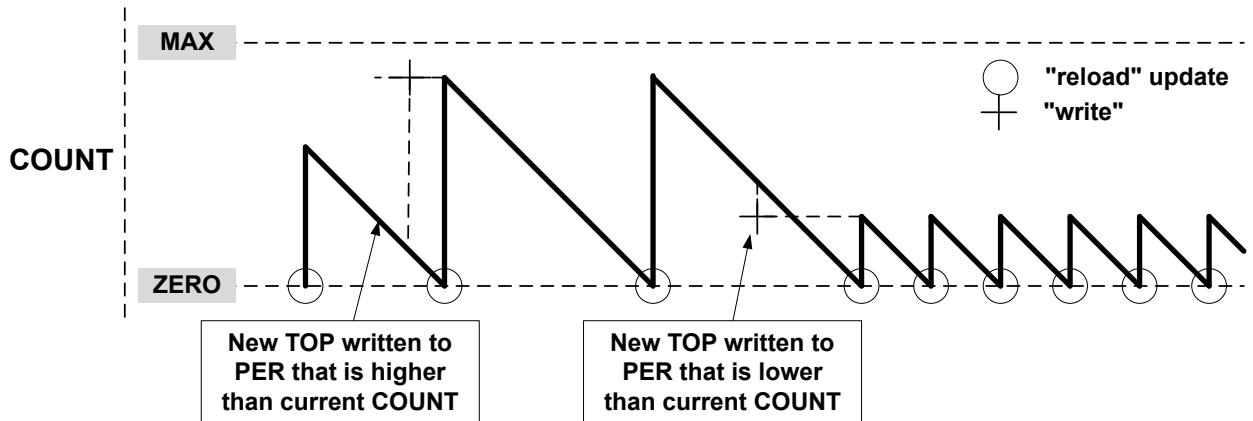

Figure 28-8. Changing the Top Value with Down-Counting Operation

#### 28.6.2.7. Capture Operations

To enable and use capture operations, the event line into the TC must be enabled using the TC Event Input bit in the Event Control register (EVCTRL.TCEI). The capture channels to be used must also be enabled in the Capture Channel x Enable bit group in the Control C register (CTRLC.CPTENx) before capture can be performed.

To enable and use capture operations, the corresponding Capture Channel x Enable bit in the Control C register (CTRLC.CAPTENx) must be written to '1'.

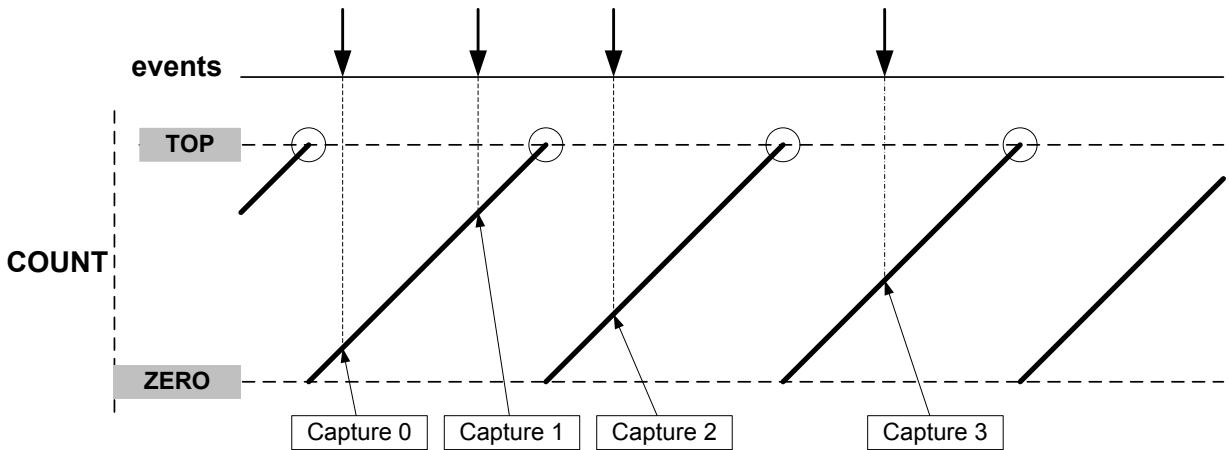

A capture trigger can be provided by asynchronous IO pin WO[x] for each capture channel or by a TC event. To enable the capture from the IO pin, the Capture On Pin x Enable bit in CTRLC register (CTRLC.COPENx) must be written to '1'.

**Note:** The RETRIGGER, COUNT and START event actions are available only on an event from the Event System.

##### Event Capture Action

The compare/capture channels can be used as input capture channels to capture events from the Event System or from the corresponding IO pin, and give them a timestamp. The following figure shows four capture events for one capture channel.

**Figure 28-9. Input Capture Timing**

The TC can detect capture overflow of the input capture channels: When a new capture event is detected while the Capture Interrupt flag (INTFLAG.MCx) is still set, the new timestamp will not be stored and INTFLAG.ERR will be set.

#### Period and Pulse-Width (PPW) Capture Action

The TC can perform two input captures and restart the counter on one of the edges. This enables the TC to measure the pulse width and period and to characterize the frequency  $f$  and duty cycle of an input signal:

$$f = \frac{1}{T} \quad \text{dutyCycle} = \frac{t_p}{T}$$

Selecting PWP (pulse-width, period) in the Event Action bit group in the Event Control register (EVCTRL.EVACT) enables the TC to perform one capture action on the rising edge and the other one on the falling edge. The period  $T$  will be captured into CC1 and the pulse width  $t_p$  in CC0.

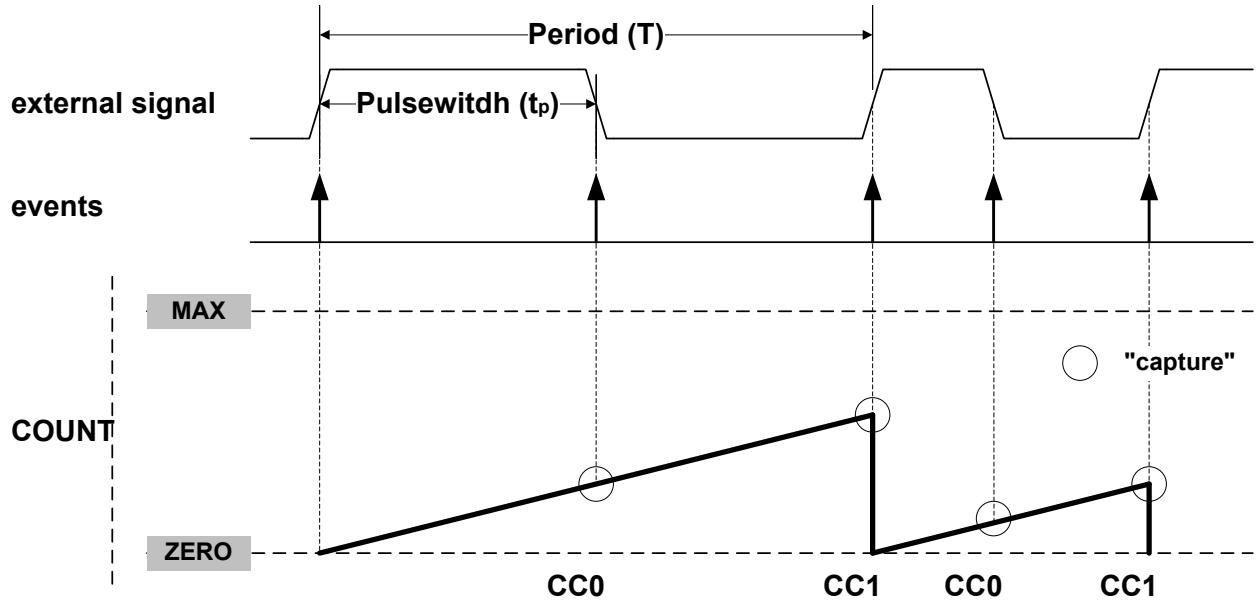

EVCTRL.EVACT=PPW (period and pulse-width) offers identical functionality, but will capture  $T$  into CC0 and  $t_p$  into CC1.

The TC Event Input Invert Enable bit in the Event Control register (EVCTRL.TCINV) is used to select whether the wraparound should occur on the rising edge or the falling edge. If EVCTRL.TCINV=1, the wraparound will happen on the falling edge.

To fully characterize the frequency and duty cycle of the input signal, activate capture on CC0 and CC1 by writing 0x3 to the Capture Channel x Enable bit group in the Control C register (CTRLC.CPTEN). When only one of these measurements is required, the second channel can be used for other purposes.

The TC can detect capture overflow of the input capture channels: When a new capture event is detected while the Capture Interrupt flag (INTFLAG.MCx) is still set, the new timestamp will not be stored and INTFLAG.ERR will be set.

Figure 28-10. PWP Capture

### 28.6.3. Additional Features

#### 28.6.3.1. One-Shot Operation

When one-shot is enabled, the counter automatically stops on the next counter overflow or underflow condition. When the counter is stopped, the Stop bit in the Status register (STATUS.STOP) is automatically set and the waveform outputs are set to zero.

One-shot operation is enabled by writing a '1' to the One-Shot bit in the Control B Set register (CTRLBSET.ONESHOT), and disabled by writing a '1' to CTRLBCLR.ONESHOT. When enabled, the TC will count until an overflow or underflow occurs and stops counting operation. The one-shot operation can be restarted by a re-trigger software command, a re-trigger event, or a start event. When the counter restarts its operation, STATUS.STOP is automatically cleared.

#### 28.6.4. Sleep Mode Operation

The TC can be configured to operate in any sleep mode. To be able to run in standby, the RUNSTDBY bit in the Control A register (CTRLA.RUNSTDBY) must be written to one. The TC can wake up the device using interrupts from any sleep mode or perform actions through the Event System.

#### 28.6.5. Synchronization

Due to asynchronicity between the main clock domain and the peripheral clock domains, some registers need to be synchronized when written or read.

The following bits are synchronized when written:

- Software Reset bit in the Control A register (CTRLA.SWRST)
- Enable bit in the Control A register (CTRLA.ENABLE)

Required write-synchronization is denoted by the "Write-Synchronized" property in the register description.

The following registers are synchronized when written:

- Control B Clear register (CTRLBCLR)

- Control B Set register (CTRLBSET)
- Control C register (CTRLC)
- Count Value register (COUNT)
- Period Value register (PERIOD)
- Compare/Capture Value registers (CCx)

Required write-synchronization is denoted by the "Write-Synchronized" property in the register description.

The following registers are synchronized when read:

- Control B Clear register (CTRLBCLR)
- Control B Set register (CTRLBSET)
- Control C register (CTRLC)
- Count Value register (COUNT)
- Period Value register (PERIOD)
- Compare/Capture Value registers (CCx)

Required read-synchronization is denoted by the "Read-Synchronized" property in the register description.

## 28.8. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16- and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers are optionally write-protected by the Peripheral Access Controller (PAC). Optional PAC write-protection is denoted by the "PAC Write-Protection" property in each individual register description. For details, refer to [Register Access Protection](#)

Some registers are synchronized when read and/or written. Synchronization is denoted by the "Write-Synchronized" or the "Read-Synchronized" property in each individual register description. For details, refer to [Synchronization](#).

Some registers are enable-protected, meaning they can only be written when the peripheral is disabled. Enable-protection is denoted by the "Enable-Protected" property in each individual register description.

### 28.8.1. Control A

**Name:** CTRLA

**Offset:** 0x00

**Reset:** 0x00000000

**Property:** PAC Write-Protection, Write-Synchronized, Enable-Protected

Bit	15	14	13	12	11	10	9	8
			PRESCSYNC[1:0]	RUNSTDBY		PRESCALER[2:0]		
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
		WAVEGEN[1:0]			MODE[1:0]		ENABLE	SWRST
Access	R/W	R/W			R/W	R/W	R/W	R/W
Reset	0	0			0	0	0	0

#### Bits 13:12 – PRESCSYNC[1:0]: Prescaler and Counter Synchronization

These bits select whether the counter should wrap around on the next GCLK\_TCx clock or the next prescaled GCLK\_TCx clock. It also makes it possible to reset the prescaler.

These bits are not synchronized.

Value	Name	Description
0x0	GCLK	Reload or reset the counter on next generic clock
0x1	PRESC	Reload or reset the counter on next prescaler clock
0x2	RESYNC	Reload or reset the counter on next generic clock. Reset the prescaler counter
0x3	-	Reserved

#### Bit 11 – RUNSTDBY: Run in Standby

This bit is used to keep the TC running in standby mode.

This bit is not synchronized.

Value	Description
0	The TC is halted in standby.
1	The TC continues to run in standby.

#### Bits 10:8 – PRESCALER[2:0]: Prescaler

These bits select the counter prescaler factor.

These bits are not synchronized.

Value	Name	Description
0x0	DIV1	Prescaler: GCLK_TC
0x1	DIV2	Prescaler: GCLK_TC/2
0x2	DIV4	Prescaler: GCLK_TC/4

Value	Name	Description
0x3	DIV8	Prescaler: GCLK_TC/8
0x4	DIV16	Prescaler: GCLK_TC/16
0x5	DIV64	Prescaler: GCLK_TC/64
0x6	DIV256	Prescaler: GCLK_TC/256
0x7	DIV1024	Prescaler: GCLK_TC/1024

#### Bits 6:5 – WAVEGEN[1:0]: Waveform Generation Operation

These bits select the waveform generation operation. They affect the top value, as shown in “Waveform Output Operations”. It also controls whether frequency or PWM waveform generation should be used. How these modes differ can also be seen from “Waveform Output Operations”.

These bits are not synchronized.

Table 28-6. Waveform Generation Operation

Value	Name	Operation	Top Value	Waveform Output on Match	Waveform Output on Wraparound
0x0	NFRQ	Normal frequency	PER <sup>(1)</sup> /Max	Toggle	No action
0x1	MFRQ	Match frequency	CC0	Toggle	No action
0x2	NPWM	Normal PWM	PER <sup>(1)</sup> /Max	Clear when counting up Set when counting down	Set when counting up Clear when counting down
0x3	MPWM	Match PWM	CC0	Clear when counting up Set when counting down	Set when counting up Clear when counting down

#### Note:

1. This depends on the TC mode. In 8-bit mode, the top value is the Period Value register (PER). In 16- and 32-bit mode it is the maximum value.

#### Bits 3:2 – MODE[1:0]: Timer Counter Mode

These bits select the counter mode.

These bits are not synchronized.

Value	Name	Description
0x0	COUNT16	Counter in 16-bit mode
0x1	COUNT8	Counter in 8-bit mode
0x2	COUNT32	Counter in 32-bit mode
0x3	-	Reserved

**Bit 1 – ENABLE: Enable**

Due to synchronization, there is delay from writing CTRLA.ENABLE until the peripheral is enabled/disabled. The value written to CTRLA.ENABLE will read back immediately, and the ENABLE Synchronization Busy bit in the SYNCBUSY register (SYNCBUSY.ENABLE) will be set. SYNCBUSY.ENABLE will be cleared when the operation is complete.

This bit is not enable protected.

Value	Description
0	The peripheral is disabled.
1	The peripheral is enabled.

**Bit 0 – SWRST: Software Reset**

Writing a '0' to this bit has no effect.

Writing a '1' to this bit resets all registers in the TC, except DBGCTRL, to their initial state, and the TC will be disabled.

Writing a '1' to CTRLA.SWRST will always take precedence; all other writes in the same write-operation will be discarded.

Due to synchronization there is a delay from writing CTRLA.SWRST until the reset is complete. CTRLA.SWRST and SYNCBUSY.SWRST will both be cleared when the reset is complete.

This bit is not enable protected.

Value	Description
0	There is no reset operation ongoing.
1	The reset operation is ongoing.

## 28.8.2. Read Request

**Name:** READREQ

**Offset:** 0x02

**Reset:** 0x0000

**Property:**

Bit	15	14	13	12	11	10	9	8
	RREQ	RCONT						
Access	W	R/W						
Reset	0	0						
Bit	7	6	5	4	3	2	1	0
						ADDR[4:0]		
Access				R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0

### Bit 15 – RREQ: Read Request

Writing a zero to this bit has no effect.

This bit will always read as zero.

Writing a one to this bit requests synchronization of the register pointed to by the Address bit group (READREQ.ADDR) and sets the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY).

### Bit 14 – RCONT: Read Continuously

When continuous synchronization is enabled, the register pointed to by the Address bit group (READREQ.ADDR) will be synchronized automatically every time the register is updated.

Value	Description
0	Continuous synchronization is disabled.
1	Continuous synchronization is enabled.

### Bits 4:0 – ADDR[4:0]: Address

These bits select the offset of the register that needs read synchronization. In the TC, only COUNT and CCx are available for read synchronization.

### 28.8.3. Control B Clear

This register allows the user to clear bits in the CTRLB register without doing a read-modify-write operation. Changes in this register will also be reflected in the Control B Set register (CTRLBSET).

**Name:** CTRLBCLR

**Offset:** 0x04

**Reset:** 0x00

**Property:** PAC Write-Protection, Read-Synchronized, Write-Synchronized

Bit	7	6	5	4	3	2	1	0
	CMD[1:0]					ONESHOT		DIR
Access	R/W	R/W				R/W		R/W
Reset	0	0				0		0

#### Bits 7:6 – CMD[1:0]: Command

These bits are used for software control of the TC. The commands are executed on the next prescaled GCLK\_TC clock cycle. When a command has been executed, the CMD bit group will be read back as zero.

Writing 0x0 to these bits has no effect.

Writing a '1' to any of these bits will clear the pending command.

**Table 28-7. Command**

Value	Name	Description
0x0	NONE	No action
0x1	RETRIGGER	Force a start, restart or retrigger
0x2	STOP	Force a stop
0x3	-	Reserved

#### Bit 2 – ONESHOT: One-Shot on Counter

This bit controls one-shot operation of the TC.

Writing a '0' to this bit has no effect

Writing a '1' to this bit will disable one-shot operation.

Value	Description
0	The TC will wrap around and continue counting on an overflow/underflow condition.
1	The TC will wrap around and stop on the next underflow/overflow condition.

#### Bit 0 – DIR: Counter Direction

This bit is used to change the direction of the counter.

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will clear the bit and make the counter count up.

Value	Description
0	The timer/counter is counting up (incrementing).
1	The timer/counter is counting down (decrementing).

#### 28.8.4. Control B Set

This register allows the user to set bits in the CTRLB register without doing a read-modify-write operation. Changes in this register will also be reflected in the Control B Clear register (CTRLBCLR).

**Name:** CTRLBSET

**Offset:** 0x05

**Reset:** 0x00

**Property:** PAC Write-Protection, Read-synchronized, Write-Synchronized

Bit	7	6	5	4	3	2	1	0
	CMD[1:0]					ONESHOT		DIR
Access	R/W	R/W				R/W		R/W
Reset	0	0				0		0

#### Bits 7:6 – CMD[1:0]: Command

These bits are used for software control of the TC. The commands are executed on the next prescaled GCLK\_TC clock cycle. When a command has been executed, the CMD bit group will be read back as zero.

Writing 0x0 to these bits has no effect.

Writing a '1' to any of these bits will clear the pending command.

Table 28-8. Command

Value	Name	Description
0x0	NONE	No action
0x1	RETRIGGER	Force a start, restart or retrigger
0x2	STOP	Force a stop
0x3	-	Reserved

#### Bit 2 – ONESHOT: One-Shot on Counter

This bit controls one-shot operation of the TC.

Writing a '0' to this bit has no effect

Writing a '1' to this bit will disable one-shot operation.

Value	Description
0	The TC will wrap around and continue counting on an overflow/underflow condition.
1	The TC will wrap around and stop on the next underflow/overflow condition.

#### Bit 0 – DIR: Counter Direction

This bit is used to change the direction of the counter.

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will clear the bit and make the counter count up.

Value	Description
0	The timer/counter is counting up (incrementing).
1	The timer/counter is counting down (decrementing).

## 28.8.5. Control C

**Name:** CTRLC

**Offset:** 0x06

**Reset:** 0x00

**Property:** PAC Write-Protection, Read-synchronized, Write-Synchronized

Bit	7	6	5	4	3	2	1	0
Access			CPTEN1	CPTEN0			INVEN1	INVEN0
Reset			R/W	R/W			R/W	R/W
			0	0			0	0

### Bits 5,4 – CPTENx: Capture Channel x Enable

These bits are used to select the capture or compare operation on channel x.

Writing a '1' to CPTENx enables capture on channel x.

Writing a '0' to CPTENx disables capture on channel x.

### Bits 1,0 – INVENx: Waveform Output x Inversion Enable

These bits are used to select inversion on the output of channel x.

Writing a '1' to INVENx inverts output from WO[x].

Writing a '0' to INVENx disables inversion of output from WO[x].

## 28.8.6. Debug Control

**Name:** DBGCTRL  
**Offset:** 0x08  
**Reset:** 0x00  
**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access								DBGRUN
Reset								0

### Bit 0 – DBGRUN: Debug Run Mode

This bit is not affected by a software reset, and should not be changed by software while the TC is enabled.

Value	Description
0	The TC is halted when the device is halted in debug mode.
1	The TC continues normal operation when the device is halted in debug mode.

### 28.8.7. Event Control

**Name:** EVCTRL  
**Offset:** 0x0A  
**Reset:** 0x0000  
**Property:** PAC Write-Protection, Enable-Protected

Bit	15	14	13	12	11	10	9	8
			MCEO1	MCEO0				OVFEO
Access			R/W	R/W				R/W
Reset			0	0				0
Bit	7	6	5	4	3	2	1	0
			TCEI	TCINV			EVACT[2:0]	
Access			R/W	R/W		R/W	R/W	R/W
Reset			0	0		0	0	0

#### Bits 13,12 – MCEO<sub>x</sub>: Match or Capture Channel x Event Output Enable [x = 1..0]

These bits enable the generation of an event for every match or capture on channel x.

Value	Description
0	Match/Capture event on channel x is disabled and will not be generated.
1	Match/Capture event on channel x is enabled and will be generated for every compare/capture.

#### Bit 8 – OVFEO: Overflow/Underflow Event Output Enable

This bit enables the Overflow/Underflow event. When enabled, an event will be generated when the counter overflows/underflows.

Value	Description
0	Overflow/Underflow event is disabled and will not be generated.
1	Overflow/Underflow event is enabled and will be generated for every counter overflow/underflow.

#### Bit 5 – TCEI: TC Event Enable

This bit is used to enable asynchronous input events to the TC.

Value	Description
0	Incoming events are disabled.
1	Incoming events are enabled.

#### Bit 4 – TCINV: TC Inverted Event Input Polarity

This bit inverts the asynchronous input event source.

Value	Description
0	Input event source is not inverted.
1	Input event source is inverted.

**Bits 2:0 – EVACT[2:0]: Event Action**

These bits define the event action the TC will perform on an event.

Value	Name	Description
0x0	OFF	Event action disabled
0x1	RETRIGGER	Start, restart or retrigger TC on event
0x2	COUNT	Count on event
0x3	START	Start TC on event
0x4	-	Reserved
0x5	PPW	Period captured in CC0, pulse width in CC1
0x6	PWP	Period captured in CC1, pulse width in CC0
0x7	-	Reserved

### 28.8.8. Interrupt Enable Clear

This register allows the user to disable an interrupt without doing a read-modify-write operation. Changes in this register will also be reflected in the Interrupt Enable Set register (INTENSET).

**Name:** INTENCLR

**Offset:** 0x0C

**Reset:** 0x00

**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access			MC1	MC0	SYNCRDY		ERR	OVF
Reset			R/W	R/W	R/W		R/W	R/W

#### Bits 5,4 – MCx: Match or Capture Channel x Interrupt Enable [x = 1..0]

Writing a '0' to these bits has no effect.

Writing a '1' to MCx will clear the corresponding Match or Capture Channel x Interrupt Enable bit, which disables the Match or Capture Channel x interrupt.

Value	Description
0	The Match or Capture Channel x interrupt is disabled.
1	The Match or Capture Channel x interrupt is enabled.

#### Bit 3 – SYNCRDY: Synchronization Ready Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a one to this bit will clear the Synchronization Ready Interrupt Disable/Enable bit, which disables the Synchronization Ready interrupt.

Value	Description
0	The Synchronization Ready interrupt is disabled.
1	The Synchronization Ready interrupt is enabled.

#### Bit 1 – ERR: Error Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will clear the Error Interrupt Enable bit, which disables the Error interrupt.

Value	Description
0	The Error interrupt is disabled.
1	The Error interrupt is enabled.

#### Bit 0 – OVF: Overflow Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will clear the Overflow Interrupt Enable bit, which disables the Overflow interrupt request.

Value	Description
0	The Overflow interrupt is disabled.
1	The Overflow interrupt is enabled.

### 28.8.9. Interrupt Enable Set

This register allows the user to enable an interrupt without doing a read-modify-write operation. Changes in this register will also be reflected in the Interrupt Enable Clear register (INTENCLR).

**Name:** INTENSET

**Offset:** 0x0D

**Reset:** 0x00

**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access			MC1	MC0	SYNCRDY		ERR	OVF
Reset			R/W	R/W	R/W		R/W	R/W

#### Bits 5,4 – MCx: Match or Capture Channel x Interrupt Enable [x = 1..0]

Writing a '0' to these bits has no effect.

Writing a '1' to MCx will set the corresponding Match or Capture Channel x Interrupt Enable bit, which enables the Match or Capture Channel x interrupt.

Value	Description
0	The Match or Capture Channel x interrupt is disabled.
1	The Match or Capture Channel x interrupt is enabled.

#### Bit 3 – SYNCRDY: Synchronization Ready Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a one to this bit will clear the Synchronization Ready Interrupt Disable/Enable bit, which disables the Synchronization Ready interrupt.

Value	Description
0	The Synchronization Ready interrupt is disabled.
1	The Synchronization Ready interrupt is enabled.

#### Bit 1 – ERR: Error Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will set the Error Interrupt Enable bit, which enables the Error interrupt.

Value	Description
0	The Error interrupt is disabled.
1	The Error interrupt is enabled.

#### Bit 0 – OVF: Overflow Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will set the Overflow Interrupt Enable bit, which enables the Overflow interrupt request.

Value	Description
0	The Overflow interrupt is disabled.
1	The Overflow interrupt is enabled.

### 28.8.10. Interrupt Flag Status and Clear

**Name:** INTFLAG

**Offset:** 0x0E

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0
			MC1	MC0	SYNCRDY		ERR	OVF
Access			R/W	R/W	R/W		R/W	R/W
Reset			0	0	0		0	0

#### Bits 5,4 – MCx: Match or Capture Channel x [x = 1..0]

This flag is set on a comparison match, or when the corresponding CCx register contains a valid capture value. This flag is set on the next CLK\_TC\_CNT cycle, and will generate an interrupt request if the corresponding Match or Capture Channel x Interrupt Enable bit in the Interrupt Enable Set register (INTENSET.MCx) is '1'.

Writing a '0' to one of these bits has no effect.

Writing a '1' to one of these bits will clear the corresponding Match or Capture Channel x interrupt flag.

In capture operation, this flag is automatically cleared when CCx register is read.

#### Bit 3 – SYNCRDY: Synchronization Ready Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a one to this bit will clear the Synchronization Ready Interrupt Disable/Enable bit, which disables the Synchronization Ready interrupt.

Value	Description
0	The Synchronization Ready interrupt is disabled.
1	The Synchronization Ready interrupt is enabled.

#### Bit 1 – ERR: Error Interrupt Flag

This flag is set when a new capture occurs on a channel while the corresponding Match or Capture Channel x interrupt flag is set, in which case there is nowhere to store the new capture.

Writing a '0' to this bit has no effect.

Writing a '1' to this bit clears the Error interrupt flag.

#### Bit 0 – OVF: Overflow Interrupt Flag

This flag is set on the next CLK\_TC\_CNT cycle after an overflow condition occurs, and will generate an interrupt request if INTENCLR.OVF or INTENSET.OVF is '1'.

Writing a '0' to this bit has no effect.

Writing a '1' to this bit clears the Overflow interrupt flag.

### 28.8.11. Status

**Name:** STATUS

**Offset:** 0x0F

**Reset:** 0x08

**Property:** -

Bit	7	6	5	4	3	2	1	0
	SYNCBUSY			SLAVE	STOP			
Access	R			R	R			
Reset	0			0	1			

#### Bit 7 – SYNCBUSY: Synchronization Busy

This bit is cleared when the synchronization of registers between the clock domains is complete.

This bit is set when the synchronization of registers between clock domains is started.

#### Bit 4 – SLAVE: Slave Status Flag

This bit is only available in 32-bit mode on the slave TC (i.e., TC1 and/or TC3). The bit is set when the associated master TC (TC0 and TC2, respectively) is set to run in 32-bit mode.

#### Bit 3 – STOP: Stop Status Flag

This bit is set when the TC is disabled, on a Stop command, or on an overflow/underflow condition when the One-Shot bit in the Control B Set register (CTRLBSET.ONESHOT) is '1'.

Value	Description
0	Counter is running.
1	Counter is stopped.

### 28.8.12. Counter Value

### 28.8.12.1. Counter Value, 8-bit Mode

**Name:** COUNT

**Offset:** 0x10

**Reset:** 0x00

**Property:** PAC Write-Protection, Write-Synchronized, Read-Synchronized

Bit	7	6	5	4	3	2	1	0
COUNT[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 7:0 – COUNT[7:0]: Counter Value

These bits contain the current counter value.

### 28.8.12.2. Counter Value, 16-bit Mode

**Name:** COUNT

**Offset:** 0x10

**Reset:** 0x00

**Property:** PAC Write-Protection, Write-Synchronized, Read-Synchronized

Bit	15	14	13	12	11	10	9	8
COUNT[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
COUNT[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – COUNT[15:0]: Counter Value

These bits contain the current counter value.

### 28.8.12.3. Counter Value, 32-bit Mode

**Name:** COUNT

**Offset:** 0x10

**Reset:** 0x00

**Property:** PAC Write-Protection, Write-Synchronized, Read-Synchronized

Bit	31	30	29	28	27	26	25	24
COUNT[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
COUNT[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
COUNT[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
COUNT[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – COUNT[31:0]: Counter Value

These bits contain the current counter value.

### 28.8.13. Period Value

### 28.8.13.1. Period Value, 8-bit Mode

**Name:** PER

**Offset:** 0x14

**Reset:** 0xFF

**Property:** Write-Synchronized

Bit	7	6	5	4	3	2	1	0
PER[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	1

#### Bits 7:0 – PER[7:0]: Period Value

These bits hold the value of the Period Buffer register PERBUF. The value is copied to PER register on UPDATE condition.

### 28.8.14. Compare/Capture

#### 28.8.14.1. Channel x Compare/Capture Value, 8-bit Mode

**Name:** CCx

**Offset:** 0x18+i\*0x1 [i=0..1]

**Reset:** 0x00

**Property:** Write-Synchronized

Bit	7	6	5	4	3	2	1	0
CC[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 7:0 – CC[7:0]: Channel x Compare/Capture Value

These bits contain the compare/capture value in 8-bit TC mode. In Match frequency (MFRQ) or Match PWM (MPWM) waveform operation (CTRLA.WAVEGEN), the CC0 register is used as a period register.

#### 28.8.14.2. Channel x Compare/Capture Value, 16-bit Mode

**Name:** CCx

**Offset:** 0x18+i\*0x2 [i=0..1]

**Reset:** 0x0000

**Property:** Write-Synchronized

Bit	15	14	13	12	11	10	9	8
CC[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
CC[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – CC[15:0]: Channel x Compare/Capture Value

These bits contain the compare/capture value in 16-bit TC mode. In Match frequency (MFRQ) or Match PWM (MPWM) waveform operation (CTRLA.WAVEGEN), the CC0 register is used as a period register.

### 28.8.14.3. Channel x Compare/Capture Value, 32-bit Mode

**Name:** CCx  
**Offset:** 0x18+i\*0x4 [i=0..1]  
**Reset:** 0x00000000  
**Property:** Write-Synchronized

Bit	31	30	29	28	27	26	25	24
CC[31:24]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
CC[23:16]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
CC[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
CC[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – CC[31:0]: Channel x Compare/Capture Value

These bits contain the compare/capture value in 32-bit TC mode. In Match frequency (MFRQ) or Match PWM (MPWM) waveform operation (CTRLA.WAVEGEN), the CC0 register is used as a period register.

## 29. ADC – Analog-to-Digital Converter

### 29.1. Overview

The Analog-to-Digital Converter (ADC) converts analog signals to digital values. The ADC has 12-bit resolution, and is capable of converting up to 350ksps. The input selection is flexible, and both differential and single-ended measurements can be performed. An optional gain stage is available to increase the dynamic range. In addition, several internal signal inputs are available. The ADC can provide both signed and unsigned results.

ADC measurements can be started by either application software or an incoming event from another peripheral in the device. ADC measurements can be started with predictable timing, and without software intervention.

Both internal and external reference voltages can be used.

An integrated temperature sensor is available for use with the ADC. The bandgap voltage as well as the scaled I/O and core voltages can also be measured by the ADC.

The ADC has a compare function for accurate monitoring of user-defined thresholds, with minimum software intervention required.

The ADC may be configured for 8-, 10- or 12-bit results, reducing the conversion time. ADC conversion results are provided left- or right-adjusted, which eases calculation when the result is represented as a signed value.

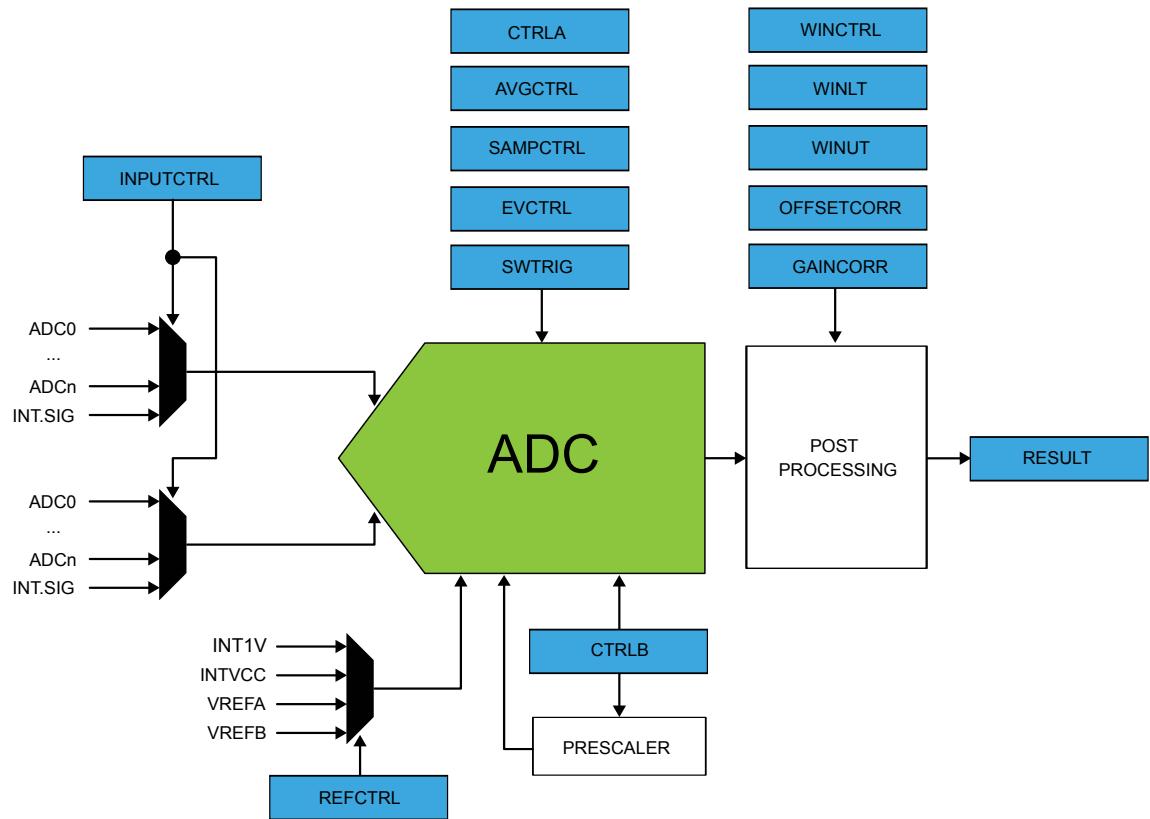

### 29.2. Features

- 8-, 10- or 12-bit resolution
- Up to 350,000 samples per second (350ksps)
- Differential and single-ended inputs
  - Up to 32 analog input
  - 25 positive and 10 negative, including internal and external
- Five internal inputs
  - Bandgap
  - Temperature sensor
  - DAC
  - Scaled core supply
  - Scaled I/O supply
- 1/2x to 16x gain
- Single, continuous and pin-scan conversion options
- Windowing monitor with selectable channel
- Conversion range:
  - $V_{ref}$  [1v to  $V_{DDANA} - 0.6V$ ]
  - $ADCx * GAIN$  [0V to  $-V_{ref}$ ]
- Built-in internal reference and external reference options
  - Four bits for reference selection
- Event-triggered conversion for accurate timing (one event input)

- Hardware gain and offset compensation
- Averaging and oversampling with decimation to support, up to 16-bit result
- Selectable sampling time

### 29.3. Block Diagram

Figure 29-1. ADC Block Diagram

### 29.4. Signal Description

Signal Name	Type	Description
VREFA	Analog input	External reference voltage A
VREFB	Analog input	External reference voltage B
ADC[19..0] <sup>(1)</sup>	Analog input	Analog input channels

**Note:** Refer to *Configuration Summary* for details on exact number of analog input channels.

**Note:** Refer to *I/O Multiplexing and Considerations* for details on the pin mapping for this peripheral. One signal can be mapped on several pins.

#### Related Links

[I/O Multiplexing and Considerations](#) on page 27

[Configuration Summary](#) on page 11

## 29.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly, as described below.

### 29.5.1. I/O Lines

Using the ADC's I/O lines requires the I/O pins to be configured using the port configuration (PORT).

#### Related Links

[PORT - I/O Pin Controller](#) on page 320

### 29.5.2. Power Management

The ADC will continue to operate in any sleep mode where the selected source clock is running. The ADC's interrupts can be used to wake up the device from sleep modes. Events connected to the event system can trigger other operations in the system without exiting sleep modes.

#### Related Links

[PM – Power Manager](#) on page 129

### 29.5.3. Clocks

The ADC can be enabled in the Main Clock, which also defines the default state.

This clock must be configured and enabled in the Generic Clock Controller (GCLK) before using the ADC.

A generic clock is asynchronous to the bus clock. Due to this asynchronicity, writes to certain registers will require synchronization between the clock domains. Refer to *Synchronization* for further details.

#### Related Links

[GCLK - Generic Clock Controller](#) on page 108

### 29.5.4. Interrupts

The interrupt request line is connected to the interrupt controller. Using the ADC interrupt requires the interrupt controller to be configured first.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 29.5.5. Events

The events are connected to the Event System.

#### Related Links

[EVSYS – Event System](#) on page 349

### 29.5.6. Debug Operation

When the CPU is halted in debug mode the ADC will halt normal operation. The ADC can be forced to continue operation during debugging.

### 29.5.7. Register Access Protection

All registers with write-access are optionally write-protected by the peripheral access controller (PAC), except the following register:

- Interrupt Flag Status and Clear (INTFLAG) register

Optional write-protection by the Peripheral Access Controller (PAC) is denoted by the "PAC Write-Protection" property in each individual register description.

PAC write-protection does not apply to accesses through an external debugger.

#### Related Links

[PAC - Peripheral Access Controller](#) on page 45

### 29.5.8. Analog Connections

I/O-pins AIN0 to AIN19 as well as the VREFA/VREFB reference voltage pin are analog inputs to the ADC.

### 29.5.9. Calibration

The values BIAS\_CAL and LINEARITY\_CAL from the production test must be loaded from the NVM Software Calibration Area into the ADC Calibration register (CALIB) by software to achieve specified accuracy.

## 29.6. Functional Description

### 29.6.1. Principle of Operation

By default, the ADC provides results with 12-bit resolution. 8-bit or 10-bit results can be selected in order to reduce the conversion time.

The ADC has an oversampling with decimation option that can extend the resolution to 16 bits. The input values can be either internal (e.g., internal temperature sensor) or external (connected I/O pins). The user can also configure whether the conversion should be single-ended or differential.

### 29.6.2. Basic Operation

#### 29.6.2.1. Initialization

Before enabling the ADC, the asynchronous clock source must be selected and enabled, and the ADC reference must be configured. The first conversion after the reference is changed must not be used. All other configuration registers must be stable during the conversion. The source for GCLK\_ADC is selected and enabled in the System Controller (SYSCTRL). Refer to *SYSCTRL – System Controller* for more details.

When GCLK\_ADC is enabled, the ADC can be enabled by writing a one to the Enable bit in the Control Register A (CTRLA.ENABLE).

#### Related Links

[SYSCTRL – System Controller](#) on page 162

#### 29.6.2.2. Enabling, Disabling and Reset

The ADC is enabled by writing a '1' to the Enable bit in the Control A register (CTRLA.ENABLE). The ADC is disabled by writing CTRLA.ENABLE=0. The ADC is reset by writing a '1' to the Software Reset bit in the Control A register (CTRLA.SWRST). All registers in the ADC, except DBGCTRL, will be reset to their initial state, and the ADC will be disabled.

The ADC must be disabled before it is reset.

#### 29.6.2.3. Operation

In the most basic configuration, the ADC samples values from the configured internal or external sources (INPUTCTRL register). The rate of the conversion depends on the combination of the GCLK\_ADCx frequency and the clock prescaler.

To convert analog values to digital values, the ADC needs to be initialized first, as described in [Initialization](#). Data conversion can be started either manually by setting the Start bit in the Software

Trigger register (SWTRIG.START=1), or automatically by configuring an automatic trigger to initiate the conversions. A free-running mode can be used to continuously convert an input channel. When using free-running mode the first conversion must be started, while subsequent conversions will start automatically at the end of previous conversions.

The automatic trigger can be configured to trigger on many different conditions.

The result of the conversion is stored in the Result register (RESULT) overwriting the result from the previous conversion.

To avoid data loss if more than one channel is enabled, the conversion result must be read as soon as it is available (INTFLAG.RESRDY). Failing to do so will result in an overrun error condition, indicated by the OVERRUN bit in the Interrupt Flag Status and Clear register (INTFLAG.OVERRUN). When the RESRDY interrupt flag is set, the new result has been synchronized to the RESULT register.

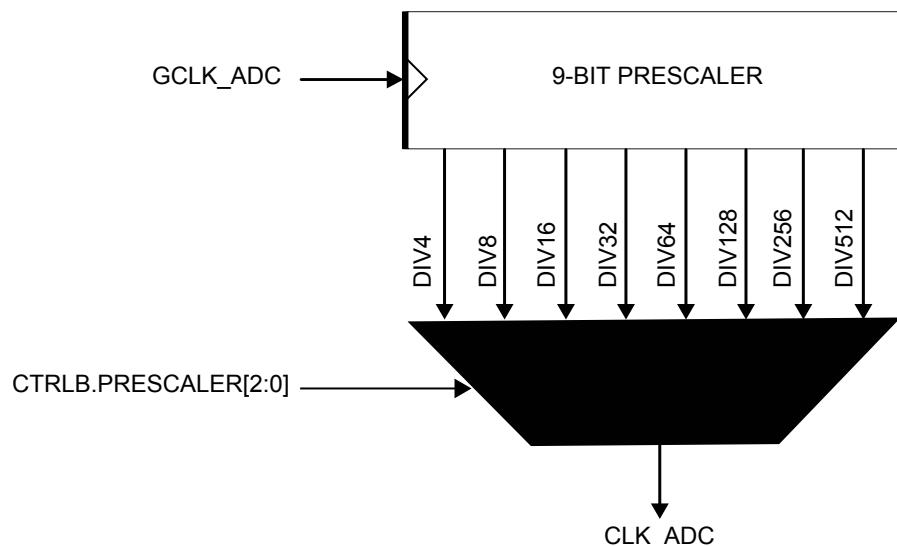

To enable one of the available interrupts sources, the corresponding bit in the Interrupt Enable Set register (INTENSET) must be written to '1'.

### 29.6.3. Prescaler

The ADC is clocked by GCLK\_ADC. There is also a prescaler in the ADC to enable conversion at lower clock rates.

Refer to CTRLB for details on prescaler settings.

**Figure 29-2. ADC Prescaler**

The propagation delay of an ADC measurement depends on the selected mode and is given by:

- Single-shot mode:

$$\text{PropagationDelay} = \frac{1 + \frac{\text{Resolution}}{2} + \text{DelayGain}}{f_{\text{CLK+ - ADC}}}$$

- Free-running mode:

$$\text{PropagationDelay} = \frac{\frac{\text{Resolution}}{2} + \text{DelayGain}}{f_{\text{CLK+ - ADC}}}$$

**Table 29-1. Delay Gain**

		Delay Gain (in CLK_ADC Period)			
		Free-running mode		Single shot mode	
Name	INTPUTCTRL.GAIN[3:0]	Differential Mode	Single-Ended Mode	Differential mode	Single-Ended mode
1X	0x0	0	0	0	1
2X	0x1	0	1	0.5	1.5
4X	0x2	1	1	1	2
8X	0x3	1	2	1.5	2.5
16X	0x4	2	2	2	3
Reserved	0x5 ... 0xE	Reserved	Reserved	Reserved	Reserved
DIV2	0xF	0	1	0.5	1.5

#### 29.6.4. ADC Resolution

The ADC supports 8-bit, 10-bit or 12-bit resolution. Resolution can be changed by writing the Resolution bit group in the Control B register (CTRLB.RESSEL). By default, the ADC resolution is set to 12 bits.

#### 29.6.5. Differential and Single-Ended Conversions

The ADC has two conversion options: differential and single-ended:

- If the positive input may go below the negative input, the **differential** mode should be used in order to get correct results.
- If the positive input is always positive, the **single-ended** conversion should be used in order to have full 12-bit resolution in the conversion.

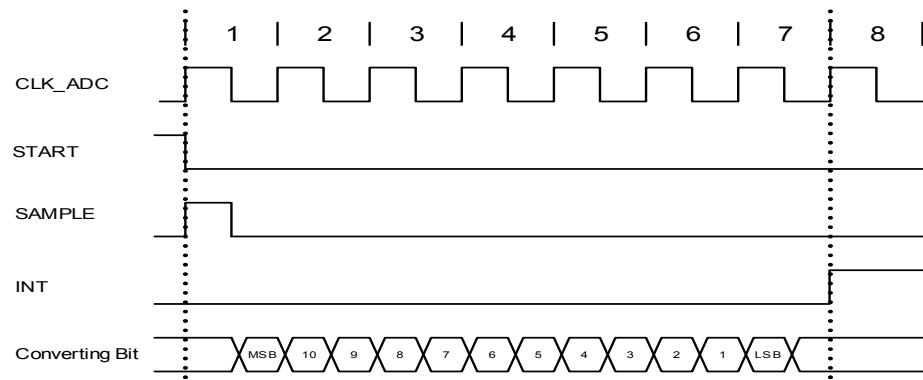

The negative input must be connected to ground. This ground could be the internal GND, IOGND or an external ground connected to a pin. Refer to the Control B (CTRLB) register for selection details.

If the positive input may go below the negative input, creating some negative results, the differential mode should be used in order to get correct results. The differential mode is enabled by setting DIFFMODE bit in the Control B register (CTRLB.DIFFMODE). Both conversion types could be run in single mode or in free-running mode. When the free-running mode is selected, an ADC input will continuously sample the input and performs a new conversion. The INTFLAG.RESRDY bit will be set at the end of each conversion.

##### 29.6.5.1. Conversion Timing

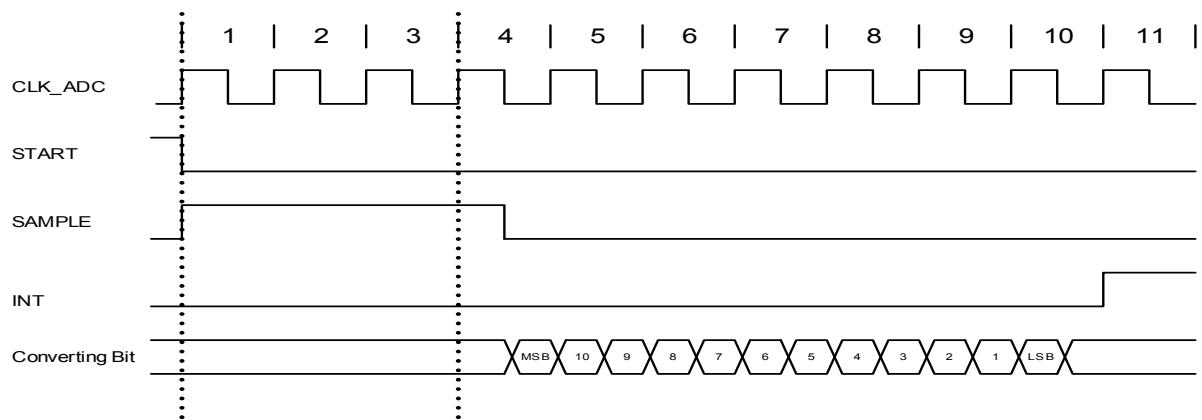

The following figure shows the ADC timing for one single conversion. A conversion starts after the software or event start are synchronized with the GCLK\_ADC clock. The input channel is sampled in the first half CLK\_ADC period.

**Figure 29-3. ADC Timing for One Conversion in Differential Mode without Gain**

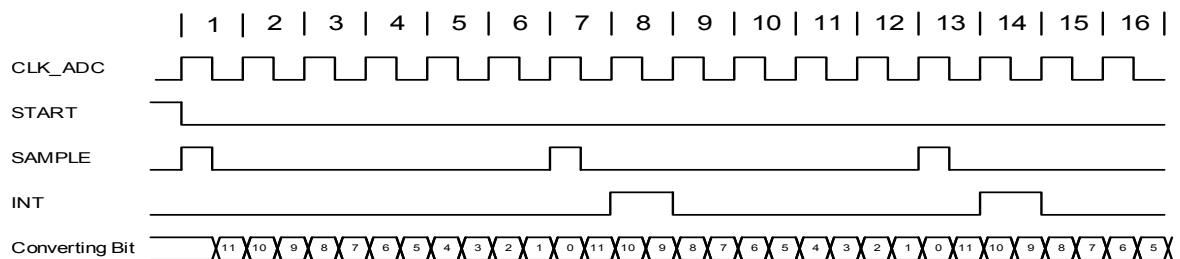

The sampling time can be increased by using the Sampling Time Length bit group in the Sampling Time Control register (SAMPCTRL.SAMPLEN). As example, the next figure is showing the timing conversion.

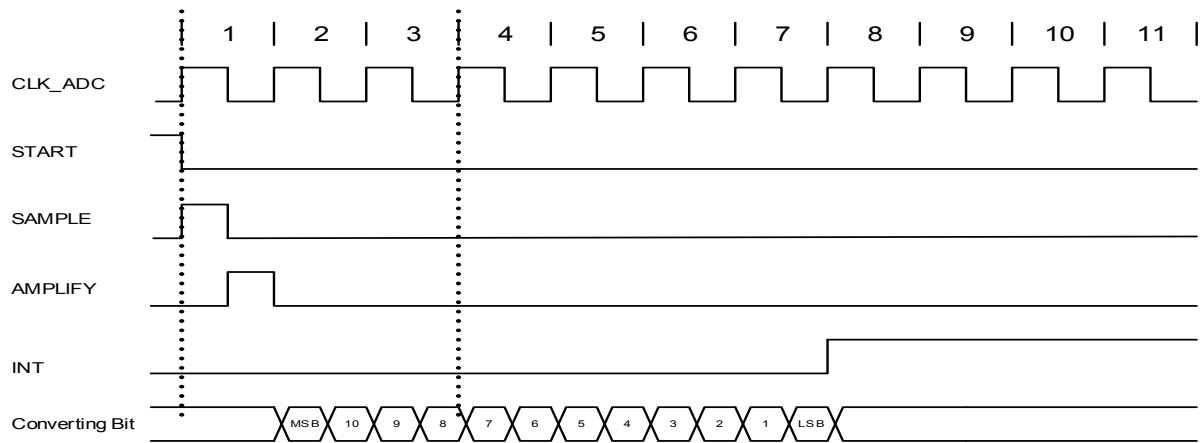

**Figure 29-4. ADC Timing for One Conversion in Differential Mode without Gain, but with Increased Sampling Time**

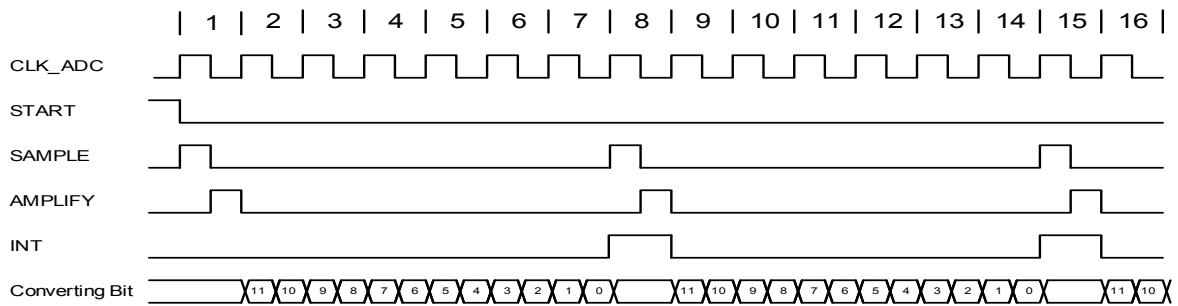

**Figure 29-5. ADC Timing for Free Running in Differential Mode without Gain**

**Figure 29-6. ADC Timing for One Conversion in Single-Ended Mode without Gain**

**Figure 29-7. ADC Timing for Free Running in Single-Ended Mode without Gain**

#### 29.6.6. Accumulation

The result from multiple consecutive conversions can be accumulated. The number of samples to be accumulated is specified by the Number of Samples to be Collected field in the Average Control register (AVGCTRL.SAMPLENUM). When accumulating more than 16 samples, the result will be too large to match the 16-bit RESULT register size. To avoid overflow, the result is right shifted automatically to fit within the available register size. The number of automatic right shifts is specified in the table below.

**Note:** To perform the accumulation of two or more samples, the Conversion Result Resolution field in the Control B register (CTRLB.RESSEL) must be set.

**Table 29-2. Accumulation**

Number of Accumulated Samples	AVGCTRL.SAMPLENUM	Intermediate Result Precision	Number of Automatic Right Shifts	Final Result Precision	Automatic Division Factor
1	0x0	12 bits	0	12 bits	0
2	0x1	13 bits	0	13 bits	0
4	0x2	14 bits	0	14 bits	0
8	0x3	15 bits	0	15 bits	0
16	0x4	16 bits	0	16 bits	0
32	0x5	17 bits	1	16 bits	2
64	0x6	18 bits	2	16 bits	4
128	0x7	19 bits	3	16 bits	8

Number of Accumulated Samples	AVGCTRL.SAMPLENUM	Intermediate Result Precision	Number of Automatic Right Shifts	Final Result Precision	Automatic Division Factor
256	0x8	20 bits	4	16 bits	16
512	0x9	21 bits	5	16 bits	32
1024	0xA	22 bits	6	16 bits	64
Reserved	0xB - 0xF	12 bits		12 bits	0

### 29.6.7. Averaging

Averaging is a feature that increases the sample accuracy, at the cost of a reduced sampling rate. This feature is suitable when operating in noisy conditions.

Averaging is done by accumulating m samples, as described in [Accumulation](#), and dividing the result by m. The averaged result is available in the RESULT register. The number of samples to be accumulated is specified by writing to AVGCTRL.SAMPLENUM.

The division is obtained by a combination of the automatic right shift described above, and an additional right shift that must be specified by writing to the Adjusting Result/Division Coefficient field in AVGCTRL (AVGCTRL.ADJRES).

**Note:** To perform the averaging of two or more samples, the Conversion Result Resolution field in the Control B register (CTRLB.RESSEL) must be set to '1'.

Averaging AVGCTRL.SAMPLENUM samples will reduce the un-averaged sampling rate by a factor  $\frac{1}{AVGCTRL.SAMPLENUM}$ .

When the averaged result is available, the INTFLAG.RESRDY bit will be set.

**Table 29-3. Averaging**

Number of Accumulated Samples	AVGCTRL.SAMPLENUM	Intermediate Result Precision	Number of Automatic Right Shifts	Division Factor	AVGCTRL.ADJRES	Total Number of Right Shifts	Final Result Precision	Automatic Division Factor
1	0x0	12 bits	0	1	0x0		12 bits	0
2	0x1	13	0	2	0x1	1	12 bits	0
4	0x2	14	0	4	0x2	2	12 bits	0
8	0x3	15	0	8	0x3	3	12 bits	0
16	0x4	16	0	16	0x4	4	12 bits	0
32	0x5	17	1	16	0x4	5	12 bits	2
64	0x6	18	2	16	0x4	6	12 bits	4
128	0x7	19	3	16	0x4	7	12 bits	8
256	0x8	20	4	16	0x4	8	12 bits	16
512	0x9	21	5	16	0x4	9	12 bits	32
1024	0xA	22	6	16	0x4	10	12 bits	64
Reserved	0xB-0xF				0x0		12 bits	0

### 29.6.8. Oversampling and Decimation

By using oversampling and decimation, the ADC resolution can be increased from 12 bits up to 16 bits, for the cost of reduced effective sampling rate.

To increase the resolution by n bits,  $4^n$  samples must be accumulated. The result must then be right-shifted by n bits. This right-shift is a combination of the automatic right-shift and the value written to AVGCTRL.ADJRES. To obtain the correct resolution, the ADJRES must be configured as described in the table below. This method will result in n bit extra LSB resolution.

**Table 29-4. Configuration Required for Oversampling and Decimation**

Result Resolution	Number of Samples to Average	AVGCTRL.SAMPLENUM[3:0]	Number of Automatic Right Shifts	AVGCTRL.ADJRES[2:0]
13 bits	$4^1 = 4$	0x2	0	0x1
14 bits	$4^2 = 16$	0x4	0	0x2
15 bits	$4^3 = 64$	0x6	2	0x1
16 bits	$4^4 = 256$	0x8	4	0x0

#### 29.6.9. Window Monitor

The window monitor feature allows the conversion result in the RESULT register to be compared to predefined threshold values. The window mode is selected by setting the Window Monitor Mode bits in the Window Monitor Control register (WINCTRL.WINMODE[2:0]). Threshold values must be written in the Window Monitor Lower Threshold register (WINLT) and Window Monitor Upper Threshold register (WINUT).

If differential input is selected, the WINLT and WINUT are evaluated as signed values. Otherwise they are evaluated as unsigned values. The significant WINLT and WINUT bits are given by the precision selected in the Conversion Result Resolution bit group in the Control B register (CTRLB.RESEL). This means that e.g. in 8-bit mode, only the eight lower bits will be considered. In addition, in differential mode, the eighth bit will be considered as the sign bit, even if the ninth bit is zero.

The INTFLAG.WINMON interrupt flag will be set if the conversion result matches the window monitor condition.

#### 29.6.10. Offset and Gain Correction

Inherent gain and offset errors affect the absolute accuracy of the ADC.

The offset error is defined as the deviation of the actual ADC transfer function from an ideal straight line at zero input voltage. The offset error cancellation is handled by the Offset Correction register (OFFSETCORR). The offset correction value is subtracted from the converted data before writing the Result register (RESULT).

The gain error is defined as the deviation of the last output step's midpoint from the ideal straight line, after compensating for offset error. The gain error cancellation is handled by the Gain Correction register (GAINCORR).

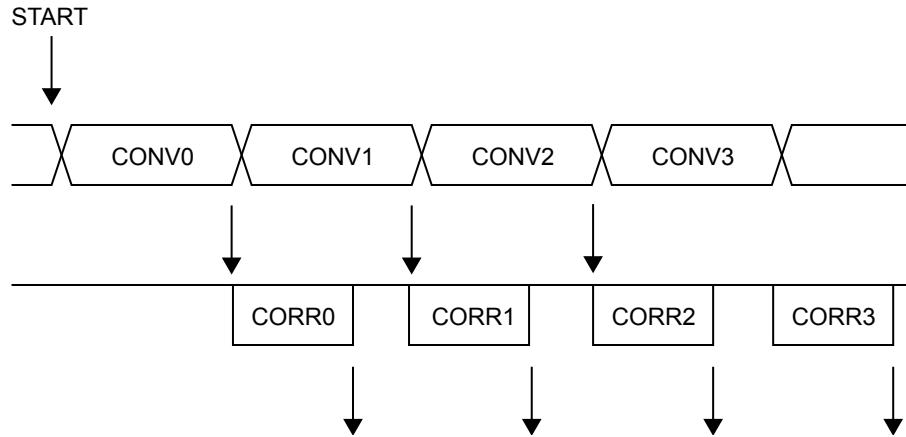

To correct these two errors, the Digital Correction Logic Enabled bit in the Control B register (CTRLB.CORREN) must be set to "1".

Offset and gain error compensation results are both calculated according to:

$$\text{Result} = (\text{Conversion value} + -\text{OFFSETCORR}) \cdot \text{GAINCORR}$$

The correction will introduce a latency of 13 CLK\_ADC clock cycles. In free running mode this latency is introduced on the first conversion only, since its duration is always less than the propagation delay. In single conversion mode this latency is introduced for each conversion.

**Figure 29-8. ADC Timing Correction Enabled**

#### 29.6.11. Interrupts

The ADC has the following interrupt sources:

- Result Conversion Ready: RESRDY
- Window Monitor: WINMON
- Overrun: OVERRUN

Each interrupt source has an interrupt flag associated with it. The interrupt flag in the Interrupt Flag Status and Clear (INTFLAG) register is set when the interrupt condition occurs. Each interrupt can be individually enabled by writing a one to the corresponding bit in the Interrupt Enable Set (INTENSET) register, and disabled by writing a one to the corresponding bit in the Interrupt Enable Clear (INTENCLR) register. An interrupt request is generated when the interrupt flag is set and the corresponding interrupt is enabled.

The interrupt request remains active until the interrupt flag is cleared, the interrupt is disabled, or the ADC is reset. An interrupt flag is cleared by writing a one to the corresponding bit in the INTFLAG register.

Each peripheral can have one interrupt request line per interrupt source or one common interrupt request line for all the interrupt sources. This is device dependent.

Refer to *Nested Vector Interrupt Controller* for details. The user must read the INTFLAG register to determine which interrupt condition is present.

[Nested Vector Interrupt Controller](#) on page 41

#### 29.6.12. Events

The ADC can generate the following output events:

- Result Ready (RESRDY): Generated when the conversion is complete and the result is available.
- Window Monitor (WINMON): Generated when the window monitor condition match.

Setting an Event Output bit in the Event Control Register (EVCTRL.xxEO=1) enables the corresponding output event. Clearing this bit disables the corresponding output event. Refer to the *Event System* chapter for details on configuring the event system.

The peripheral can take the following actions on an input event:

- Start conversion (START): Start a conversion.
- Conversion flush (FLUSH): Flush the conversion.

Setting an Event Input bit in the Event Control register (EVCTRL.xxEI=1) enables the corresponding action on input event. Clearing this bit disables the corresponding action on input event.

**Note:** If several events are connected to the ADC, the enabled action will be taken on any of the incoming events. The events must be correctly routed in the Event System.

[EVSYS – Event System](#) on page 349

### 29.6.13. Sleep Mode Operation

The Run in Standby bit in the Control A register (CTRLA.RUNSTDBY) controls the behavior of the ADC during standby sleep mode. When CTRLA.RUNSTDBY=0, the ADC is disabled during sleep, but maintains its current configuration. When CTRLA.RUNSTDBY=1, the ADC continues to operate during sleep. Note that when CTRLA.RUNSTDBY=0, the analog blocks are powered off for the lowest power consumption. This necessitates a start-up time delay when the system returns from sleep.

When CTRLA.RUNSTDBY=1, any enabled ADC interrupt source can wake up the CPU. While the CPU is sleeping, ADC conversion can only be triggered by events.

### 29.6.14. Synchronization

Due to asynchronicity between the main clock domain and the peripheral clock domains, some registers need to be synchronized when written or read.

When executing an operation that requires synchronization, the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY) will be set immediately, and cleared when synchronization is complete. The Synchronization Ready interrupt can be used to signal when synchronization is complete.

If an operation that requires synchronization is executed while STATUS.SYNCBUSY=1, the bus will be stalled. All operations will complete successfully, but the CPU will be stalled and interrupts will be pending as long as the bus is stalled.

The following bits are synchronized when written:

- Software Reset bit in the Control A register (CTRLA.SWRST)
- Enable bit in the Control A register (CTRLA.ENABLE)

The following registers are synchronized when written:

- Control B (CTRLB)
- Software Trigger (SWTRIG)
- Window Monitor Control (WINCTRL)
- Input Control (INPUTCTRL)
- Window Upper/Lower Threshold (WINUT/WINLT)

Required write-synchronization is denoted by the "Write-Synchronized" property in the register description.

The following registers are synchronized when read:

- Software Trigger (SWTRIG)
- Input Control (INPUTCTRL)

Required read-synchronization is denoted by the "Read-Synchronized" property in the register description.

## 29.8. Register Description

Registers can be 8, 16 or 32 bits wide. Atomic 8-, 16- and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers are optionally write-protected by the Peripheral Access Controller (PAC). Write-protection is denoted by the Write-Protected property in each individual register description.

Some registers require synchronization when read and/or written. Synchronization is denoted by the Write-Synchronized or the Read-Synchronized property in each individual register description.

Some registers are enable-protected, meaning they can be written only when the ADC is disabled. Enable-protection is denoted by the Enable-Protected property in each individual register description.

### 29.8.1. Control A

**Name:** CTRLA  
**Offset:** 0x00  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
Access						RUNSTDBY	ENABLE	SWRST
Reset						0	0	0

#### Bit 2 – RUNSTDBY: Run in Standby

This bit indicates whether the ADC will continue running in standby sleep mode or not:

Value	Description
0	The ADC is halted during standby sleep mode.
1	The ADC continues normal operation during standby sleep mode.

#### Bit 1 – ENABLE: Enable

Due to synchronization, there is a delay from writing CTRLA.ENABLE until the peripheral is enabled/disabled. The value written to CTRL.ENABLE will read back immediately and the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY) will be set. STATUS.SYNCBUSY will be cleared when the operation is complete.

Value	Description
0	The ADC is disabled.
1	The ADC is enabled.

#### Bit 0 – SWRST: Software Reset

Writing a zero to this bit has no effect.

Writing a one to this bit resets all registers in the ADC, except DBGCTRL, to their initial state, and the ADC will be disabled.

Writing a one to CTRL.SWRST will always take precedence, meaning that all other writes in the same write-operation will be discarded.

Due to synchronization, there is a delay from writing CTRLA.SWRST until the reset is complete. CTRLA.SWRST and STATUS.SYNCBUSY will both be cleared when the reset is complete.

Value	Description
0	There is no reset operation ongoing.
1	The reset operation is ongoing.

## 29.8.2. Reference Control

**Name:** REFCTRL  
**Offset:** 0x01  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0					
	REFCOMP					REFSEL[3:0]							
Access	R/W				R/W	R/W	R/W	R/W					
Reset	0				0	0	0	0					

### Bit 7 – REFCOMP: Reference Buffer Offset Compensation Enable

The accuracy of the gain stage can be increased by enabling the reference buffer offset compensation. This will decrease the input impedance and thus increase the start-up time of the reference.

Value	Description
0	Reference buffer offset compensation is disabled.
1	Reference buffer offset compensation is enabled.

### Bits 3:0 – REFSEL[3:0]: Reference Selection

These bits select the reference for the ADC.

Table 29-5. Reference Selection

REFSEL[3:0]	Name	Description
0x0	INT1V	1.0V voltage reference
0x1	INTVCC0	1/1.48 VDDANA
0x2	INTVCC1	1/2 VDDANA (only for VDDANA > 2.0V)
0x3	VREFA	External reference
0x4	VREFB	External reference
0x5-0xF		Reserved

### 29.8.3. Average Control

**Name:** AVGCTRL  
**Offset:** 0x02  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
	ADJRES[2:0]					SAMPLENUM[3:0]		
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 6:4 – ADJRES[2:0]: Adjusting Result / Division Coefficient

These bits define the division coefficient in  $2^n$  steps.

#### Bits 3:0 – SAMPLENUM[3:0]: Number of Samples to be Collected

These bits define how many samples should be added together. The result will be available in the Result register (RESULT). Note: if the result width increases, CTRLB.RESSEL must be changed.

SAMPLENUM[3:0]	Name	Description
0x0	1	1 sample
0x1	2	2 samples
0x2	4	4 samples
0x3	8	8 samples
0x4	16	16 samples
0x5	32	32 samples
0x6	64	64 samples
0x7	128	128 samples
0x8	256	256 samples
0x9	512	512 samples
0xA	1024	1024 samples
0xB-0xF		Reserved

#### 29.8.4. Sampling Time Control

**Name:** SAMPCTRL  
**Offset:** 0x03  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
	SAMPLEN[5:0]							
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

#### Bits 5:0 – SAMPLEN[5:0]: Sampling Time Length

These bits control the ADC sampling time in number of half CLK\_ADC cycles, depending of the prescaler value, thus controlling the ADC input impedance. Sampling time is set according to the equation:

$$\text{Sampling time} = (\text{SAMPLEN}+1) \cdot \left( \frac{\text{CLK}_{\text{ADC}}}{2} \right)$$

### 29.8.5. Control B

**Name:** CTRLB

**Offset:** 0x04

**Reset:** 0x0000

**Property:** Write-Protected, Write-Synchronized

Bit	15	14	13	12	11	10	9	8
Access	PRESCALER[2:0]							
Reset	0 0 0							
Bit	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 10:8 – PRESCALER[2:0]: Prescaler Configuration

These bits define the ADC clock relative to the peripheral clock.

PRESCALER[2:0]	Name	Description
0x0	DIV4	Peripheral clock divided by 4
0x1	DIV8	Peripheral clock divided by 8
0x2	DIV16	Peripheral clock divided by 16
0x3	DIV32	Peripheral clock divided by 32
0x4	DIV64	Peripheral clock divided by 64
0x5	DIV128	Peripheral clock divided by 128
0x6	DIV256	Peripheral clock divided by 256
0x7	DIV512	Peripheral clock divided by 512

#### Bits 5:4 – RESSEL[1:0]: Conversion Result Resolution

These bits define whether the ADC completes the conversion at 12-, 10- or 8-bit result resolution.

RESSEL[1:0]	Name	Description
0x0	12BIT	12-bit result
0x1	16BIT	For averaging mode output
0x2	10BIT	10-bit result
0x3	8BIT	8-bit result

#### Bit 3 – CORREN: Digital Correction Logic Enabled

Value	Description
0	Disable the digital result correction.
1	Enable the digital result correction. The ADC conversion result in the RESULT register is then corrected for gain and offset based on the values in the GAINCAL and OFFSETCAL registers. Conversion time will be increased by X cycles according to the value in the Offset Correction Value bit group in the Offset Correction register.

#### Bit 2 – FREERUN: Free Running Mode

Value	Description
0	The ADC run is single conversion mode.
1	The ADC is in free running mode and a new conversion will be initiated when a previous conversion completes.

#### Bit 1 – LEFTADJ: Left-Adjusted Result

Value	Description
0	The ADC conversion result is right-adjusted in the RESULT register.
1	The ADC conversion result is left-adjusted in the RESULT register. The high byte of the 12-bit result will be present in the upper part of the result register. Writing this bit to zero (default) will right-adjust the value in the RESULT register.

#### Bit 0 – DIFFMODE: Differential Mode

Value	Description
0	The ADC is running in singled-ended mode.
1	The ADC is running in differential mode. In this mode, the voltage difference between the MUXPOS and MUXNEG inputs will be converted by the ADC.

## 29.8.6. Window Monitor Control

**Name:** WINCTRL

**Offset:** 0x08

**Reset:** 0x00

**Property:** Write-Protected, Write-Synchronized

Bit	7	6	5	4	3	2	1	0
	WINMODE[2:0]							
Access						R/W	R/W	R/W
Reset						0	0	0

### Bits 2:0 – WINMODE[2:0]: Window Monitor Mode

These bits enable and define the window monitor mode.

WINMODE[2:0]	Name	Description
0x0	DISABLE	No window mode (default)
0x1	MODE1	Mode 1: RESULT > WINLT
0x2	MODE2	Mode 2: RESULT < WINUT
0x3	MODE3	Mode 3: WINLT < RESULT < WINUT
0x4	MODE4	Mode 4: !(WINLT < RESULT < WINUT)
0x5-0x7		Reserved

### 29.8.7. Software Trigger

**Name:** SWTRIG

**Offset:** 0x0C

**Reset:** 0x00

**Property:** Write-Protected, Write-Synchronized

Bit	7	6	5	4	3	2	1	0
Access							START	FLUSH
Reset							R/W	R/W
							0	0

#### Bit 1 – START: ADC Start Conversion

Writing this bit to zero will have no effect.

Value	Description
0	The ADC will not start a conversion.
1	The ADC will start a conversion. The bit is cleared by hardware when the conversion has started. Setting this bit when it is already set has no effect.

#### Bit 0 – FLUSH: ADC Conversion Flush

After the flush, the ADC will resume where it left off; i.e., if a conversion was pending, the ADC will start a new conversion.

Writing this bit to zero will have no effect.

Value	Description
0	No flush action.
1	"Writing a '1' to this bit will flush the ADC pipeline. A flush will restart the ADC clock on the next peripheral clock edge, and all conversions in progress will be aborted and lost. This bit will be cleared after the ADC has been flushed.  After the flush, the ADC will resume where it left off; i.e., if a conversion was pending, the ADC will start a new conversion."

## 29.8.8. Input Control

**Name:** INPUTCTRL

**Offset:** 0x10

**Reset:** 0x00000000

**Property:** Write-Protected, Write-Synchronized

Bit	31	30	29	28	27	26	25	24
	GAIN[3:0]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	23	22	21	20	19	18	17	16
	INPUTOFFSET[3:0]				INPUTSCAN[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	MUXNEG[4:0]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MUXPOS[4:0]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

### Bits 27:24 – GAIN[3:0]: Gain Factor Selection

These bits set the gain factor of the ADC gain stage.

GAIN[3:0]	Name	Description
0x0	1X	1x
0x1	2X	2x
0x2	4X	4x
0x3	8X	8x
0x4	16X	16x
0x5-0xE	-	Reserved
0xF	DIV2	1/2x

### Bits 23:20 – INPUTOFFSET[3:0]: Positive Mux Setting Offset

The pin scan is enabled when INPUTSCAN != 0. Writing these bits to a value other than zero causes the first conversion triggered to be converted using a positive input equal to MUXPOS + INPUTOFFSET. Setting this register to zero causes the first conversion to use a positive input equal to MUXPOS.

After a conversion, the INPUTOFFSET register will be incremented by one, causing the next conversion to be done with the positive input equal to MUXPOS + INPUTOFFSET. The sum of MUXPOS and INPUTOFFSET gives the input that is actually converted.

**Bits 19:16 – INPUTSCAN[3:0]: Number of Input Channels Included in Scan**

This register gives the number of input sources included in the pin scan. The number of input sources included is INPUTSCAN + 1. The input channels included are in the range from MUXPOS + INPUTOFFSET to MUXPOS + INPUTOFFSET + INPUTSCAN.

The range of the scan mode must not exceed the number of input channels available on the device.

**Bits 12:8 – MUXNEG[4:0]: Negative Mux Input Selection**

These bits define the Mux selection for the negative ADC input selections.

Value	Name	Description
0x00	PIN0	ADC AIN0 pin
0x01	PIN1	ADC AIN1 pin
0x02	PIN2	ADC AIN2 pin
0x03	PIN3	ADC AIN3 pin
0x04	PIN4	ADC AIN4 pin
0x05	PIN5	ADC AIN5 pin
0x06	PIN6	ADC AIN6 pin
0x07	PIN7	ADC AIN7 pin
0x08-0x17	-	Reserved
0x18	GND	Internal ground
0x19	IOGND	I/O ground
0x1A-0x1F	-	Reserved

**Bits 4:0 – MUXPOS[4:0]: Positive Mux Input Selection**

These bits define the Mux selection for the positive ADC input. The following table shows the possible input selections. If the internal bandgap voltage or temperature sensor input channel is selected, then the Sampling Time Length bit group in the SamplingControl register must be written.

MUXPOS[4:0]	Group configuration	Description
0x00	PIN0	ADC AIN0 pin
0x01	PIN1	ADC AIN1 pin
0x02	PIN2	ADC AIN2 pin
0x03	PIN3	ADC AIN3 pin
0x04	PIN4	ADC AIN4 pin
0x05	PIN5	ADC AIN5 pin
0x06	PIN6	ADC AIN6 pin
0x07	PIN7	ADC AIN7 pin
0x08	PIN8	ADC AIN8 pin

<b>MUXPOS[4:0]</b>	<b>Group configuration</b>	<b>Description</b>
0x09	PIN9	ADC AIN9 pin
0x0A	PIN10	ADC AIN10 pin
0x0B	PIN11	ADC AIN11 pin
0x0C	PIN12	ADC AIN12 pin
0x0D	PIN13	ADC AIN13 pin
0x0E	PIN14	ADC AIN14 pin
0x0F	PIN15	ADC AIN15 pin
0x10	PIN16	ADC AIN16 pin
0x11	PIN17	ADC AIN17 pin
0x12	PIN18	ADC AIN18 pin
0x13	PIN19	ADC AIN19 pin
0x14-0x17		Reserved
0x18	TEMP	Temperature reference
0x19	BANDGAP	Bandgap voltage
0x1A	SCALEDCOREVCC	1/4 scaled core supply
0x1B	SCALEDIOVCC	1/4 scaled I/O supply
0x1C	DAC	DAC output
0x1D-0x1F		Reserved

### 29.8.9. Event Control

**Name:** EVCTRL  
**Offset:** 0x14  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
			WINMONEO	RESRDYEO			SYNCEI	STARTEI
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

#### Bit 5 – WINMONEO: Window Monitor Event Out

This bit indicates whether the Window Monitor event output is enabled or not and an output event will be generated when the window monitor detects something.

Value	Description
0	Window Monitor event output is disabled and an event will not be generated.
1	Window Monitor event output is enabled and an event will be generated.

#### Bit 4 – RESRDYEO: Result Ready Event Out

This bit indicates whether the Result Ready event output is enabled or not and an output event will be generated when the conversion result is available.

Value	Description
0	Result Ready event output is disabled and an event will not be generated.
1	Result Ready event output is enabled and an event will be generated.

#### Bit 1 – SYNCEI: Synchronization Event In

Value	Description
0	A flush and new conversion will not be triggered on any incoming event.
1	A flush and new conversion will be triggered on any incoming event.

#### Bit 0 – STARTEI: Start Conversion Event In

Value	Description
0	A new conversion will not be triggered on any incoming event.
1	A new conversion will be triggered on any incoming event.

### 29.8.10. Interrupt Enable Clear

**Name:** INTENCLR  
**Offset:** 0x16  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
					SYNCRDY	WINMON	OVERRUN	RESRDY
Access					R/W	R/W	R/W	R/W

Reset

0	0	0	0
---	---	---	---

#### Bit 3 – SYNCRDY: Synchronization Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Synchronization Ready Interrupt Enable bit and the corresponding interrupt request.

Value	Description
0	The Synchronization Ready interrupt is disabled.
1	The Synchronization Ready interrupt is enabled, and an interrupt request will be generated when the Synchronization Ready interrupt flag is set.

#### Bit 2 – WINMON: Window Monitor Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Window Monitor Interrupt Enable bit and the corresponding interrupt request.

Value	Description
0	The window monitor interrupt is disabled.
1	The window monitor interrupt is enabled, and an interrupt request will be generated when the Window Monitor interrupt flag is set.

#### Bit 1 – OVERRUN: Overrun Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Overrun Interrupt Enable bit and the corresponding interrupt request.

Value	Description
0	The Overrun interrupt is disabled.
1	The Overrun interrupt is enabled, and an interrupt request will be generated when the Overrun interrupt flag is set.

#### Bit 0 – RESRDY: Result Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will clear the Result Ready Interrupt Enable bit and the corresponding interrupt request.

Value	Description
0	The Result Ready interrupt is disabled.
1	The Result Ready interrupt is enabled, and an interrupt request will be generated when the Result Ready interrupt flag is set.

### 29.8.11. Interrupt Enable Set

**Name:** INTENSET  
**Offset:** 0x17  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0
Access					SYNCRDY	WINMON	OVERRUN	RESRDY
Reset					0	0	0	0

#### Bit 3 – SYNCRDY: Synchronization Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the Synchronization Ready Interrupt Enable bit, which enables the Synchronization Ready interrupt.

Value	Description
0	The Synchronization Ready interrupt is disabled.
1	The Synchronization Ready interrupt is enabled.

#### Bit 2 – WINMON: Window Monitor Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the Window Monitor Interrupt bit and enable the Window Monitor interrupt.

Value	Description
0	The Window Monitor interrupt is disabled.
1	The Window Monitor interrupt is enabled.

#### Bit 1 – OVERRUN: Overrun Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the Overrun Interrupt bit and enable the Overrun interrupt.

Value	Description
0	The Overrun interrupt is disabled.
1	The Overrun interrupt is enabled.

#### Bit 0 – RESRDY: Result Ready Interrupt Enable

Writing a zero to this bit has no effect.

Writing a one to this bit will set the Result Ready Interrupt bit and enable the Result Ready interrupt.

Value	Description
0	The Result Ready interrupt is disabled.
1	The Result Ready interrupt is enabled.

## 29.8.12. Interrupt Flag Status and Clear

**Name:** INTFLAG

**Offset:** 0x18

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0
					SYNCRDY	WINMON	OVERRUN	RESRDY
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

### Bit 3 – SYNCRDY: Synchronization Ready

This flag is cleared by writing a one to the flag.

This flag is set on a one-to-zero transition of the Synchronization Busy bit in the Status register (STATUS.SYNCBUSY), except when caused by an enable or software reset, and will generate an interrupt request if INTENCLR/SET.SYNCRDY is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Synchronization Ready interrupt flag.

### Bit 2 – WINMON: Window Monitor

This flag is cleared by writing a one to the flag or by reading the RESULT register.

This flag is set on the next GCLK\_ADC cycle after a match with the window monitor condition, and an interrupt request will be generated if INTENCLR/SET.WINMON is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Window Monitor interrupt flag.

### Bit 1 – OVERRUN: Overrun

This flag is cleared by writing a one to the flag.

This flag is set if RESULT is written before the previous value has been read by CPU, and an interrupt request will be generated if INTENCLR/SET.OVERRUN is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Overrun interrupt flag.

### Bit 0 – RESRDY: Result Ready

This flag is cleared by writing a one to the flag or by reading the RESULT register.

This flag is set when the conversion result is available, and an interrupt will be generated if INTENCLR/SET.RESRDY is one.

Writing a zero to this bit has no effect.

Writing a one to this bit clears the Result Ready interrupt flag.

### 29.8.13. Status

**Name:** STATUS

**Offset:** 0x19

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0
	SYNCBUSY							
Access	R							
Reset	0							

#### **Bit 7 – SYNCBUSY: Synchronization Busy**

This bit is cleared when the synchronization of registers between the clock domains is complete.

This bit is set when the synchronization of registers between clock domains is started.

#### 29.8.14. Result

**Name:** RESULT  
**Offset:** 0x1A  
**Reset:** 0x0000  
**Property:** Read-Synchronized

Bit	15	14	13	12	11	10	9	8
RESULT[15:8]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
RESULT[7:0]								
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – RESULT[15:0]: Result Conversion Value

These bits will hold up to a 16-bit ADC result, depending on the configuration.

In single conversion mode without averaging, the ADC conversion will produce a 12-bit result, which can be left- or right-shifted, depending on the setting of CTRLB.LEFTADJ.

If the result is left-adjusted (CTRLB.LEFTADJ), the high byte of the result will be in bit position [15:8], while the remaining 4 bits of the result will be placed in bit locations [7:4]. This can be used only if an 8-bit result is required; i.e., one can read only the high byte of the entire 16-bit register.

If the result is not left-adjusted (CTRLB.LEFTADJ) and no oversampling is used, the result will be available in bit locations [11:0], and the result is then 12 bits long.

If oversampling is used, the result will be located in bit locations [15:0], depending on the settings of the Average Control register (AVGCTRL).

### 29.8.15. Window Monitor Lower Threshold

**Name:** WINLT

**Offset:** 0x1C

**Reset:** 0x0000

**Property:** Write-Protected, Write-Synchronized

Bit	15	14	13	12	11	10	9	8
WINLT[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
WINLT[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – WINLT[15:0]: Window Lower Threshold

If the window monitor is enabled, these bits define the lower threshold value.

### 29.8.16. Window Monitor Upper Threshold

**Name:** WINUT

**Offset:** 0x20

**Reset:** 0x0000

**Property:** Write-Protected, Write-Synchronized

Bit	15	14	13	12	11	10	9	8
WINUT[15:8]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
WINUT[7:0]								
Access	R/W							
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – WINUT[15:0]: Window Upper Threshold

If the window monitor is enabled, these bits define the upper threshold value.

### 29.8.17. Gain Correction

**Name:** GAINCORR  
**Offset:** 0x24  
**Reset:** 0x0000  
**Property:** Write-Protected

Bit	15	14	13	12	11	10	9	8
	GAINCORR[11:8]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	GAINCORR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 11:0 – GAINCORR[11:0]: Gain Correction Value

If the CTRLB.CORREN bit is one, these bits define how the ADC conversion result is compensated for gain error before being written to the result register. The gain-correction is a fractional value, a 1-bit integer plus an 11-bit fraction, and therefore  $1/2 \leq \text{GAINCORR} < 2$ . GAINCORR values range from 0.10000000000 to 1.1111111111.

### 29.8.18. Offset Correction

**Name:** OFFSETCORR

**Offset:** 0x26

**Reset:** 0x0000

**Property:** Write-Protected

Bit	15	14	13	12	11	10	9	8
	OFFSETCORR[11:8]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	OFFSETCORR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 11:0 – OFFSETCORR[11:0]: Offset Correction Value

If the CTRLB.CORREN bit is one, these bits define how the ADC conversion result is compensated for offset error before being written to the Result register. This OFFSETCORR value is in two's complement format.

### 29.8.19. Calibration

**Name:** CALIB  
**Offset:** 0x28  
**Reset:** 0x0000  
**Property:** Write-Protected

Bit	15	14	13	12	11	10	9	8
	BIAS_CAL[2:0]							
Access						R/W	R/W	R/W
Reset						0	0	0
Bit	7	6	5	4	3	2	1	0
	LINEARITY_CAL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 10:8 – BIAS\_CAL[2:0]: Bias Calibration Value

This value from production test must be loaded from the NVM software calibration area into the CALIB register by software to achieve the specified accuracy.

The value must be copied only, and must not be changed.

#### Bits 7:0 – LINEARITY\_CAL[7:0]: Linearity Calibration Value

This value from production test must be loaded from the NVM software calibration area into the CALIB register by software to achieve the specified accuracy.

The value must be copied only, and must not be changed.

### 29.8.20. Debug Control

**Name:** DBGCTRL  
**Offset:** 0x2A  
**Reset:** 0x00  
**Property:** Write-Protected

Bit	7	6	5	4	3	2	1	0	
Access									R/W
Reset									0

#### Bit 0 – DBGRUN: Debug Run

This bit can be changed only while the ADC is disabled.

This bit should be written only while a conversion is not ongoing.

Value	Description
0	The ADC is halted during debug mode.
1	The ADC continues normal operation during debug mode.

## 30. AC – Analog Comparators

### 30.1. Overview

The Analog Comparator (AC) supports individual comparators. Each comparator (COMP) compares the voltage levels on two inputs, and provides a digital output based on this comparison. Each comparator may be configured to generate interrupt requests and/or peripheral events upon several different combinations of input change.

Hysteresis and propagation delay are two important properties of the comparators' dynamic behavior. Both parameters may be adjusted to achieve the optimal operation for each application.

The input selection includes four shared analog port pins and several internal signals. Each comparator output state can also be output on a pin for use by external devices.

The comparators are always grouped in pairs on each port. The AC peripheral implements one of comparators. These are called Comparator 0 (COMP0) and Comparator 1 (COMP1). They have identical behaviors, but separate control registers. pair can be set in window mode to compare a signal to a voltage range instead of a single voltage level.

### 30.2. Features

- individual comparators
- Selectable propagation delay versus current consumption
- Selectable hysteresis
  - or Off
- Analog comparator outputs available on pins
  - Asynchronous or synchronous
- Flexible input selection:
  - Four pins selectable for positive or negative inputs
  - Ground (for zero crossing)
  - Bandgap reference voltage
  - 64-level programmable VDD scaler per comparator
  - DAC
- Interrupt generation on:
  - Rising or falling edge
  - Toggle
  - End of comparison
- Window function interrupt generation on:
  - Signal above window
  - Signal inside window
  - Signal below window
  - Signal outside window
- Event generation on:
  - Comparator output
  - Window function inside/outside window

- Optional digital filter on comparator output
- Low-power option
  - Single-shot support

### 30.3. Block Diagram

### 30.4. Signal Description

Signal	Description	Type
AIN[..0]	Analog input	Comparator inputs
CMP[..0]	Digital output	Comparator outputs

Refer to *I/O Multiplexing and Considerations* for details on the pin mapping for this peripheral. One signal can be mapped on several pins.

### 30.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly, as described below.

#### 30.5.1. I/O Lines

Using the AC's I/O lines requires the I/O pins to be configured. Refer to *PORT - I/O Pin Controller* for details.

##### Related Links

[PORT - I/O Pin Controller](#) on page 320

#### 30.5.2. Power Management

The AC will continue to operate in any sleep mode where the selected source clock is running. The AC's interrupts can be used to wake up the device from sleep modes. Events connected to the event system can trigger other operations in the system without exiting sleep modes.

##### Related Links

[PM – Power Manager](#) on page 129

#### 30.5.3. Clocks

The AC bus clock (CLK\_AC\_APB) can be enabled and disabled in the Power Manager, and the default state of CLK\_AC\_APB can be found in the Peripheral Clock Masking section in the Power Manager description.

Two generic clocks (GCLK\_AC\_DIG and GCLK\_AC\_ANA) are used by the AC. The digital clock (GCLK\_AC\_DIG) is required to provide the sampling rate for the comparators, while the analog clock (GCLK\_AC\_ANA) is required for low voltage operation ( $VDDANA < 2.5V$ ) to ensure that the resistance of the analog input multiplexors remains low. These clocks must be configured and enabled in the Generic Clock Controller before using the peripheral.

This generic clock is asynchronous to the bus clock (CLK\_AC\_APB). Due to this asynchronicity, writes to certain registers will require synchronization between the clock domains. Refer to [Synchronization](#) for further details.

##### Related Links

[PM – Power Manager](#) on page 129

#### 30.5.4. DMA

Not applicable.

#### 30.5.5. Interrupts

The interrupt request lines are connected to the interrupt controller. Using the AC interrupts requires the interrupt controller to be configured first. Refer to *Nested Vector Interrupt Controller* for details.

##### Related Links

[Nested Vector Interrupt Controller](#) on page 41

#### 30.5.6. Events

The events are connected to the Event System. Refer to *EVSYS – Event System* for details on how to configure the Event System.

##### Related Links

[EVSYS – Event System](#) on page 349

#### 30.5.7. Debug Operation

When the CPU is halted in debug mode, this peripheral will continue normal operation. If the peripheral is configured to require periodical service by the CPU through interrupts or similar, improper operation or data loss may result during debugging. This peripheral can be forced to halt operation during debugging.

#### 30.5.8. Register Access Protection

All registers with write-access can be write-protected optionally by the Peripheral Access Controller (PAC), except the following registers:

- Control B register (CTRLB)
- Interrupt Flag register (INTFLAG)

Optional write-protection by the Peripheral Access Controller (PAC) is denoted by the "PAC Write-Protection" property in each individual register description.

PAC write-protection does not apply to accesses through an external debugger.

##### Related Links

[PAC - Peripheral Access Controller](#) on page 45

#### 30.5.9. Analog Connections

Each comparator has up to four I/O pins that can be used as analog inputs. Each pair of comparators shares the same four pins. These pins must be configured for analog operation before using them as comparator inputs.

Any internal reference source, such as a bandgap voltage reference, or DAC must be configured and enabled prior to its use as a comparator input.

### 30.6. Functional Description

#### 30.6.1. Principle of Operation

Each comparator has one positive input and one negative input. Each positive input may be chosen from a selection of analog input pins. Each negative input may be chosen from a selection of both analog input pins and internal inputs, such as a bandgap voltage reference.

The digital output from the comparator is '1' when the difference between the positive and the negative input voltage is positive, and '0' otherwise.

The individual comparators can be used independently (normal mode) or paired to form a window comparison (window mode).

### 30.6.2. Basic Operation

#### 30.6.2.1. Initialization

Before enabling the AC, the input and output events must be configured in the Event Control register (EVCTRL). These settings cannot be changed while the AC is enabled.

#### 30.6.2.2. Enabling, Disabling and Resetting

The AC is enabled by writing a '1' to the Enable bit in the Control A register (CTRLA.ENABLE). The AC is disabled writing a '0' to CTRLA.ENABLE.

The AC is reset by writing a '1' to the Software Reset bit in the Control A register (CTRLA.SWRST). All registers in the AC will be reset to their initial state, and the AC will be disabled. Refer to *CTRLA* for details.

The individual comparators must be also enabled by writing a '1' to the Enable bit in the Comparator x Control registers (COMPCTRLx.ENABLE). However, when the AC is disabled, this will also disable the individual comparators, but will not clear their COMPCTRLx.ENABLE bits.

#### Related Links

[CTRLA](#) on page 571

#### 30.6.2.3. Comparator Configuration

Each individual comparator must be configured by its respective Comparator Control register (COMPCTRLx) before that comparator is enabled. These settings cannot be changed while the comparator is enabled.

- Select the desired measurement mode with COMPCTRLx.SINGLE. See [Starting a Comparison](#) for more details.
- Select the desired hysteresis with COMPCTRLx.HYSTEN. See [Input Hysteresis](#) for more details.
- Select the comparator speed versus power with COMPCTRLx.SPEED. See [Propagation Delay vs. Power Consumption](#) for more details.
- Select the interrupt source with COMPCTRLx.INTSEL.
- Select the positive and negative input sources with the COMPCTRLx.MUXPOS and COMPCTRLx.MUXNEG bits. See [Selecting Comparator Inputs](#) for more details.
- Select the filtering option with COMPCTRLx.FLEN.
- Select standby operation with Run in Standby bit (COMPCTRLx.RUNSTDBY).

The individual comparators are enabled by writing a '1' to the Enable bit in the Comparator x Control registers (COMPCTRLx.ENABLE). The individual comparators are disabled by writing a '0' to COMPCTRLx.ENABLE. Writing a '0' to CTRLA.ENABLE will also disable all the comparators, but will not clear their COMPCTRLx.ENABLE bits.

#### 30.6.2.4. Starting a Comparison

Each comparator channel can be in one of two different measurement modes, determined by the Single bit in the Comparator x Control register (COMPCTRLx.SINGLE):

- Continuous measurement
- Single-shot

After being enabled, a start-up delay is required before the result of the comparison is ready. This start-up time is measured automatically to account for environmental changes, such as temperature or voltage supply level, and is specified in *Electrical Characteristics*. During the start-up time, the COMP output is not available.

The comparator can be configured to generate interrupts when the output toggles, when the output changes from '0' to '1' (rising edge), when the output changes from '1' to '0' (falling edge) or at the end of the comparison. An end-of-comparison interrupt can be used with the single-shot mode to chain further events in the system, regardless of the state of the comparator outputs. The interrupt mode is set by the Interrupt Selection bit group in the Comparator Control register (COMPCTRLx.INTSEL). Events are generated using the comparator output state, regardless of whether the interrupt is enabled or not.

## Related Links

[Electrical Characteristics](#) on page 606

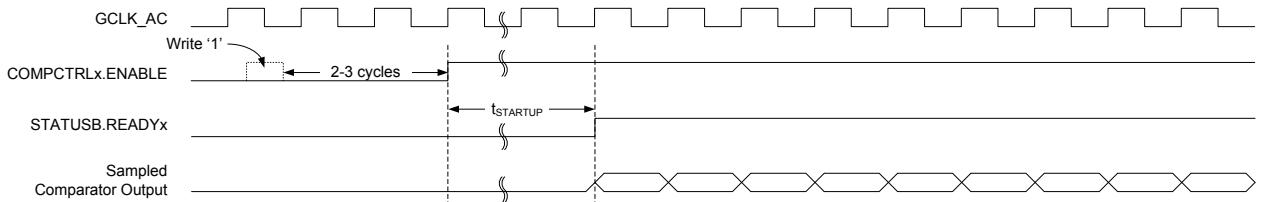

### Continuous Measurement

Continuous measurement is selected by writing COMPCTRLx.SINGLE to zero. In continuous mode, the comparator is continuously enabled and performing comparisons. This ensures that the result of the latest comparison is always available in the Current State bit in the Status A register (STATUSA.STATE<sub>x</sub>).

After the start-up time has passed, a comparison is done and STATUSA is updated. The Comparator x Ready bit in the Status B register (STATUSB.READY<sub>x</sub>) is set, and the appropriate peripheral events and interrupts are also generated. New comparisons are performed continuously until the COMPCTRLx.ENABLE bit is written to zero. The start-up time applies only to the first comparison.

In continuous operation, edge detection of the comparator output for interrupts is done by comparing the current and previous sample. The sampling rate is the CLK\_AC\_DIG frequency. An example of continuous measurement is shown in the next figure.

**Figure 30-1. Continuous Measurement Example**

For low-power operation, comparisons can be performed during sleep modes without a clock. The comparator is enabled continuously, and changes of the comparator state are detected asynchronously. When a toggle occurs, the Power Manager will start CLK\_AC\_DIG to register the appropriate peripheral events and interrupts. The CLK\_AC\_DIG clock is then disabled again automatically, unless configured to wake up the system from sleep.

## Related Links

[Electrical Characteristics](#) on page 606

### Single-Shot

Single-shot operation is selected by writing COMPCTRLx.SINGLE to '1'. During single-shot operation, the comparator is normally idle. The user starts a single comparison by writing '1' to the respective Start Comparison bit in the write-only Control B register (CTRLB.START<sub>x</sub>). The comparator is enabled, and after the start-up time has passed, a single comparison is done and STATUSA is updated. Appropriate peripheral events and interrupts are also generated. No new comparisons will be performed.

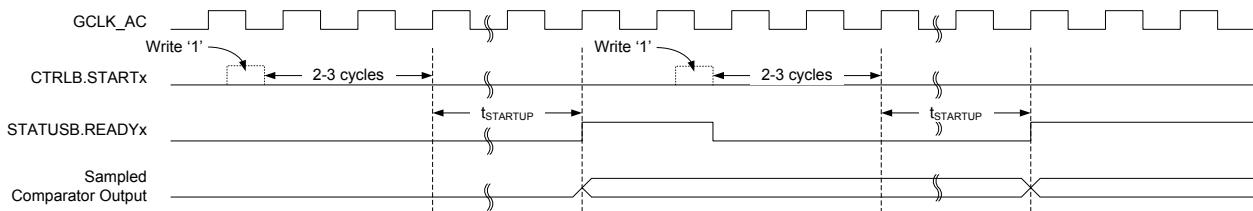

Writing '1' to CTRLB.STARTx also clears the Comparator x Ready bit in the Status B register (STATUSB.READYx). STATUSB.READYx is set automatically by hardware when the single comparison has completed.

To remove the need for polling, an additional means of starting the comparison is also available. A read of the Status C register (STATUSC) will start a comparison on all comparators currently configured for single-shot operation. The read will stall the bus until all enabled comparators are ready. If a comparator is already busy with a comparison, the read will stall until the current comparison is compete, and a new comparison will not be started.

A single-shot measurement can also be triggered by the Event System. Setting the Comparator x Event Input bit in the Event Control Register (EVCTRL.COMPEIx) enables triggering on incoming peripheral events. Each comparator can be triggered independently by separate events. Event-triggered operation is similar to user-triggered operation; the difference is that a peripheral event from another hardware module causes the hardware to automatically start the comparison and clear STATUSB.READYx.

To detect an edge of the comparator output in single-shot operation for the purpose of interrupts, the result of the current measurement is compared with the result of the previous measurement (one sampling period earlier). An example of single-shot operation is shown in the figure below.

**Figure 30-2. Single-Shot Example**

For low-power operation, event-triggered measurements can be performed during sleep modes. When the event occurs, the Power Manager will start CLK\_AC\_DIG. The comparator is enabled, and after the startup time has passed, a comparison is done and appropriate peripheral events and interrupts are also generated. The comparator and CLK\_AC\_DIG are then disabled again automatically, unless configured to wake up the system from sleep.

#### Related Links

[Electrical Characteristics](#) on page 606

### 30.6.3. Selecting Comparator Inputs

Each comparator has one positive and one negative input. The positive input is one of the external input pins (AINx). The negative input can be fed either from an external input pin (AINx) or from one of the several internal reference voltage sources common to all comparators. The user selects the input source as follows:

- The positive input is selected by the Positive Input MUX Select bit group in the Comparator Control register (COMPCTRLx.MUXPOS)
- The negative input is selected by the Negative Input MUX Select bit group in the Comparator Control register (COMPCTRLx.MUXNEG)

In the case of using an external I/O pin, the selected pin must be configured for analog use in the PORT Controller by disabling the digital input and output. The switching of the analog input multiplexers is controlled to minimize crosstalk between the channels. The input selection must be changed only while the individual comparator is disabled.

**Note:** For internal use of the comparison results by the CCL, this bit must be 0x1 or 0x2.

### 30.6.4. Window Operation

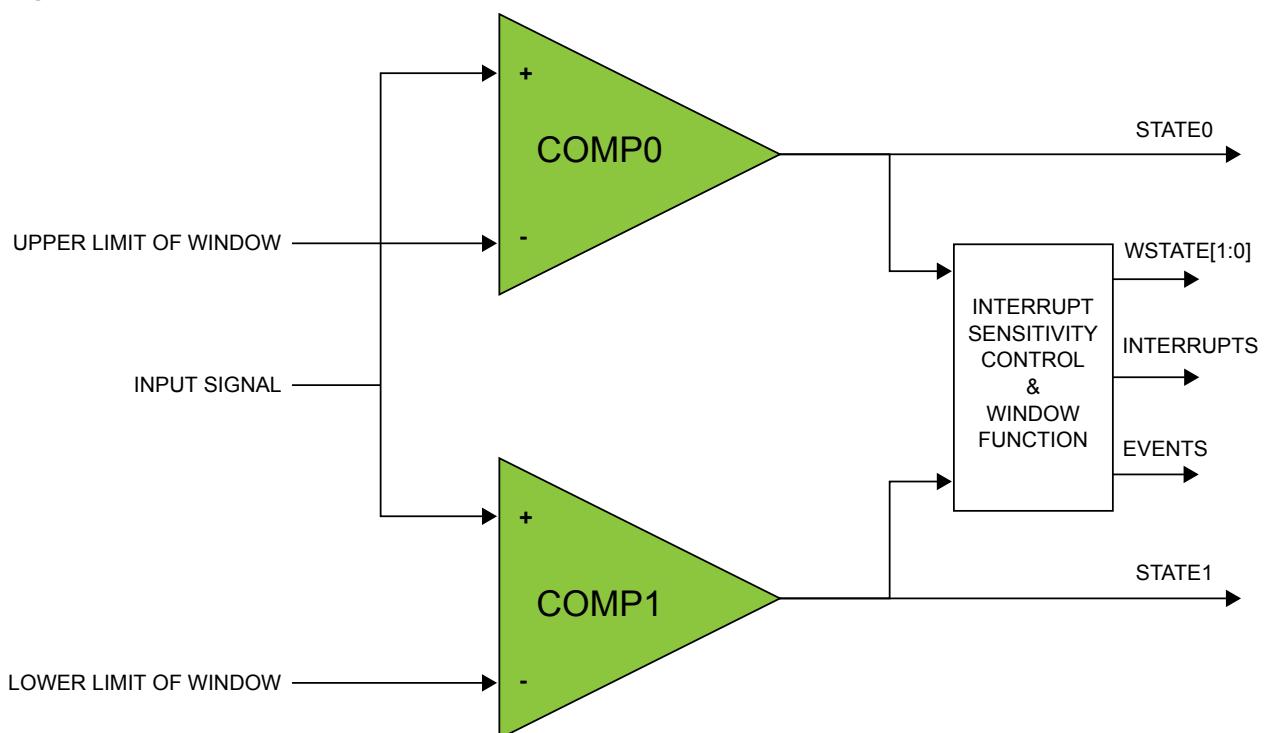

Each comparator pair can be configured to work together in window mode. In this mode, a voltage range is defined, and the comparators give information about whether an input signal is within this range or not. Window mode is enabled by the Window Enable x bit in the Window Control register (WINCTRL.WENx). Both comparators in a pair must have the same measurement mode setting in their respective Comparator Control Registers (COMPCTRLx.SINGLE).

To physically configure the pair of comparators for window mode, the same I/O pin must be chosen as positive input for each comparator, providing a shared input signal. The negative inputs define the range for the window. In [Figure 30-3](#), COMP0 defines the upper limit and COMP1 defines the lower limit of the window, as shown but the window will also work in the opposite configuration with COMP0 lower and COMP1 higher. The current state of the window function is available in the Window x State bit group of the Status register (STATUS.WSTATEx).

Window mode can be configured to generate interrupts when the input voltage changes to below the window, when the input voltage changes to above the window, when the input voltage changes into the window or when the input voltage changes outside the window. The interrupt selections are set by the Window Interrupt Selection bit field in the Window Control register (WINCTRL.WINTSEL). Events are generated using the inside/outside state of the window, regardless of whether the interrupt is enabled or not. Note that the individual comparator outputs, interrupts and events continue to function normally during window mode.

When the comparators are configured for window mode and single-shot mode, measurements are performed simultaneously on both comparators. Writing '1' to either Start Comparison bit in the Control B register (CTRLB.STARTx) will start a measurement. Likewise either peripheral event can start a measurement.

**Figure 30-3. Comparators in Window Mode**

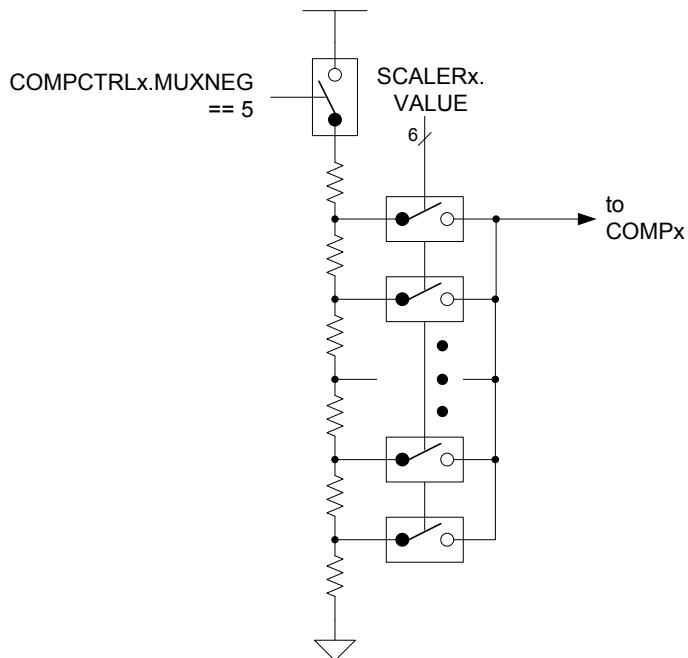

### 30.6.5. Voltage Doubler

The AC contains a voltage doubler that can reduce the resistance of the analog multiplexors when the supply voltage is below 2.5V. The voltage doubler is normally switched on/off automatically based on the supply level. When enabling the comparators, additional start-up time is required for the voltage doubler to settle. If the supply voltage is guaranteed to be above 2.5V, the voltage doubler can be disabled by writing the Low-Power Mux bit in the Control A register (CTRLA.LPMUX) to one. Disabling the voltage doubler saves power and reduces the start-up time.

### 30.6.6. $V_{DDANA}$ Scaler

The  $V_{DDANA}$  scaler generates a reference voltage that is a fraction of the device's supply voltage, with 64 levels. One independent voltage channel is dedicated for each comparator. The scaler of a comparator is enabled when the Negative Input Mux bit field in the respective Comparator Control register (COMPCTRLx.MUXNEG) is set to 0x5 and the comparator is enabled. The voltage of each channel is selected by the Value bit field in the Scaler x registers (SCALERx.VALUE).

Figure 30-4.  $V_{DDANA}$  Scaler

### 30.6.7. Input Hysteresis

Application software can selectively enable/disable hysteresis for the comparison. Applying hysteresis will help prevent constant toggling of the output, which can be caused by noise when the input signals are close to each other.

Hysteresis is enabled for each comparator individually by the Hysteresis Enable bit in the Comparator x Control register (COMPCTRLx.HYSTEN). Hysteresis is available only in continuous mode (COMPCTRLx.SINGLE=0).

### 30.6.8. Propagation Delay vs. Power Consumption

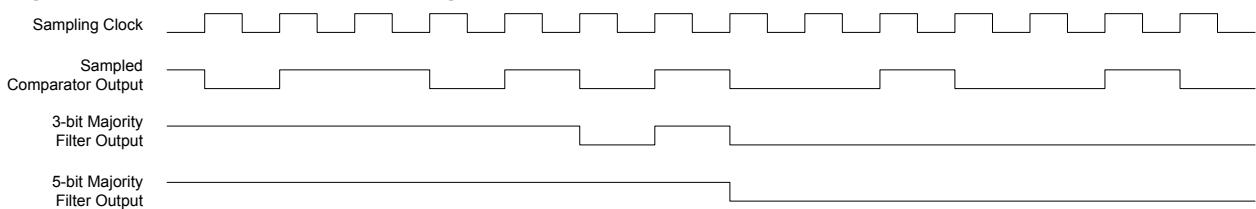

It is possible to trade off comparison speed for power efficiency to get the shortest possible propagation delay or the lowest power consumption. The speed setting is configured for each comparator individually by the Speed bit group in the Comparator x Control register (COMPCTRLx.SPEED). The Speed bits select the amount of bias current provided to the comparator, and as such will also affect the start-up time.

### 30.6.9. Filtering

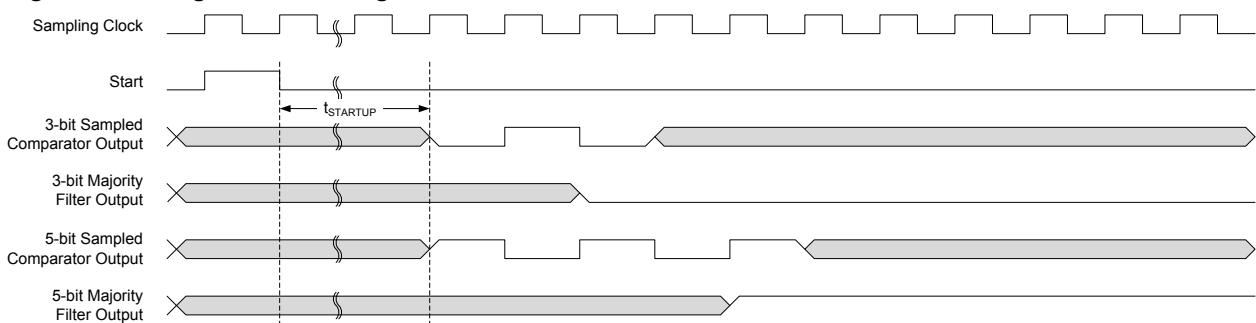

The output of the comparators can be filtered digitally to reduce noise. The filtering is determined by the Filter Length bits in the Comparator Control x register (COMPCTRLx.FLEN), and is independent for each comparator. Filtering is selectable from none, 3-bit majority ( $N=3$ ) or 5-bit majority ( $N=5$ ) functions. Any change in the comparator output is considered valid only if  $N/2+1$  out of the last  $N$  samples agree. The filter sampling rate is the GCLK\_AC frequency.

Note that filtering creates an additional delay of  $N-1$  sampling cycles from when a comparison is started until the comparator output is validated. For continuous mode, the first valid output will occur when the required number of filter samples is taken. Subsequent outputs will be generated every cycle based on the current sample plus the previous  $N-1$  samples, as shown in [Figure 30-5](#). For single-shot mode, the comparison completes after the  $N$ th filter sample, as shown in [Figure 30-6](#).

**Figure 30-5. Continuous Mode Filtering**

**Figure 30-6. Single-Shot Filtering**

During sleep modes, filtering is supported only for single-shot measurements. Filtering must be disabled if continuous measurements will be done during sleep modes, or the resulting interrupt/event may be generated incorrectly.

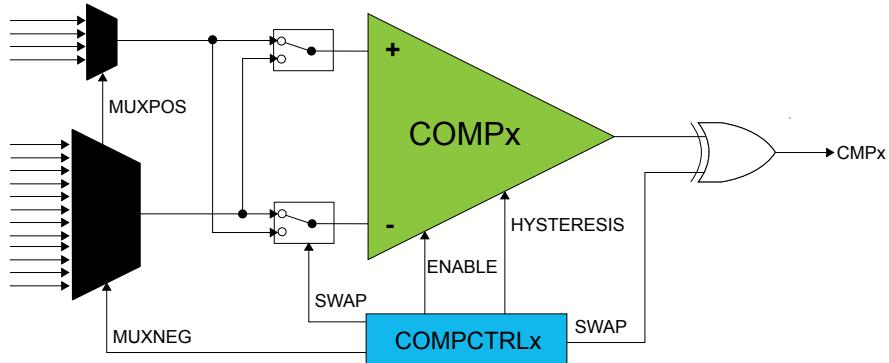

### 30.6.10. Comparator Output

The output of each comparator can be routed to an I/O pin by setting the Output bit group in the Comparator Control x register (COMPCTRLx.OUT). This allows the comparator to be used by external circuitry. Either the raw, non-synchronized output of the comparator or the CLK\_AC-synchronized version, including filtering, can be used as the I/O signal source. The output appears on the corresponding CMP[x] pin.

### 30.6.11. Offset Compensation

The Swap bit in the Comparator Control registers (COMPCTRLx.SWAP) controls switching of the input signals to a comparator's positive and negative terminals. When the comparator terminals are swapped, the output signal from the comparator is also inverted, as shown in [Figure 30-7](#). This allows the user to measure or compensate for the comparator input offset voltage. As part of the input selection, COMPCTRLx.SWAP can be changed only while the comparator is disabled.

**Figure 30-7. Input Swapping for Offset Compensation**

### 30.6.12. Interrupts

The AC has the following interrupt sources:

- Comparator (COMP0, COMP1): Indicates a change in comparator status.
- Window (WIN0): Indicates a change in the window status.

Comparator interrupts are generated based on the conditions selected by the Interrupt Selection bit group in the Comparator Control registers (COMPCTRLx.INTSEL). Window interrupts are generated based on the conditions selected by the Window Interrupt Selection bit group in the Window Control register (WINCTRL.WINTSEL[1:0]).

Each interrupt source has an interrupt flag associated with it. The interrupt flag in the Interrupt Flag Status and Clear (INTFLAG) register is set when the interrupt condition occurs. Each interrupt can be individually enabled by writing a one to the corresponding bit in the Interrupt Enable Set (INTENSET) register, and disabled by writing a one to the corresponding bit in the Interrupt Enable Clear (INTENCLR) register. An interrupt request is generated when the interrupt flag is set and the corresponding interrupt is enabled. The interrupt request remains active until the interrupt flag is cleared, the interrupt is disabled, or the AC is reset. See INFLAG register for details on how to clear interrupt flags. All interrupt requests from the peripheral are ORed together on system level to generate one combined interrupt request to the NVIC. The user must read the INTFLAG register to determine which interrupt condition is present.

Note that interrupts must be globally enabled for interrupt requests to be generated.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 30.6.13. Events

The AC can generate the following output events:

- Comparator (COMP0, COMP1): Generated as a copy of the comparator status
- Window (WIN0): Generated as a copy of the window inside/outside status

Output events must be enabled to be generated. Writing a one to an Event Output bit in the Event Control register (EVCTRL.COMPEO $x$ ) enables the corresponding output event. Writing a zero to this bit disables the corresponding output event. The events must be correctly routed in the Event System.

The AC can take the following action on an input event:

- Single-shot measurement
- Single-shot measurement in window mode

Writing a one to an Event Input bit into the Event Control register (EVCTRL.COMPEI $x$ ) enables the corresponding action on input event. Writing a zero to this bit disables the corresponding action on input

event. Note that if several events are connected to the AC, the enabled action will be taken on any of the incoming events. Refer to the Event System chapter for details on configuring the event system.

When EVCTRL.COMPEIx is one, the event will start a comparison on COMPx after the start-up time delay. In normal mode, each comparator responds to its corresponding input event independently. For a pair of comparators in window mode, either comparator event will trigger a comparison on both comparators simultaneously.

### 30.6.14. Sleep Mode Operation

The Run in Standby bits in the Comparator x Control registers (COMPCTRLx.RUNSTDBY) control the behavior of the AC during standby sleep mode. Each RUNSTDBY bit controls one comparator. When the bit is zero, the comparator is disabled during sleep, but maintains its current configuration. When the bit is one, the comparator continues to operate during sleep. Note that when RUNSTDBY is zero, the analog blocks are powered off for the lowest power consumption. This necessitates a start-up time delay when the system returns from sleep.

When RUNSTDBY is one, any enabled AC interrupt source can wake up the CPU. While the CPU is sleeping, single-shot comparisons are only triggerable by events. The AC can also be used during sleep modes where the clock used by the AC is disabled, provided that the AC is still powered (not in shutdown). In this case, the behavior is slightly different and depends on the measurement mode.

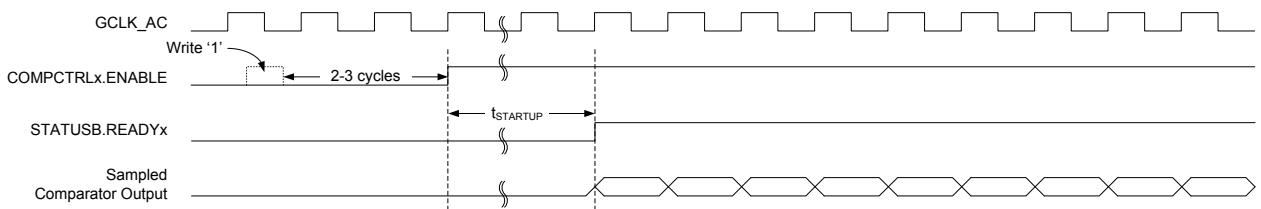

**Table 30-1. Sleep Mode Operation**

COMPCTRLx.MODE	RUNSTDBY=0	RUNSTDBY=1
0 (Continuous)	COMPx disabled	GCLK_AC_DIG stopped, COMPx enabled
1 (Single-shot)	COMPx disabled	GCLK_AC_DIG stopped, COMPx enabled only when triggered by an input event

#### 30.6.14.1. Continuous Measurement during Sleep

When a comparator is enabled in continuous measurement mode and GCLK\_AC\_DIG is disabled during sleep, the comparator will remain continuously enabled and will function asynchronously. The current state of the comparator is asynchronously monitored for changes. If an edge matching the interrupt condition is found, GCLK\_AC\_DIG is started to register the interrupt condition and generate events. If the interrupt is enabled in the Interrupt Enable registers (INTENCLR/SET), the AC can wake up the device; otherwise GCLK\_AC\_DIG is disabled until the next edge detection. Filtering is not possible with this configuration.

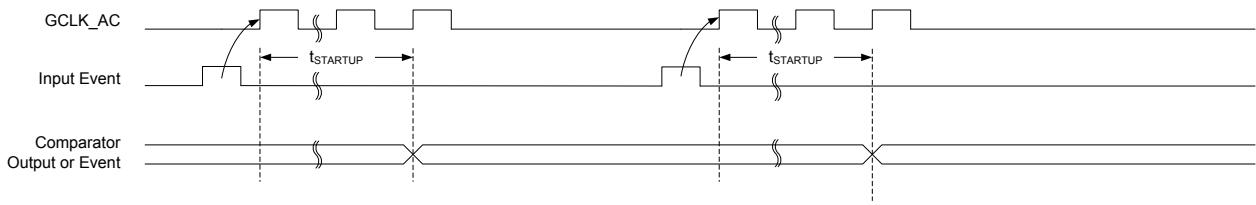

**Figure 30-8. Continuous Mode SleepWalking**

#### 30.6.14.2. Single-Shot Measurement during Sleep

For low-power operation, event-triggered measurements can be performed during sleep modes. When the event occurs, the Power Manager will start GCLK\_AC\_DIG. The comparator is enabled, and after the start-up time has passed, a comparison is done, with filtering if desired, and the appropriate peripheral events and interrupts are also generated, as the figure below. The comparator and GCLK\_AC\_DIG are then disabled again automatically, unless configured to wake the system from sleep. Filtering is allowed with this configuration.

**Figure 30-9. Single-Shot SleepWalking**

### 30.6.15. Synchronization

Due to asynchronicity between the main clock domain and the peripheral clock domains, some registers need to be synchronized when written or read.

The following bits are synchronized when written:

- Software Reset bit in control register (CTRLA.SWRST)
- Enable bit in control register (CTRLA.ENABLE)
- Enable bit in Comparator Control register (COMPCTRLn.ENABLE)

The following registers are synchronized when written:

- Window Control register (WINCTRL)

Required write-synchronization is denoted by the "Write-Synchronized" property in the register description.

## 30.8. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16- and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers are optionally write-protected by the Peripheral Access Controller (PAC). Optional PAC write-protection is denoted by the "PAC Write-Protection" property in each individual register description. For details, refer to *Register Access Protection*.

Some registers are synchronized when read and/or written. Synchronization is denoted by the "Write-Synchronized" or the "Read-Synchronized" property in each individual register description. For details, refer to *Synchronization*.

Some registers are enable-protected, meaning they can only be written when the peripheral is disabled. Enable-protection is denoted by the "Enable-Protected" property in each individual register description.

### 30.8.1. Control A

**Name:** CTRLA  
**Offset:** 0x00  
**Reset:** 0x00  
**Property:** PAC Write-Protection, Write-Synchronized

Bit	7	6	5	4	3	2	1	0
	LPMUX					RUNSTDBY	ENABLE	SWRST
Access	R/W					R/W	R/W	R/W
Reset	0					0	0	0

#### Bit 7 – LPMUX: Low-Power Mux

This bit is not synchronized

Value	Description
0	The analog input muxes have low resistance, but consume more power at lower voltages (e.g., are driven by the voltage doubler).
1	The analog input muxes have high resistance, but consume less power at lower voltages (e.g., the voltage doubler is disabled).

#### Bit 2 – RUNSTDBY: Run in Standby

This bit controls the behavior of the comparators during standby sleep mode.

This bit is not synchronized

Value	Description
0	The comparator pair is disabled during sleep.
1	The comparator pair continues to operate during sleep.

#### Bit 1 – ENABLE: Enable

Due to synchronization, there is delay from updating the register until the peripheral is enabled/disabled. The value written to CTRLA.ENABLE will read back immediately after being written. SYNCBUSY.ENABLE is set. SYNCBUSY.ENABLE is cleared when the peripheral is enabled/disabled.

Value	Description
0	The AC is disabled.
1	The AC is enabled. Each comparator must also be enabled individually by the Enable bit in the Comparator Control register (COMPCTRLn.ENABLE).

#### Bit 0 – SWRST: Software Reset

Writing a '0' to this bit has no effect.

Writing a '1' to this bit resets all registers in the AC to their initial state, and the AC will be disabled.

Writing a '1' to CTRLA.SWRST will always take precedence, meaning that all other writes in the same write-operation will be discarded.

Due to synchronization, there is a delay from writing CTRLA.SWRST until the reset is complete. CTRLA.SWRST and SYNCBUSY.SWRST will both be cleared when the reset is complete.

Value	Description
0	There is no reset operation ongoing.
1	The reset operation is ongoing.

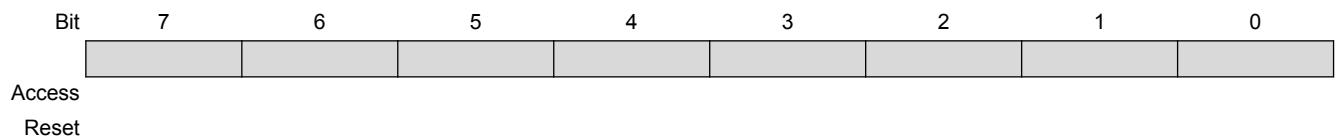

### 30.8.2. Control B

**Name:** CTRLB

**Offset:** 0x01

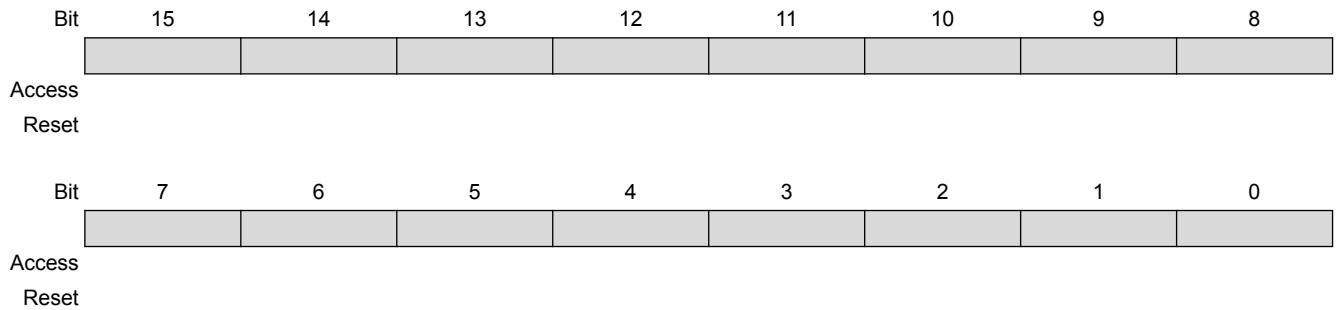

**Reset:** 0x00

**Property:** –

### 30.8.3. Event Control

**Name:** EVCTRL  
**Offset:** 0x02  
**Reset:** 0x0000  
**Property:** PAC Write-Protection, Enable-Protected

### 30.8.4. Interrupt Enable Clear

This register allows the user to disable an interrupt without doing a read-modify-write operation. Changes in this register will also be reflected in the Interrupt Enable Set register (INTENSET).

**Name:** INTENCLR

**Offset:** 0x04

**Reset:** 0x00

**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access								

Reset

### 30.8.5. Interrupt Enable Set

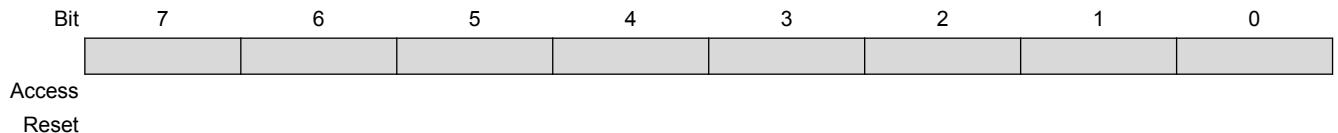

This register allows the user to enable an interrupt without doing a read-modify-write operation. Changes in this register will also be reflected in the Interrupt Enable Clear register (INTENCLR).

**Name:** INTENSET

**Offset:** 0x05

**Reset:** 0x00

**Property:** PAC Write-Protection

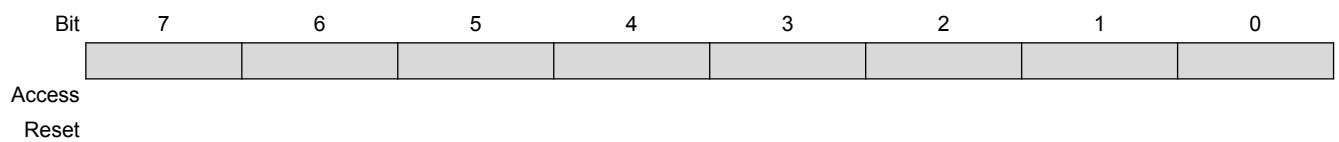

### 30.8.6. Interrupt Flag Status and Clear

**Name:** INTFLAG

**Offset:** 0x06

**Reset:** 0x00

**Property:** –

### 30.8.7. Status A

**Name:** STATUSA

**Offset:** 0x08

**Reset:** 0x00

**Property:** –

Bit	7	6	5	4	3	2	1	0
				WSTATE0[1:0]				
Access			R	R				
Reset			0	0				

#### Bits 5:4 – WSTATE0[1:0]: Window 0 Current State

These bits show the current state of the signal if the window 0 mode is enabled.

Value	Name	Description
0x0	ABOVE	Signal is above window
0x1	INSIDE	Signal is inside window
0x2	BELOW	Signal is below window
0x3		Reserved

### 30.8.8. Status B

**Name:** STATUSB

**Offset:** 0x09

**Reset:** 0x00

**Property:** –

Bit	7	6	5	4	3	2	1	0
	SYNCBUSY							
Access	R							
Reset	0							

#### Bit 7 – SYNCBUSY: Synchronization Busy

This bit is cleared when the synchronization of registers between the clock domains is complete.

This bit is set when the synchronization of registers between clock domains is started.

### 30.8.9. Status A

**Name:** STATUSC

**Offset:** 0x0A

**Reset:** 0x00

**Property:** –

Bit	7	6	5	4	3	2	1	0
				WSTATE0[1:0]				
Access			R	R				
Reset			0	0				

#### Bits 5:4 – WSTATE0[1:0]: Window 0 Current State

These bits show the current state of the signal if the window 0 mode is enabled.

Value	Name	Description
0x0	ABOVE	Signal is above window
0x1	INSIDE	Signal is inside window
0x2	BELOW	Signal is below window
0x3		Reserved

### 30.8.10. Window Control

**Name:** WINCTRL  
**Offset:** 0x0C  
**Reset:** 0x00  
**Property:** PAC Write-Protection, Write-Synchronized

Bit	7	6	5	4	3	2	1	0
						WINTSEL0[1:0]		WEN0
Access						R/W	R/W	R/W
Reset						0	0	0

#### Bits 2:1 – WINTSEL0[1:0]: Window 0 Interrupt Selection

These bits configure the interrupt mode for the comparator window 0 mode.

Value	Name	Description
0x0	ABOVE	Interrupt on signal above window
0x1	INSIDE	Interrupt on signal inside window
0x2	BELOW	Interrupt on signal below window
0x3	OUTSIDE	Interrupt on signal outside window

#### Bit 0 – WEN0: Window 0 Mode Enable

Value	Description
0	Window mode is disabled for comparators 0 and 1.
1	Window mode is enabled for comparators 0 and 1.

### 30.8.11. Comparator Control n

**Name:** COMPCTRLn  
**Offset:** 0x10+n\*0x4 [n=0..1]  
**Reset:** 0x00000000  
**Property:** PAC Write-Protection, Write-Synchronized

Bit	31	30	29	28	27	26	25	24
	FLEN[2:0]							
Access					R/W	R/W	R/W	
Reset					0	0	0	
Bit	23	22	21	20	19	18	17	16
	OUT[1:0]							
Access					R/W	R/W	R/W	
Reset					0	0	0	
Bit	15	14	13	12	11	10	9	8
	SWAP		MUXPOS[1:0]					
Access	R/W		R/W	R/W				
Reset	0		0	0				
Bit	7	6	5	4	3	2	1	0
	INTSEL[1:0]		SPEED[1:0]		SINGLE	ENABLE		
Access	R/W	R/W		R/W	R/W	R/W	R/W	
Reset	0	0		0	0	0	0	

#### Bits 26:24 – FLEN[2:0]: Filter Length

These bits configure the filtering for comparator n. COMPCTRLn.FLEN can only be written while COMPCTRLn.ENABLE is zero.

These bits are not synchronized.

Value	Name	Description
0x0	OFF	No filtering
0x1	MAJ3	3-bit majority function (2 of 3)
0x2	MAJ5	5-bit majority function (3 of 5)
0x3-0x7	N/A	Reserved

#### Bit 19 – HYST: Hysteresis Level

This bit indicates the hysteresis mode of comparator n. Hysteresis is available only for continuous mode (COMPCTRLn. SINGLE=0). COMPCTRLn.HYST can be written only while COMPCTRLn.ENABLE is zero.

This bit is not synchronized.

These bits are not synchronized.

Value	Name
0	Hysteresis is disabled.
1	Hysteresis is enabled.

#### Bits 17:16 – OUT[1:0]: Output

These bits configure the output selection for comparator n. COMPCTRLn.OUT can be written only while COMPCTRLn.ENABLE is zero.

These bits are not synchronized.

Value	Name	Description
0x0	OFF	The output of COMPn is not routed to the COMPn I/O port
0x1	ASYNC	The asynchronous output of COMPn is routed to the COMPn I/O port
0x2	SYNC	The synchronous output (including filtering) of COMPn is routed to the COMPn I/O port
0x3	N/A	Reserved

#### Bit 15 – SWAP: Swap Inputs and Invert

This bit swaps the positive and negative inputs to COMPn and inverts the output. This function can be used for offset cancellation. COMPCTRLn.SWAP can be written only while COMPCTRLn.ENABLE is zero.

These bits are not synchronized.

Value	Description
0	The output of MUXPOS connects to the positive input, and the output of MUXNEG connects to the negative input.
1	The output of MUXNEG connects to the positive input, and the output of MUXPOS connects to the negative input.

#### Bits 13:12 – MUXPOS[1:0]: Positive Input Mux Selection

These bits select which input will be connected to the positive input of comparator n. COMPCTRLn.MUXPOS can be written only while COMPCTRLn.ENABLE is zero.

These bits are not synchronized.

Value	Name	Description
0x0	PIN0	I/O pin 0
0x1	PIN1	I/O pin 1
0x2	PIN2	I/O pin 2
0x3	PIN3	I/O pin 3

#### Bits 6:5 – INTSEL[1:0]: Interrupt Selection

These bits select the condition for comparator n to generate an interrupt or event. COMPCTRLn.INTSEL can be written only while COMPCTRLn.ENABLE is zero.

These bits are not synchronized.

Value	Name	Description
0x0	TOGGLE	Interrupt on comparator output toggle
0x1	RISING	Interrupt on comparator output rising
0x2	FALLING	Interrupt on comparator output falling
0x3	EOC	Interrupt on end of comparison (single-shot mode only)

#### **Bits 3:2 – SPEED[1:0]: Speed Selection**

This bit indicates the speed/propagation delay mode of comparator n. COMPCTRLn.SPEED can be written only while COMPCTRLn.ENABLE is zero.

These bits are not synchronized.

Value	Name	Description
0x0	LOW	Low speed
0x1	HIGH	High speed
0x2-0x3	N/A	Reserved

#### **Bit 1 – SINGLE: Single-Shot Mode**

This bit determines the operation of comparator n. COMPCTRLn.SINGLE can be written only while COMPCTRLn.ENABLE is zero.

These bits are not synchronized.

Value	Description
0	Comparator n operates in continuous measurement mode.
1	Comparator n operates in single-shot mode.

#### **Bit 0 – ENABLE: Enable**

Writing a zero to this bit disables comparator n.

Writing a one to this bit enables comparator n.

Due to synchronization, there is delay from updating the register until the comparator is enabled/disabled. The value written to COMPCTRLn.ENABLE will read back immediately after being written.

SYNCBUSY.COMPCTRLn is set. SYNCBUSY.COMPCTRLn is cleared when the peripheral is enabled/disabled.

Writing a one to COMPCTRLn.ENABLE will prevent further changes to the other bits in COMPCTRLn. These bits remain protected until COMPCTRLn.ENABLE is written to zero and the write is synchronized.

### 30.8.12. Scaler n

**Name:** SCALERn  
**Offset:** 0x20+n\*0x1 [n=0..1]  
**Reset:** 0x00  
**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
	VALUE[5:0]							
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

#### Bits 5:0 – VALUE[5:0]: Scaler Value

These bits define the scaling factor for channel n of the V<sub>DD</sub> voltage scaler. The output voltage, V<sub>SCALE</sub>, is:

$$V_{\text{SCALE}} = \frac{V_{\text{DD}} \cdot (\text{VALUE}+1)}{64}$$

## 31. DAC – Digital-to-Analog Converter

### 31.1. Overview

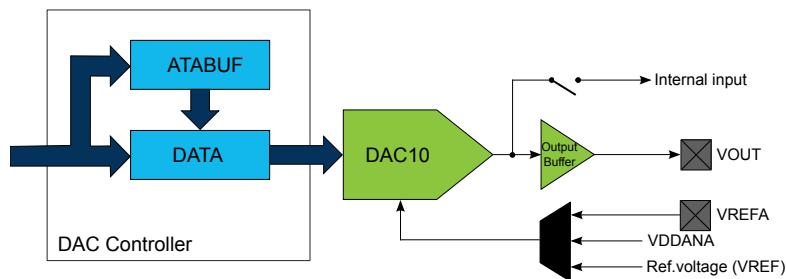

The Digital-to-Analog Converter (DAC) converts a digital value to a voltage. The DAC has one channel with 10-bit resolution, and it is capable of converting up to 350,000 samples per second (350ksps).

### 31.2. Features

- DAC with 10-bit resolution
- Up to 350ksps conversion rate
- Multiple trigger sources
- High-drive capabilities
- Output can be used as input to the Analog Comparator (AC)

### 31.3. Block Diagram

Figure 31-1. DAC Block Diagram

### 31.4. Signal Description

Signal Name	Type	Description
VOUT	Analog output	DAC output
VREFA	Analog input	External reference

#### Related Links

[I/O Multiplexing and Considerations](#) on page 27

### 31.5. Product Dependencies

In order to use this peripheral, other parts of the system must be configured correctly, as described below.

#### 31.5.1. I/O Lines

Using the DAC Controller's I/O lines requires the I/O pins to be configured using the port configuration (PORT).

#### Related Links

[PORT - I/O Pin Controller](#) on page 320

### 31.5.2. Power Management

The DAC will continue to operate in any sleep mode where the selected source clock is running.

The DAC interrupts can be used to wake up the device from sleep modes.

Events connected to the event system can trigger other operations in the system without exiting sleep modes.

#### Related Links

[PM – Power Manager](#) on page 129

### 31.5.3. Clocks

The DAC bus clock (CLK\_DAC\_APB) can be enabled and disabled by the Power Manager, and the default state of CLK\_DAC\_APB can be found in the *Peripheral Clock Masking* section.

A generic clock (GCLK\_DAC) is required to clock the DAC Controller. This clock must be configured and enabled in the Generic Clock Controller before using the DAC Controller. Refer to *GCLK – Generic Clock Controller* for details.

This generic clock is asynchronous to the bus clock (CLK\_DAC\_APB). Due to this asynchronicity, writes to certain registers will require synchronization between the clock domains. Refer to [Synchronization](#) for further details.

#### Related Links

[GCLK - Generic Clock Controller](#) on page 108

### 31.5.4. Interrupts

The interrupt request line is connected to the interrupt controller. Using the DAC Controller interrupt(s) requires the interrupt controller to be configured first.

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 31.5.5. Events

The events are connected to the Event System.

#### Related Links

[EVSYS – Event System](#) on page 349

### 31.5.6. Debug Operation

When the CPU is halted in debug mode the DAC will halt normal operation. Any on-going conversions will be completed. The DAC can be forced to continue normal operation during debugging. If the DAC is configured in a way that requires it to be periodically serviced by the CPU through interrupts or similar, improper operation or data loss may result during debugging.

### 31.5.7. Register Access Protection

All registers with write-access can be write-protected optionally by the Peripheral Access Controller (PAC), except the following registers:

- Interrupt Flag Status and Clear (INTFLAG) register
- Data Buffer (DATABUF) register

Optional write-protection by the Peripheral Access Controller (PAC) is denoted by the "PAC Write-Protection" property in each individual register description.

PAC write-protection does not apply to accesses through an external debugger

#### Related Links

[PAC - Peripheral Access Controller](#) on page 45

### 31.5.8. Analog Connections

The DAC has one output pin (VOUT) and one analog input pin (VREFA) that must be configured first.

When internal input is used, it must be enabled before DAC Controller is enabled.

## 31.6. Functional Description

### 31.6.1. Principle of Operation

The DAC converts the digital value located in the Data register (DATA) into an analog voltage on the DAC output (VOUT).

A conversion is started when new data is written to the Data register. The resulting voltage is available on the DAC output after the conversion time. A conversion can also be started by input events from the Event System.

### 31.6.2. Basic Operation

#### 31.6.2.1. Initialization

The following registers are enable-protected, meaning they can only be written when the DAC is disabled (CTRLA.ENABLE is zero):

- Control B register (CTRLB)
- Event Control register (EVCTRL)

Enable-protection is denoted by the Enable-Protected property in the register description.

Before enabling the DAC, it must be configured by selecting the voltage reference using the Reference Selection bits in the Control B register (CTRLB.REFSEL).

#### 31.6.2.2. Enabling, Disabling and Resetting

The DAC Controller is enabled by writing a '1' to the Enable bit in the Control A register (CTRLA.ENABLE). The DAC Controller is disabled by writing a '0' to CTRLA.ENABLE.

The DAC Controller is reset by writing a '1' to the Software Reset bit in the Control A register (CTRLA.SWRST). All registers in the DAC will be reset to their initial state, and the DAC Controller will be disabled. Refer to the CTRLA register for details.

#### 31.6.2.3. Enabling the Output Buffer

To enable the DAC output on the V<sub>OUT</sub> pin, the output driver must be enabled by writing a one to the External Output Enable bit in the Control B register (CTRLB.EOEN).

The DAC output buffer provides a high-drive-strength output, and is capable of driving both resistive and capacitive loads. To minimize power consumption, the output buffer should be enabled only when external output is needed.

#### 31.6.2.4. Digital to Analog Conversion

The DAC converts a digital value (stored in the DATA register) into an analog voltage. The conversion range is between GND and the selected DAC voltage reference. The default voltage reference is the internal reference voltage. Other voltage reference options are the analog supply voltage (VDDANA) and the external voltage reference (VREFA). The voltage reference is selected by writing to the Reference Selection bits in the Control B register (CTRLB.REFSEL).

The output voltage from the DAC can be calculated using the following formula:

$$V_{\text{OUT}} = \frac{\text{DATA}}{0x3FF} \cdot V_{\text{REF}}$$

A new conversion starts as soon as a new value is loaded into DATA. DATA can either be loaded via the APB bus during a CPU write operation, using DMA, or from the DATABUF register when a START event occurs. Refer to [Events](#) for details. As there is no automatic indication that a conversion is done, the sampling period must be greater than or equal to the specified conversion time.

### 31.6.3. Interrupts

The DAC Controller has the following interrupt sources:

- Data Buffer Empty (EMPTY): Indicates that the internal data buffer of the DAC is empty.
- Underrun (UNDERRUN): Indicates that the internal data buffer of the DAC is empty and a DAC start of conversion event occurred. Refer to [Events](#) for details.

Each interrupt source has an interrupt flag associated with it. The interrupt flag in the Interrupt Flag Status and Clear register (INTFLAG) is set when the interrupt condition occurs. Each interrupt can be individually enabled by writing a one to the corresponding bit in the Interrupt Enable Set register (INTENSET), and disabled by writing a one to the corresponding bit in the Interrupt Enable Clear register (INTENCLR).

An interrupt request is generated when the interrupt flag is set and the corresponding interrupt is enabled. The interrupt request remains active until the interrupt flag is cleared, the interrupt is disabled or the DAC is reset. See INTFLAG register for details on how to clear interrupt flags.

All interrupt requests from the peripheral are ORed together on system level to generate one combined interrupt request to the NVIC. The user must read the INTFLAG register to determine which interrupt condition is present.

Note that interrupts must be globally enabled for interrupt requests to be generated..

#### Related Links

[Nested Vector Interrupt Controller](#) on page 41

### 31.6.4. Events

The DAC Controller can generate the following output events:

- Data Buffer Empty (EMPTY): Generated when the internal data buffer of the DAC is empty. Refer to [DMA Operation](#) for details.

Writing a '1' to an Event Output bit in the Event Control register (EVCTRL.EMPTYEO) enables the corresponding output event. Writing a '0' to this bit disables the corresponding output event.

The DAC can take the following action on an input event:

- Start Conversion (START): DATABUF value is transferred into DATA as soon as the DAC is ready for the next conversion, and then conversion is started. START is considered as asynchronous to GCLK\_DAC thus it is resynchronized in DAC Controller. Refer to [Digital to Analog Conversion](#) for details.

Writing a '1' to an Event Input bit in the Event Control register (EVCTRL.STARTEI) enables the corresponding action on an input event. Writing a '0' to this bit disables the corresponding action on input event.

**Note:** When several events are connected to the DAC Controller, the enabled action will be taken on any of the incoming events.

By default, DAC Controller detects rising edge events. Falling edge detection can be enabled by writing a '1' to EVCTRL.INVEIx.

#### Related Links

[EVSYS – Event System](#) on page 349

### 31.6.5. Sleep Mode Operation

The generic clock for the DAC is running in idle sleep mode. If the Run In Standby bit in the Control A register (CTRLA.RUNSTDBY) is one, the DAC output buffer will keep its value in standby sleep mode. If CTRLA.RUNSTDBY is zero, the DAC output buffer will be disabled in standby sleep mode.

### 31.6.6. Synchronization

Due to the asynchronicity between main clock domain and the peripheral clock domains, some registers need to be synchronized when written or read. A register can require:

- Synchronization when written
- Synchronization when read
- Synchronization when written and read
- No synchronization

When executing an operation that requires synchronization, the will be set immediately, and cleared when synchronization is complete.

If an operation that requires synchronization is executed while its busy bit is one, the operation is discarded and an error is generated.

The following bits need synchronization when written:

- Software Reset bit in the Control A register (CTRLA.SWRST)
- Enable bit in the Control A register (CTRLA.ENABLE)
- All bits in the Data register (DATA)
- All bits in the Data Buffer register (DATABUF)

Write-synchronization is denoted by the Write-Synchronized property in the register description.

### 31.6.7. Additional Features

#### 31.6.7.1. DAC as an Internal Reference

The DAC output can be internally enabled as input to the analog comparator. This is enabled by writing a one to the Internal Output Enable bit in the Control B register (CTRLB.IOEN). It is possible to have the internal and external output enabled simultaneously.

The DAC output can also be enabled as input to the Analog-to-Digital Converter. In this case, the output buffer must be enabled.

#### 31.6.7.2. Data Buffer

The Data Buffer register (DATABUF) and the Data register (DATA) are linked together to form a two-stage FIFO. The DAC uses the Start Conversion event to load data from DATABUF into DATA and start a new conversion. The Start Conversion event is enabled by writing a one to the Start Event Input bit in the Event Control register (EVCTRL.STARTEI). If a Start Conversion event occurs when DATABUF is empty, an Underrun interrupt request is generated if the Underrun interrupt is enabled.

The DAC can generate a Data Buffer Empty event when DATABUF becomes empty and new data can be loaded to the buffer. The Data Buffer Empty event is enabled by writing a one to the Empty Event Output bit in the Event Control register (EVCTRL.EMPTYEO). A Data Buffer Empty interrupt request is generated if the Data Buffer Empty interrupt is enabled.

### 31.6.7.3. Voltage Pump

When the DAC is used at operating voltages lower than 2.5V, the voltage pump must be enabled. This enabling is done automatically, depending on operating voltage.

The voltage pump can be disabled by writing a one to the Voltage Pump Disable bit in the Control B register (CTRLB.VPD). This can be used to reduce power consumption when the operating voltage is above 2.5V.

The voltage pump uses the asynchronous GCLK\_DAC clock, and requires that the clock frequency be at least four times higher than the sampling period.

## 31.7. Register Summary

Offset	Name	Bit Pos.								
0x00	CTRLA	7:0						RUNSTDBY	ENABLE	SWRST
0x01	CTRLB	7:0	REFSEL[1:0]				VPD	LEFTADJ	IOEN	EOEN
0x02	EVCTRL	7:0							EMPTYEO	STARTEI
0x03	Reserved									
0x04	INTENCLR	7:0						SYNCRDY	EMPTY	UNDERRUN
0x05	INTENSET	7:0						SYNCRDY	EMPTY	UNDERRUN

## 31.8. Register Description

Registers can be 8, 16, or 32 bits wide. Atomic 8-, 16- and 32-bit accesses are supported. In addition, the 8-bit quarters and 16-bit halves of a 32-bit register, and the 8-bit halves of a 16-bit register can be accessed directly.

Some registers are optionally write-protected by the Peripheral Access Controller (PAC). Optional PAC write-protection is denoted by the "PAC Write-Protection" property in each individual register description. For details, refer to [Register Access Protection](#).

Some registers are synchronized when read and/or written. Synchronization is denoted by the "Write-Synchronized" or the "Read-Synchronized" property in each individual register description. For details, refer to [Synchronization](#).

Some registers are enable-protected, meaning they can only be written when the peripheral is disabled. Enable-protection is denoted by the "Enable-Protected" property in each individual register description.

### 31.8.1. Control A

**Name:** CTRLA  
**Offset:** 0x00  
**Reset:** 0x00  
**Property:** PAC Write-Protection, Write-Synchronized

Bit	7	6	5	4	3	2	1	0
Access						RUNSTDBY	ENABLE	SWRST
Reset						0	0	0

#### Bit 2 – RUNSTDBY: Run in Standby

This bit is not synchronized

Value	Description
0	The DAC output buffer is disabled in standby sleep mode.
1	The DAC output buffer can be enabled in standby sleep mode.

#### Bit 1 – ENABLE: Enable DAC Controller

Due to synchronization there is delay from writing CTRLA.ENABLE until the peripheral is enabled/disabled. The value written to CTRLA.ENABLE will read back immediately and the corresponding bit in the Synchronization Busy register (SYNCBUSY.ENABLE) will be set. SYNCBUSY.ENABLE will be cleared when the operation is complete.

Value	Description
0	The peripheral is disabled or being disabled.
1	The peripheral is enabled or being enabled.

#### Bit 0 – SWRST: Software Reset

Writing '0' to this bit has no effect.

Writing '1' to this bit resets all registers in the DAC to their initial state, and the DAC will be disabled.

Writing a '1' to CTRLA.SWRST will always take precedence, meaning that all other writes in the same write-operation will be discarded.

Due to synchronization there is a delay from writing CTRLA.SWRST until the reset is complete. CTRLA.SWRST and SYNCBUSY.SWRST will both be cleared when the reset is complete.

Value	Description
0	There is no reset operation ongoing.
1	The reset operation is ongoing.

### 31.8.2. Control B

**Name:** CTRLB  
**Offset:** 0x01  
**Reset:** 0x00  
**Property:** PAC Write-Protection, Enable-Protected

Bit	7	6	5	4	3	2	1	0
	REFSEL[1:0]				VPD	LEFTADJ	IOEN	EOEN
Access	R/W	R/W			R/W	R/W	R/W	R/W
Reset	0	0			0	0	0	0

#### Bits 7:6 – REFSEL[1:0]: Reference Selection

This bit field selects the Reference Voltage for the DAC.

Value	Name	Description
0x0	VREF	Internal voltage reference
0x1	VDDANA	Analog voltage supply
0x2	VREFP	External reference
0x3		Reserved

#### Bit 3 – VPD: Voltage Pump Disabled

This bit controls the behavior of the voltage pump.

Value	Description
0	Voltage pump is turned on/off automatically
1	Voltage pump is disabled.

#### Bit 2 – LEFTADJ: Left-Adjusted Data

This bit controls how the 10-bit conversion data is adjusted in the Data and Data Buffer registers.

Value	Description
0	DATA and DATABUF registers are right-adjusted.
1	DATA and DATABUF registers are left-adjusted.

#### Bit 1 – IOEN: Internal Output Enable

Value	Description
0	Internal DAC output not enabled.
1	Internal DAC output enabled to be used by the AC.

#### Bit 0 – EOEN: External Output Enable

Value	Description
0	The DAC output is turned off.
1	The high-drive output buffer drives the DAC output to the $V_{OUT}$ pin.

### 31.8.3. Event Control

**Name:** EVCTRL  
**Offset:** 0x02  
**Reset:** 0x00  
**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access							EMPTYEO	STARTEI
Reset							0	0
							R/W	R/W

#### Bit 1 – EMPTYEO: Data Buffer Empty Event Output

This bit indicates whether or not the Data Buffer Empty event is enabled and will be generated when the Data Buffer register is empty.

Value	Description
0	Data Buffer Empty event is disabled and will not be generated.
1	Data Buffer Empty event is enabled and will be generated.

#### Bit 0 – STARTEI: Start Conversion Event Input

This bit indicates whether or not the Start Conversion event is enabled and data are loaded from the Data Buffer register to the Data register upon event reception.

Value	Description
0	A new conversion will not be triggered on any incoming event.
1	A new conversion will be triggered on any incoming event.

### 31.8.4. Interrupt Enable Clear

This register allows the user to disable an interrupt without doing a read-modify-write operation. Changes in this register will also be reflected in the Interrupt Enable Set register (INTENSET).

**Name:** INTENCLR

**Offset:** 0x04

**Reset:** 0x00

**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access						SYNCRDY	EMPTY	UNDERRUN
Reset						R/W	R/W	R/W

#### Bit 2 – SYNCRDY: Synchronization Ready Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will clear the Synchronization Ready Interrupt Enable bit, which disables the Synchronization Ready interrupt.

Value	Description
0	The Synchronization Ready interrupt is disabled.
1	The Synchronization Ready interrupt is enabled.

#### Bit 1 – EMPTY: Data Buffer Empty Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will clear the Data Buffer Empty Interrupt Enable bit, which disables the Data Buffer Empty interrupt.

Value	Description
0	The Data Buffer Empty interrupt is disabled.
1	The Data Buffer Empty interrupt is enabled.

#### Bit 0 – UNDERRUN: Underrun Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will clear the Data Buffer Underrun Interrupt Enable bit, which disables the Data Buffer Underrun interrupt.

Value	Description
0	The Data Buffer Underrun interrupt is disabled.
1	The Data Buffer Underrun interrupt is enabled.

### 31.8.5. Interrupt Enable Set

This register allows the user to disable an interrupt without doing a read-modify-write operation. Changes in this register will also be reflected in the Interrupt Enable Clear register (INTENCLR).

**Name:** INTENSET

**Offset:** 0x05

**Reset:** 0x00

**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
Access						SYNCRDY	EMPTY	UNDERRUN
Reset						R/W	R/W	R/W

#### Bit 2 – SYNCRDY: Synchronization Ready Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will clear the Synchronization Ready Interrupt Enable bit, which disables the Synchronization Ready interrupt.

Value	Description
0	The Synchronization Ready interrupt is disabled.
1	The Synchronization Ready interrupt is enabled.

#### Bit 1 – EMPTY: Data Buffer Empty Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will set the Data Buffer Empty Interrupt Enable bit, which enables the Data Buffer Empty interrupt.

Value	Description
0	The Data Buffer Empty interrupt is disabled.
1	The Data Buffer Empty interrupt is enabled.

#### Bit 0 – UNDERRUN: Underrun Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will set the Data Buffer Underrun Interrupt Enable bit, which enables the Data Buffer Underrun interrupt.

Value	Description
0	The Data Buffer Underrun interrupt is disabled.
1	The Data Buffer Underrun interrupt is enabled.

### 31.8.6. Interrupt Flag Status and Clear

**Name:** INTFLAG  
**Offset:** 0x06  
**Reset:** 0x00  
**Property:** PAC Write-Protection

Bit	7	6	5	4	3	2	1	0
						SYNCRDY	EMPTY	UNDERRUN
Access						R/W	R/W	R/W
Reset						0	0	0

#### Bit 2 – SYNCRDY: Synchronization Ready Interrupt Enable

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will clear the Synchronization Ready Interrupt Enable bit, which disables the Synchronization Ready interrupt.

Value	Description
0	The Synchronization Ready interrupt is disabled.
1	The Synchronization Ready interrupt is enabled.

#### Bit 1 – EMPTY: Data Buffer Empty

This flag is cleared by writing a '1' to it or by writing new data to DATABUF.

This flag is set when data is transferred from DATABUF to DATA, and the DAC is ready to receive new data in DATABUF, and will generate an interrupt request if INTENCLR/SET.EMPTY is one.

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will clear the Data Buffer Empty interrupt flag.

#### Bit 0 – UNDERRUN: Underrun

This flag is cleared by writing a '1' to it.

This flag is set when a start conversion event occurs when DATABUF is empty, and will generate an interrupt request if INTENCLR/SET.UNDERRUN is one.

Writing a '0' to this bit has no effect.

Writing a '1' to this bit will clear the Underrun interrupt flag.

### 31.8.7. Status

**Name:** STATUS

**Offset:** 0x07

**Reset:** 0x00

**Property:** -

Bit	7	6	5	4	3	2	1	0
	SYNCBUSY							
Access	R							
Reset	0							

#### **Bit 7 – SYNCBUSY: Synchronization Busy Status**

This bit is cleared when the synchronization of registers between the clock domains is complete.

This bit is set when the synchronization of registers between clock domains is started.

### 31.8.8. Data DAC

**Name:** DATA  
**Offset:** 0x08  
**Reset:** 0x0000  
**Property:** PAC Write-Protection, Write-Synchronized

Bit	15	14	13	12	11	10	9	8
DATA[15:8]								
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
DATA[7:0]								
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – DATA[15:0]: Data value to be converted

DATA register contains the 10-bit value that is converted to a voltage by the DAC. The adjustment of these 10 bits within the 16-bit register is controlled by CTRLB.LEFTADJ.

Table 31-1. Valid Data Bits

CTRLB.LEFTADJ	DATA	Description
0	DATA[9:0]	Right adjusted, 10-bits
1	DATA[15:6]	Left adjusted, 10-bits

### 31.8.9. Data Buffer

**Name:** DATABUF  
**Offset:** 0x0C  
**Reset:** 0x0000  
**Property:** Write-Synchronized

Bit	15	14	13	12	11	10	9	8
DATABUF[15:8]								
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
DATABUF[7:0]								
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – DATABUF[15:0]: Data Buffer

DATABUF contains the value to be transferred into DATA register.

## 32. PTC - Peripheral Touch Controller

### 32.1. Overview

The Peripheral Touch Controller (PTC) acquires signals in order to detect touch on capacitive sensors. The external capacitive touch sensor is typically formed on a PCB, and the sensor electrodes are connected to the analog front end of the PTC through the I/O pins in the device. The PTC supports both self- and mutual-capacitance sensors.

In mutual-capacitance mode, sensing is done using capacitive touch matrices in various X-Y configurations, including indium tin oxide (ITO) sensor grids. The PTC requires one pin per X-line and one pin per Y-line.

In self-capacitance mode, the PTC requires only one pin (Y-line) for each touch sensor.

The number of available pins and the assignment of X- and Y-lines is depending on both package type and device configuration. Refer to the Configuration Summary and I/O Multiplexing table for details.

### 32.2. Features

- Low-power, high-sensitivity, environmentally robust capacitive touch buttons, sliders, wheels and proximity sensing
  - Down to 8 $\mu$ A with 200ms scan rate
- Supports wake-up on touch from standby sleep mode
- Supports mutual capacitance and self-capacitance sensing
  - 6/10/16 buttons in self-capacitance mode, for 32-/48-/64- pins respectively
  - 60/120/256 buttons in mutual-capacitance mode, for 32-/48-/64- pins respectively
  - Mix-and-match mutual-and self-capacitance sensors
- One pin per electrode – no external components
- Load compensating charge sensing
  - Parasitic capacitance compensation and adjustable gain for superior sensitivity
- Zero drift over the temperature and V<sub>DD</sub> range
  - Auto calibration and re-calibration of sensors
- Single-shot and free-running charge measurement
- Hardware noise filtering and noise signal de-synchronization for high conducted immunity
- Selectable channel change delay allows choosing the settling time on a new channel, as required
- Acquisition-start triggered by command or through auto-triggering feature
- Low CPU utilization through interrupt on acquisition-complete
- Supported by the Atmel® QTouch® Composer development tools. See also AtmelStart and Atmel Studio documentation.

### 32.3. Block Diagram

Figure 32-1. PTC Block Diagram Mutual-Capacitance

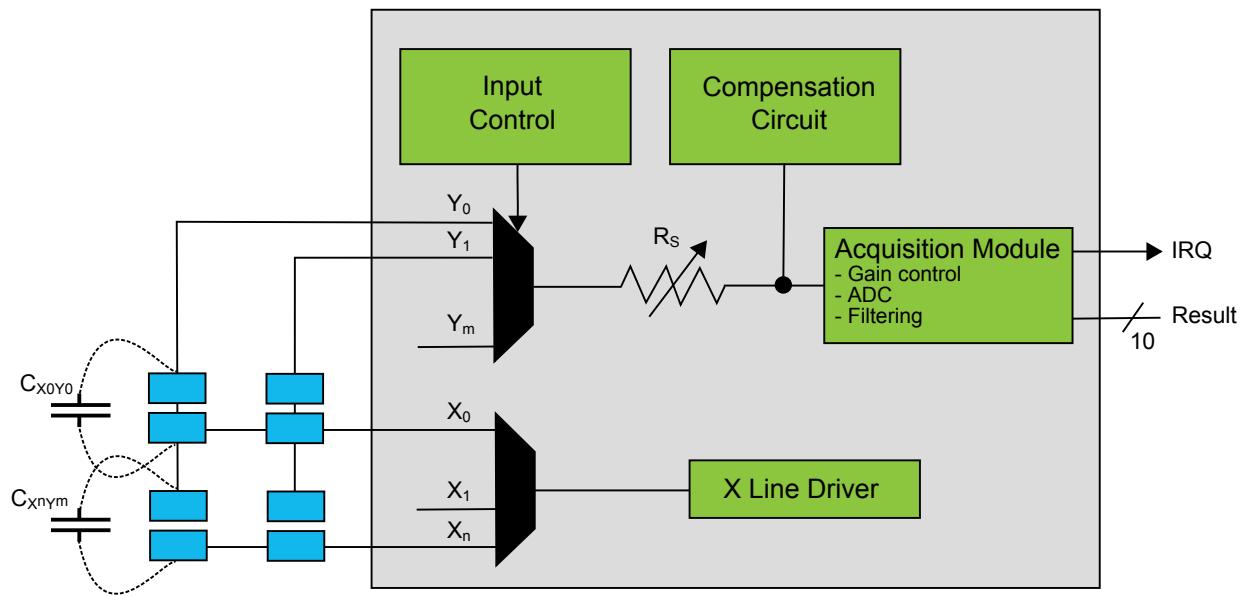

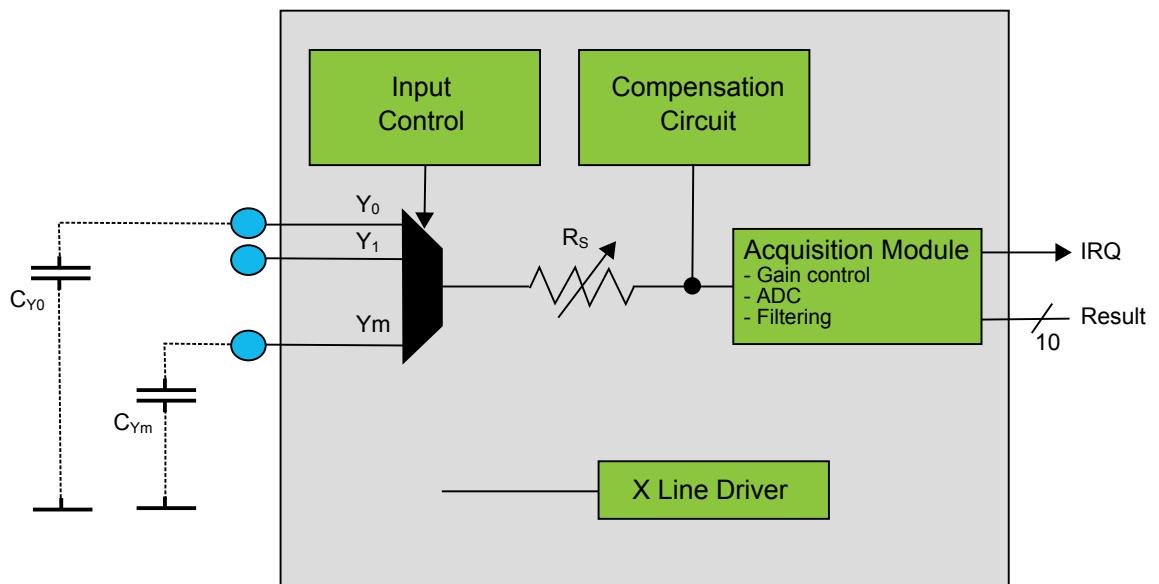

Figure 32-2. PTC Block Diagram Self-Capacitance

## 32.4. Signal Description

Table 32-1. Signal Description for PTC

Name	Type	Description
Y[m:0]	Analog	Y-line (Input/Output)
X[n:0]	Digital	X-line (Output)

**Note:** The number of X and Y lines are device dependent. Refer to *Configuration Summary* for details.

Refer to *I/O Multiplexing and Considerations* for details on the pin mapping for this peripheral. One signal can be mapped on several pins.

## 32.5. Product Dependencies

In order to use this Peripheral, configure the other components of the system as described in the following sections.

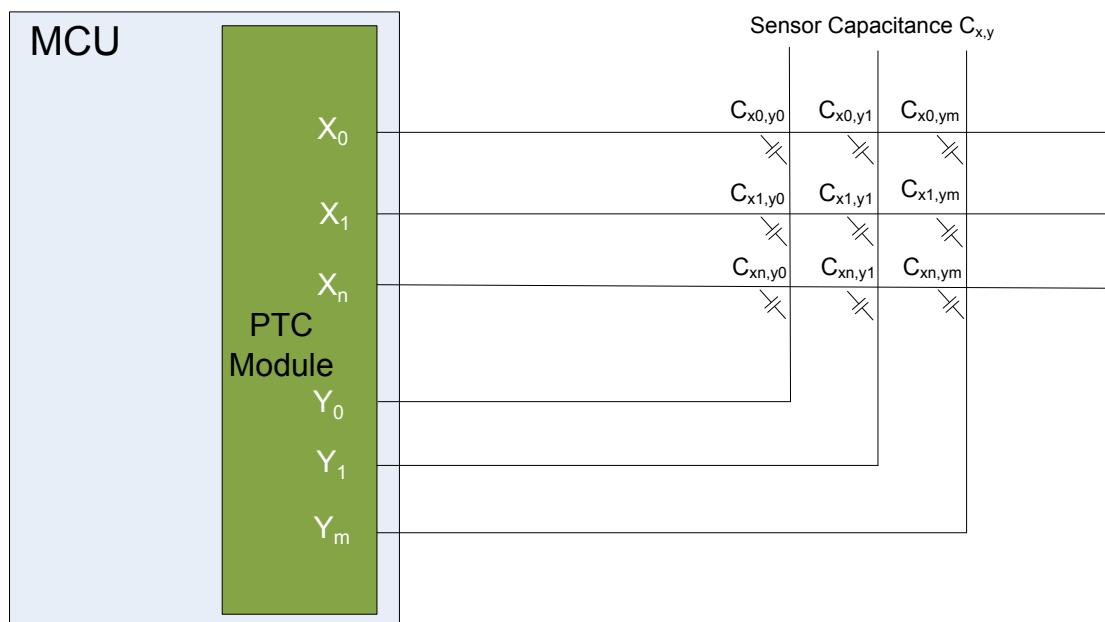

### 32.5.1. I/O Lines

The I/O lines used for analog X-lines and Y-lines must be connected to external capacitive touch sensor electrodes. External components are not required for normal operation. However, to improve the EMC performance, a series resistor of  $1\text{k}\Omega$  or more can be used on X-lines and Y-lines.

#### 32.5.1.1. Mutual-capacitance Sensor Arrangement

A mutual-capacitance sensor is formed between two I/O lines - an X electrode for transmitting and Y electrode for receiving. The mutual capacitance between the X and Y electrode is measured by the Peripheral Touch Controller.

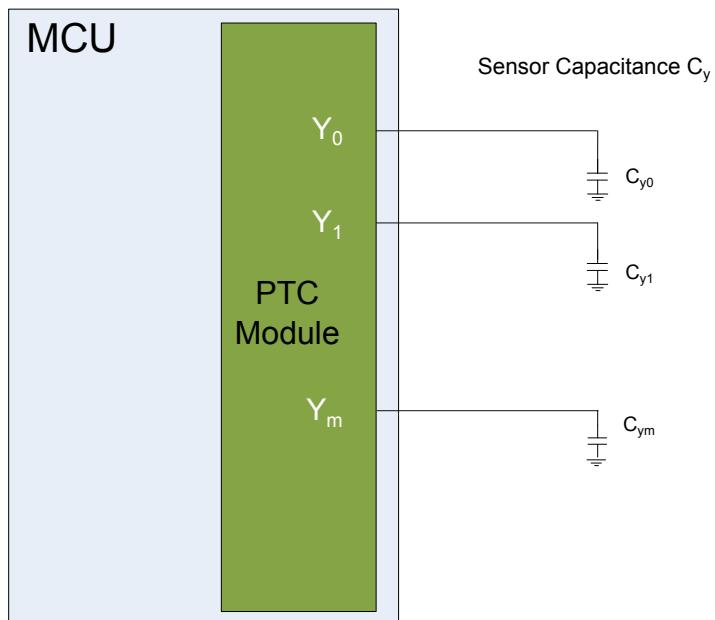

Figure 32-3. Mutual Capacitance Sensor Arrangement

### 32.5.1.2. Self-capacitance Sensor Arrangement

The self-capacitance sensor is connected to a single pin on the Peripheral Touch Controller through the Y electrode for receiving the signal. The sense electrode capacitance is measured by the Peripheral Touch Controller.

**Figure 32-4. Self-capacitance Sensor Arrangement**

For more information about designing the touch sensor, refer to Buttons, Sliders and Wheels Touch Sensor Design Guide on <http://www.atmel.com>.

### 32.5.2. Clocks

The PTC is clocked by the .

[PM – Power Manager](#) on page 129

## 32.6. Functional Description

In order to access the PTC, the user must use the QTouch Composer tool to configure and link the QTouch Library firmware with the application code. QTouch Library can be used to implement buttons, sliders, wheels and proximity sensor in a variety of combinations on a single interface.

**Figure 32-5. QTouch Library Usage**

For more information about QTouch Library, refer to the [Atmel QTouch Library Peripheral Touch Controller User Guide](#).

## 33. Electrical Characteristics

### 33.1. Disclaimer

All typical values are measured at  $T = 25^{\circ}\text{C}$  unless otherwise specified. All minimum and maximum values are valid across operating temperature and voltage unless otherwise specified.

### 33.2. Absolute Maximum Ratings

Stresses beyond those listed in the table may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Table 33-1. Absolute maximum ratings**

Symbol	Parameter	Min.	Max.	Units
$V_{\text{DD}}$	Power supply voltage	0	3.8	V
$I_{V\text{DD}}$	Current into a $V_{\text{DD}}$ pin	-	92 <sup>(1)</sup>	mA
$I_{\text{GND}}$	Current out of a GND pin	-	130 <sup>(1)</sup>	mA
$V_{\text{PIN}}$	Pin voltage with respect to GND and $V_{\text{DD}}$	GND-0.6V	$V_{\text{DD}}+0.6\text{V}$	V
$T_{\text{storage}}$	Storage temp	-60	150	°C

Note: 1. Maximum source current is 46mA and maximum sink current is 65mA per cluster. A cluster is a group of GPIOs as shown in the following table. Also note that each  $V_{\text{DD}}$ /GND pair is connected to 2 clusters so current consumption through the pair will be a sum of the clusters source/sink currents.

**Table 33-2. GPIO Clusters**

PACKAGE	CLUSTER	GPIO														SUPPLIES PINS CONNECTED TO THE CLUSTER
64pins	1	PB31	PB30	PA31	PA30											VDDIN pin56/GND pin54
	2	PA28	PA27	PB23	PB22											VDDIN pin56/GND pin54 and VDDIO pin 48/GND pin47
	3	PA25	PA24	PA23	PA22	PA21	PA20	PB17	PB16	PA19	PA18	PA17	PA16			VDDIO pin 48/GND pin47 and VDDIO pin34/GND pin33

### 33.3. General Operating Ratings

The device must operate within the ratings listed in the table in order for all other electrical characteristics and typical characteristics of the device to be valid.

Table 33-3. General operating conditions

Symbol	Parameter	Min.	Typ.	Max.	Units
V <sub>DD</sub>	Power supply voltage	1.62 <sup>(1)</sup>	3.3	3.63	V
V <sub>DDANA</sub>	Analog supply voltage	1.62 <sup>(1)</sup>	3.3	3.63	V
T <sub>A</sub>	Temperature range	-40	25	85	°C
T <sub>J</sub>	Junction temperature	-	-	100	°C

Note: 1. With BOD33 disabled. If the BOD33 is enabled, check *BOD LEVEL* value Table 33-18.

Note: 2. In debugger cold-plugging mode, NVM erase operations are not protected by the BOD33 and BOD12. NVM erase operation at supply voltages below specified minimum can cause corruption of NVM areas that are mandatory for correct device behavior.

### 33.4. Supply Characteristics

The following characteristics are applicable to the operating temperature range: T<sub>A</sub> = -40°C to 85°C, unless otherwise specified and are valid for a junction temperature up to T<sub>J</sub> = 100°C.

Table 33-4. Supply Characteristics

Symbol	Conditions	Voltage		
		Min.	Max.	Units
V <sub>DDIO</sub> V <sub>DDIN</sub> V <sub>DDANA</sub>	Full Voltage Range	1.62	3.63	V

**Table 33-5. Supply Rise Rates**

Symbol	Parameter	Rise Rate	Units
		Max.	
$V_{DDIO}$	DC supply peripheral I/Os, internal regulator and analog supply voltage	0.1	V/ $\mu$ s

### 33.6. Power Consumption

The values in the *Current Consumption* table are measured values of power consumption under the following conditions, except where noted:

- Operating conditions
  - $V_{VDDIN} = 3.3\text{ V}$
- Wake up time from sleep mode is measured from the edge of the wakeup signal to the execution of the first instruction fetched in flash.
- Oscillators
  - XOSC (crystal oscillator) stopped
  - XOSC32K (32kHz crystal oscillator) running with external 32kHz crystal
  - DFLL48M using XOSC32K as reference and running at 48 MHz
- Clocks
  - DFLL48M used as main clock source, except otherwise specified.
  - CPU, AHB clocks undivided
  - APBA clock divided by 4
  - APBB and APBC bridges off

- The following AHB module clocks are running: NVMCTRL, APBA bridge
  - All other AHB clocks stopped
- The following peripheral clocks running: PM, SYSCTRL, RTC
  - All other peripheral clocks stopped
- I/Os are inactive with internal pull-up
- CPU is running on flash with 1 wait states
- NVMCTRL cache enabled
- BOD33 disabled

**Table 33-8. Current Consumption**

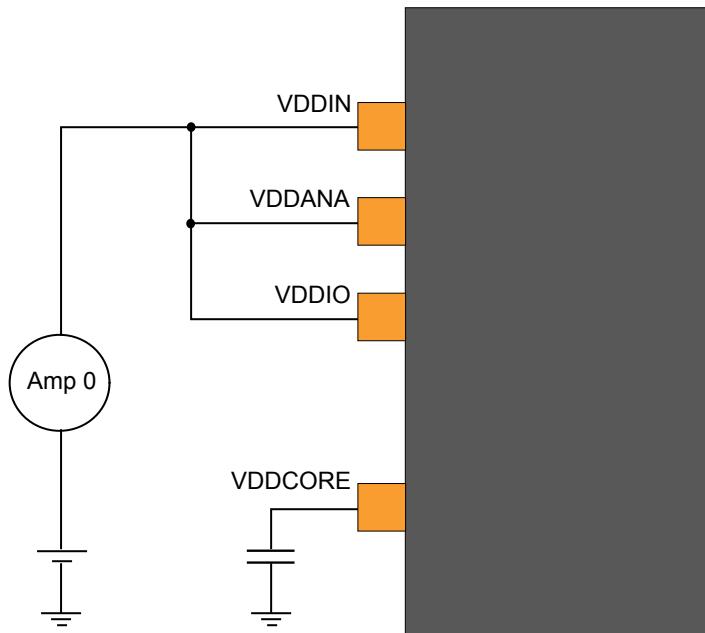

Mode	Conditions	T <sub>A</sub>	Min.	Typ.	Max.	Units
ACTIVE	CPU running a While(1) algorithm	25°C	2.13	2.33	2.52	mA
		85°C	2.24	2.44	2.63	
	CPU running a While(1) algorithm V <sub>DDIN</sub> =1.8V, CPU is running on Flash with 3 wait states	25°C	2.13	2.34	2.53

Figure 33-1. Measurement Schematic

### 33.7. Peripheral Power Consumption

Default conditions, except where noted:

- Operating conditions
  - $V_{VDDIN} = 3.3 \text{ V}$

- Oscillators
  - XOSC (crystal oscillator) stopped
  - XOSC32K (32 kHz crystal oscillator) running with external 32kHz crystal
  - OSC8M at 8MHz
- Clocks
  - OSC8M used as main clock source
  - CPU, AHB and APBn clocks undivided
- The following AHB module clocks are running: NVMCTRL, HPB2 bridge, HPB1 bridge, HPB0 bridge
  - All other AHB clocks stopped
- The following peripheral clocks running: PM, SYSCTRL
  - All other peripheral clocks stopped
- I/Os are inactive with internal pull-up
- CPU in IDLE0 mode
- Cache enabled
- BOD33 disabled

In this default conditions, the power consumption  $I_{\text{default}}$  is measured.

Operating mode for each peripheral in turn:

- Configure and enable the peripheral GCLK (When relevant, see conditions)
- Unmask the peripheral clock
- Enable the peripheral (when relevant)
- Set CPU in IDLE0 mode
- Measurement  $I_{\text{periph}}$
- Wake-up CPU via EIC (async: level detection, filtering disabled)
- Disable the peripheral (when relevant)
- Mask the peripheral clock
- Disable the peripheral GCLK (when relevant, see conditions)

Each peripheral power consumption provided in table x-9 is the value ( $I_{\text{periph}} - I_{\text{default}}$ ), using the same measurement method as for global power consumption measurement.

**Table 33-10. Typical Peripheral Power Consumption**

Peripheral	Conditions	Typ.	Units
RTC	$f_{\text{GCLK\_RTC}} = 32\text{kHz}$ , 32 bit counter mode	5.6	$\mu\text{A}$
WDT	$f_{\text{GCLK\_WDT}} = 32\text{kHz}$ , normal mode with EW	4.2	
AC	Both $f_{\text{GCLK}} = 8\text{MHz}$ , Enable both COMP	25.8	
TCx <sup>(1)</sup>	$f_{\text{GCLK}} = 8\text{MHz}$ , Enable + COUNTER in 8 bit mode	41.5	
SERCOMx.I2CM <sup>(2)</sup>	$f_{\text{GCLK}} = 8\text{MHz}$ , Enable	50.3	
SERCOMx.I2CS <sup>(2)</sup>	$f_{\text{GCLK}} = 8\text{MHz}$ , Enable	23.6	
SERCOMx.SPI <sup>(2)</sup>	$f_{\text{GCLK}} = 8\text{MHz}$ , Enable	47.9	
SERCOMx.USART <sup>(2)</sup>	$f_{\text{GCLK}} = 8\text{MHz}$ , Enable	47.6	

Notes: 1. All TCs share the same power consumption values.

2. All SERCOMs share the same power consumption values.

### 33.8. I/O Pin Characteristics

#### 33.8.1. Normal I/O Pins

Table 33-11. RevD and later normal I/O Pins Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$R_{PULL}$	Pull-up - Pull-down resistance		20	40	60	$k\Omega$
$V_{IL}$	Input low-level voltage	$V_{DD} = 1.62V-2.7V$	-	-	$0.25*V_{DD}$	V
		$V_{DD} = 2.7V-3.63V$	-	-	$0.3*V_{DD}$	
$V_{IH}$	Input high-level voltage	$V_{DD} = 1.62V-2.7V$	$0.7*V_{DD}$	-	-	
		$V_{DD} = 2.7V-3.63V$	$0.55*V_{DD}$	-	-	
$V_{OL}$	Output low-level voltage	$V_{DD} > 1.6V$ , $I_{OL}$ max	-	$0.1*V_{DD}$	$0.2*V_{DD}$	
$V_{OH}$	Output high-level voltage	$V_{DD} > 1.6V$ , $I_{OH}$ max	$0.8*V_{DD}$	$0.9*V_{DD}$	-	
$I_{OL}$	Output low-level current	$V_{DD} = 1.62V-3V$ , PORT.PINCFG.DRVSTR=0	-	-	1	mA
		$V_{DD} = 3V-3.63V$ , PORT.PINCFG.DRVSTR=0	-	-	2.5	
		$V_{DD} = 1.62V-3V$ , PORT.PINCFG.DRVSTR=1	-	-	3	
		$V_{DD} = 3V-3.63V$ , PORT.PINCFG.DRVSTR=1	-	-	10	
$I_{OH}$	Output high-level current	$V_{DD} = 1.62V-3V$ , PORT.PINCFG.DRVSTR=0	-	-	0.7	
		$V_{DD} = 3V-3.63V$ , PORT.PINCFG.DRVSTR=0	-	-	2	
		$V_{DD} = 1.62V-3V$ , PORT.PINCFG.DRVSTR=1	-	-	2	
		$V_{DD} = 3V-3.63V$ , PORT.PINCFG.DRVSTR=1	-	-	7	

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$t_{RISE}$	Rise time <sup>(1)</sup>	PORT.PINCFG.DRVSTR=0 load = 5pF, $V_{DD} = 3.3V$	-	-	15	ns
		PORT.PINCFG.DRVSTR=1 load = 20pF, $V_{DD} = 3.3V$	-	-	15	
$t_{FALL}$	Fall time <sup>(1)</sup>	PORT.PINCFG.DRVSTR=0 load = 5pF, $V_{DD} = 3.3V$	-	-	15	
		PORT.PINCFG.DRVSTR=1 load = 20pF, $V_{DD} = 3.3V$	-	-	15	
$I_{LEAK}$	Input leakage current	Pull-up resistors disabled	-1	+/-0.015	1	$\mu A$

Note: 1. These values are based on simulation. These values are not covered by test limits in production or characterization.

Table 33-12. SAMD20 revC/revB Normal I/O Pins Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$R_{PULL}$	Pull-up - Pull-down resistance		20	40	60	$k\Omega$
$V_{IL}$	Input low-level voltage	$V_{DD} = 1.62V-2.7V$	-	-	$0.25*V_{DD}$	V
		$V_{DD} = 2.7V-3.63V$	-	-	$0.3*V_{DD}$	
$V_{IH}$	Input high-level voltage	$V_{DD} = 1.62V-2.7V$	$0.7*V_{DD}$	-	-	
		$V_{DD} = 2.7V-3.63V$	$0.55*V_{DD}$	-	-	
$V_{OL}$	Output low-level voltage	$V_{DD} > 1.6V$ , $I_{OL}$ max	-	$0.1*V_{DD}$	$0.2*V_{DD}$	
$V_{OH}$	Output high-level voltage	$V_{DD} > 1.6V$ , $I_{OH}$ max	$0.8*V_{DD}$	$0.9*V_{DD}$	-	
$I_{OL}$	Output low-level current	$V_{DD} = 1.6V-3V$	-	-	8	mA
		$V_{DD} = 3V-3.63V$	-	-	20	
$I_{OH}$	Output high-level current	$V_{DD} = 1.6V-3V$	-	-	4.5	
		$V_{DD} = 3V-3.63V$	-	-	10	
$t_{RISE}$	Rise time <sup>(1)</sup>	load = 30pF, $V_{DD} = 3.3V$ , slope range [10%-90%]	-	7	-	ns
$t_{FALL}$	Fall time <sup>(1)</sup>		-	9.5	-	
$I_{LEAK}$	Input leakage current	Pull-up resistors disabled	-1	+/-0.015	1	$\mu A$

Note: 1. These values are based on simulation. These values are not covered by test limits in production or characterization.

### 33.8.2. I<sup>2</sup>C Pins

Refer to *I/O Multiplexing and Considerations* to get the list of I<sup>2</sup>C pins.

**Table 33-13. I<sup>2</sup>C Pins Characteristics in I<sup>2</sup>C configuration**

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
R <sub>PULL</sub>	Pull-up - Pull-down resistance		20	40	60	kΩ
V <sub>IL</sub>	Input low-level voltage	V <sub>DD</sub> = 1.62V-2.7V	-	-	0.25*V <sub>DD</sub>	V
		V <sub>DD</sub> = 2.7V-3.63V	-	-	0.3*V <sub>DD</sub>	
V <sub>IH</sub>	Input high-level voltage	V <sub>DD</sub> = 1.62V-2.7V	0.7*V <sub>DD</sub>	-	-	
		V <sub>DD</sub> = 2.7V-3.63V	0.55*V <sub>DD</sub>	-	-	
V <sub>HYS</sub>	Hysteresis of Schmitt trigger inputs		0.08*V <sub>DD</sub>	-	-	
V <sub>OL</sub>	Output low-level voltage	V <sub>DD</sub> > 2.0V I <sub>OL</sub> = 3mA	-	-	0.4	
		V <sub>DD</sub> ≤ 2.0V I <sub>OL</sub> = 2mA	-	-	0.2*V <sub>DD</sub>	
I <sub>OL</sub>	Output low-level current	V <sub>OL</sub> = 0.4V	3	-	-	mA
		V <sub>OL</sub> = 0.6V	6	-	-	
f <sub>SCL</sub>	SCL clock frequency		-	-	400	kHz

I<sup>2</sup>C pins timing characteristics can be found in [SERCOM in I<sup>2</sup>C Mode Timing](#)

#### Related Links

[I/O Multiplexing and Considerations](#) on page 27

#### 33.8.3. XOSC Pin

XOSC pins behave as normal pins when used as normal I/Os. Refer to [Table 33-11](#)

#### 33.8.4. XOSC32 Pin

XOSC32 pins behave as normal pins when used as normal I/Os. Refer to [Table 33-11](#).

#### 33.8.5. External Reset Pin

Reset pin has the same electrical characteristics as normal I/O pins. Refer to [Table 33-11](#).

### 33.9. Injection Current

Stresses beyond those listed in the table below may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Table 33-14. Injection Current<sup>(1)</sup>**

Symbol	Description	min	max	Unit
I <sub>inj1</sub> <sup>(2)</sup>	IO pin injection current	-1	+1	mA
I <sub>inj2</sub> <sup>(3)</sup>	IO pin injection current	-15	+15	mA
I <sub>injtotal</sub>	Sum of IO pins injection current	-45	+45	mA

**Note:**

1. Injecting current may have an effect on the accuracy of Analog blocks
2. Conditions for  $V_{pin}$ :  $V_{pin} < GND - 0.6V$  or  $3.6V < V_{pin} \leq 4.2V$ .

Conditions for  $V_{DD}$ :  $3V < V_{DD} \leq 3.6V$ .

If  $V_{pin}$  is lower than  $GND - 0.6V$ , then a current limiting resistor is required. The negative DC injection current limiting resistor  $R$  is calculated as  $R = |(GND - 0.6V - V_{pin})/I_{inj1}|$ .

If  $V_{pin}$  is greater than  $V_{DD} + 0.6V$ , a current limiting resistor is required. The positive DC injection current limiting resistor  $R$  is calculated as  $R = (V_{pin} - (V_{DD} + 0.6V))/I_{inj1}$ .

3. Conditions for  $V_{pin}$ :  $V_{pin} < GND - 0.6V$  or  $V_{pin} \leq 3.6V$ .

Conditions for  $V_{DD}$ :  $V_{DD} \leq 3V$ .

If  $V_{pin}$  is lower than  $GND - 0.6V$ , a current limiting resistor is required. The negative DC injection current limiting resistor  $R$  is calculated as  $R = |(GND - 0.6V - V_{pin})/I_{inj2}|$ .

If  $V_{pin}$  is greater than  $V_{DD} + 0.6V$ , a current limiting resistor is required. The positive DC injection current limiting resistor  $R$  is calculated as  $R = (V_{pin} - (V_{DD} + 0.6V))/I_{inj2}$ .

## 33.10. Analog Characteristics

### 33.10.1. Voltage Regulator Characteristics

Table 33-15. Voltage Regulator Electrical Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$V_{DDCORE}$	DC calibrated output voltage	Voltage regulator normal mode	1.1	1.23	1.30	V

Note: Supplying any external components using  $V_{DDCORE}$  pin is not allowed to assure the integrity of the core supply voltage.

Table 33-16. Decoupling requirements

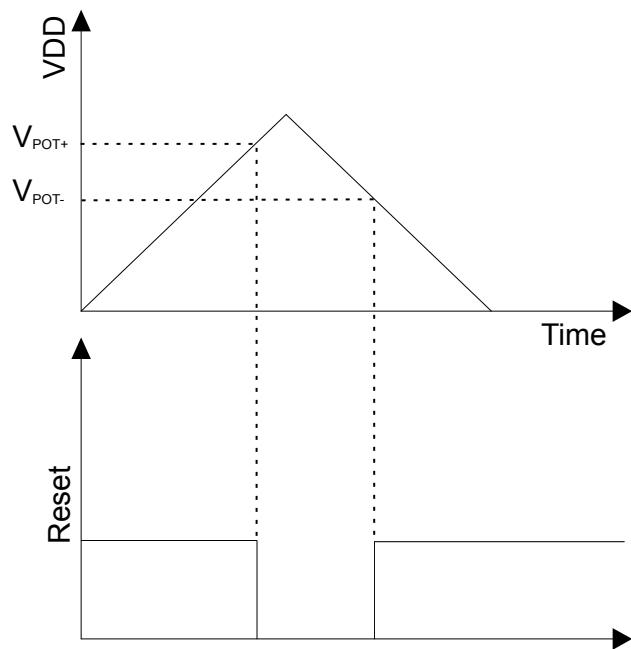

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$C_{IN}$	Input regulator capacitor, between $V_{DDIN}$ and GND		-	1	-	$\mu F$
$C_{OUT}$	Output regulator capacitor, between $V_{DDCORE}$ and GND		0.8	1	-	$\mu F$

### 33.10.2. Power-On Reset (POR) Characteristics

Table 33-17. POR Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$V_{POT+}$	Voltage threshold on $V_{DD}$ rising	$V_{DD}$ falls at 1V/ms or slower	1.27	1.45	1.58	V
$V_{POT-}$	Voltage threshold on $V_{DD}$ falling		0.72	0.99	1.32	V

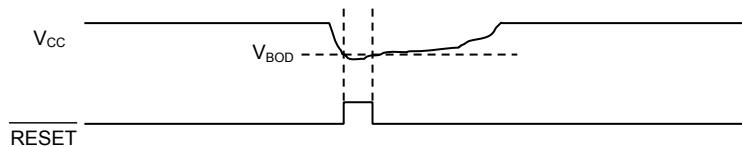

**Figure 33-2. POR Operating Principle**

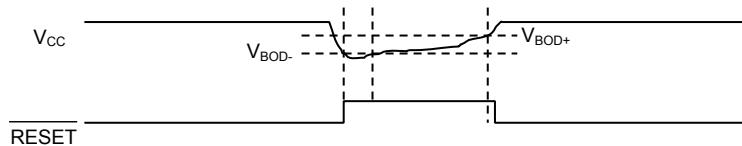

### 33.10.3. Brown-Out Detectors Characteristics

#### 33.10.3.1. BOD33

**Figure 33-3. BOD33 Hysteresis OFF**

**Figure 33-4. BOD33 Hysteresis ON**

**Table 33-18. BOD33 LEVEL Value**

Symbol	BOD33.LEVEL	Conditions	Min.	Typ.	Max.	Units
V <sub>BOD+</sub>	6	Hysteresis ON	-	1.715	1.745	V
	7		-	1.750	1.779	
	39		-	2.84	2.92	
	48		-	3.2	3.3	
V <sub>BOD-</sub> or V <sub>BOD</sub>	6	Hysteresis ON or Hysteresis OFF	1.62	1.64	1.67	
	7		1.64	1.675	1.71	
	39		2.72	2.77	2.81	
	48		3.0	3.07	3.2	

Note: See chapter Memories table *NVM User Row Mapping* for the BOD33 default value settings.

**Table 33-19. BOD33 Characteristics**

Symbol	Parameter	Conditions		Min.	Typ.	Max.	Units
	Step size, between adjacent values in BOD33.LEVEL			-	34	-	mV
V <sub>HYST</sub>	V <sub>BOD+</sub> - V <sub>BOD-</sub>	Hysteresis ON		35	-	170	mV
t <sub>DET</sub>	Detection time	Time with V <sub>DDANA</sub> < V <sub>TH</sub> necessary to generate a reset signal		-	0.9 <sup>(1)</sup>	-	μs
t <sub>STARTUP</sub>	Startup time		-40 to 85°C	-	2.2 <sup>(1)</sup>	-	μs
I <sub>IdleBOD33</sub>	Current consumption in Active/Idle Mode	Continuous mode	25°C		25	48	μA
			-40 to 85°C	-	50		
		Sampling mode	25°C		0.034	0.21	
			-40 to 85°C	-	1.62		
I <sub>SbyBOD33</sub>	Current Consumption in Standby mode	Sampling mode	25°C		0.132	0.38	μA
			-40 to 85°C	-	1		

Note: 1. These values are based on simulation. These values are not covered by test limits in production or characterization.

### 33.10.4. Analog-to-Digital (ADC) Characteristics

Table 33-20. Operating Conditions

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
RES	Resolution		8	-	12	bits
f <sub>CLK_ADC</sub>	ADC Clock frequency		30	-	2100	kHz
	Sample rate <sup>(1)</sup>	Single shot	5	-	300	ksps
		Free running	5	-	350 <sup>(3)</sup>	ksps
	Sampling time <sup>(1)</sup>		0.5	-	-	cycles
	Conversion time <sup>(1)</sup>	1x Gain	-	6	-	cycles
V <sub>REF</sub>	Voltage reference range		1.0	-	V <sub>DDANA</sub> -0.6	V
V <sub>REFINT1V</sub>	Internal 1V reference <sup>(2)</sup>		-	1.0	-	V
V <sub>REFINTVCC0</sub>	Internal ratiometric reference 0	-40°C to 85°C	-	V <sub>DDANA</sub> /1.48	-	V
V <sub>REFINTVCC0</sub> Voltage Error	Internal ratiometric reference 0 error <sup>(2)</sup>	-40°C to 85°C	-1.0	-	+1.0	%
V <sub>REFINTVCC1</sub>	Internal ratiometric reference 1	2.0V < V <sub>DDANA</sub> < 3.63V -40°C to 85°C	-	V <sub>DDANA</sub> /2	-	V
V <sub>REFINTVCC1</sub> Voltage Error	Internal ratiometric reference 1 error <sup>(2)</sup>	2.0V < V <sub>DDANA</sub> < 3.63V -40°C to 85°C	-1.0	-	+1.0	%
	Conversion range <sup>(1)</sup>	Differential mode	-V <sub>REF</sub> / GAIN	-	+V <sub>REF</sub> /GAIN	V
		Single-ended mode	0.0	-	+V <sub>REF</sub> /GAIN	V
C <sub>SAMPLE</sub>	Sampling capacitance <sup>(2)</sup>		-	3.5	-	pF
R <sub>SAMPLE</sub>	Input channel source resistance <sup>(2)</sup>		-	-	3.5	kΩ
I <sub>DD</sub>	DC supply current <sup>(1)</sup>	f <sub>CLK_ADC</sub> = 2.1MHz <sup>(3)</sup>	-	1.25	1.79	mA

- Notes:
1. These values are based on characterization. These values are not covered by test limits in production.
  2. These values are based on simulation. These values are not covered by test limits in production or characterization.
  3. In this condition and for a sample rate of 350ksps, a conversion takes 6 clock cycles of the ADC clock (conditions: 1X gain, 12-bit resolution, differential mode, free-running).

**Table 33-21. Differential Mode**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
ENOB	Effective Number Of Bits	With gain compensation	-	10.5	11.1	bits
TUE	Total Unadjusted Error	11x Gain	1.5	4.3	15.0	LSB
INL	Integral Non Linearity	1x Gain	1.0	1.3	4.5	LSB
DNL	Differential Non Linearity	1x Gain	+/-0.3	+/-0.5	+/-0.95	LSB
	Gain Error	Ext. Ref 1x	-10.0	2.5	+10.0	mV
		$V_{REF} = V_{DDANA}/1.48$	-15.0	-1.5	+10.0	mV
		$V_{REF} = INT1V$	-20.0	-5.0	+20.0	mV
	Gain Accuracy <sup>(5)</sup>	Ext. Ref. 0.5x	+/-0.1	+/-0.2	+/-0.45	%
		Ext. Ref. 2x to 16x	+/-0.05	+/-0.1	+/-0.11	%
	Offset Error	Ext. Ref. 1x	-5.0	-1.5	+5.0	mV
		$V_{REF} = V_{DDANA}/1.48$	-5.0	0.5	+5.0	mV
		$V_{REF} = INT1V$	-5.0	3.0	+5.0	mV
SFDR	Spurious Free Dynamic Range	1x Gain $F_{CLK\_ADC} = 2.1\text{MHz}$ $F_{IN} = 40\text{kHz}$ $A_{IN} = 95\%\text{FSR}$	62.7	70.0	75.0	dB
SINAD	Signal-to-Noise and Distortion		54.1	65.0	68.5	dB
SNR	Signal-to-Noise Ratio		54.5	65.5	68.6	dB
THD	Total Harmonic Distortion		-77.0	-64.0	-63.0	dB
	Noise RMS	T=25°C	0.6	1.0	1.6	mV

**Note:** Maximum numbers are based on characterization and not tested in production, and valid for 5% to 95% of the input voltage range.

**Note:** Dynamic parameter numbers are based on characterization and not tested in production.

**Note:** Respect the input common mode voltage through the following equations (where  $V_{CM\_IN}$  is the Input channel common mode voltage):

a. If  $|V_{IN}| > V_{REF}/4$

- $V_{CM\_IN} < 0.95*V_{DDANA} + V_{REF}/4 - 0.75V$
- $V_{CM\_IN} > V_{REF}/4 - 0.05*V_{DDANA} - 0.1V$

b. If  $|V_{IN}| < V_{REF}/4$

- $V_{CM\_IN} < 1.2*V_{DDANA} - 0.75V$
- $V_{CM\_IN} > 0.2*V_{DDANA} - 0.1V$

**Note:** The ADC channels on pins PA08, PA09, PA10, PA11 are powered from the VDDIO power supply. The ADC performance of these pins will not be the same as all the other ADC channels on pins powered from the VDDANA power supply.

**Note:** The gain accuracy represents the gain error expressed in percent. Gain accuracy (%) =  $(\text{Gain Error in V} \times 100) / (2*V_{REF}/GAIN)$

**Table 33-22. Single-Ended Mode**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
ENOB	Effective Number of Bits	With gain compensation	-	9.5	9.8	Bits
TUE	Total Unadjusted Error	1x gain	-	10.5	14.0	LSB
INL	Integral Non-Linearity	1x gain	1.0	1.6	3.5	LSB
DNL	Differential Non-Linearity	1x gain	+/-0.5	+/-0.6	+/-0.95	LSB
	Gain Error	Ext. Ref. 1x	-5.0	0.7	+5.0	mV
	Gain Accuracy <sup>(4)</sup>	Ext. Ref. 0.5x	+/-0.2	+/-0.34	+/-0.4	%
		Ext. Ref. 2x to 16X	+/-0.01	+/-0.1	+/-0.2	%
	Offset Error	Ext. Ref. 1x	-5.0	1.5	+5.0	mV
SFDR	Spurious Free Dynamic Range	1x Gain $F_{CLK\_ADC} = 2.1\text{MHz}$ $F_{IN} = 40\text{kHz}$ $A_{IN} = 95\%\text{FSR}$	63.1	65.0	67.0	dB
SINAD	Signal-to-Noise and Distortion		47.5	59.5	61.0	dB
SNR	Signal-to-Noise Ratio		48.0	60.0	64.0	dB
THD	Total Harmonic Distortion		-65.4	-63.0	-62.1	dB
	Noise RMS	$T = 25^\circ\text{C}$	-	1.0	-	mV

**Note:** Maximum numbers are based on characterization and not tested in production, and for 5% to 95% of the input voltage range.

**Note:** Respect the input common mode voltage through the following equations (where  $V_{CM\_IN}$  is the Input channel common mode voltage) for all  $V_{IN}$ :

- $V_{CM\_IN} < 0.7*V_{DDANA} + V_{REF}/4 - 0.75\text{V}$
- $V_{CM\_IN} > V_{REF}/4 - 0.3*V_{DDANA} - 0.1\text{V}$

**Note:** The ADC channels on pins PA08, PA09, PA10, PA11 are powered from the VDDIO power supply. The ADC performance of these pins will not be the same as all the other ADC channels on pins powered from the VDDANA power supply.

**Note:** The gain accuracy represents the gain error expressed in percent. Gain accuracy (%) = (Gain Error in V x 100) / ( $V_{REF}/GAIN$ )

#### 33.10.4.1. Performance with the Averaging Digital Feature

Averaging is a feature which increases the sample accuracy. ADC automatically computes an average value of multiple consecutive conversions. The numbers of samples to be averaged is specified by the Number-of-Samples-to-be-collected bit group in the Average Control register (AVGCTRL.SAMPLENUM[3:0]) and the averaged output is available in the Result register (RESULT).

**Table 33-23. Averaging feature**

Average Number	Conditions	SNR (dB)	SINAD (dB)	SFDR (dB)	ENOB (bits)
1	In differential mode, 1x gain, $V_{DDANA}=3.0\text{V}$ , $V_{REF}=1.0\text{V}$ , 350ksps $T= 25^\circ\text{C}$	66.0	65.0	72.8	9.75
8		67.6	65.8	75.1	10.62
32		69.7	67.1	75.3	10.85
128		70.4	67.5	75.5	10.91

### 33.10.4.2. Performance with the hardware offset and gain correction

Inherent gain and offset errors affect the absolute accuracy of the ADC. The offset error cancellation is handled by the Offset Correction register (OFFSETCORR) and the gain error cancellation, by the Gain Correction register (GAINCORR). The offset and gain correction value is subtracted from the converted data before writing the Result register (RESULT).

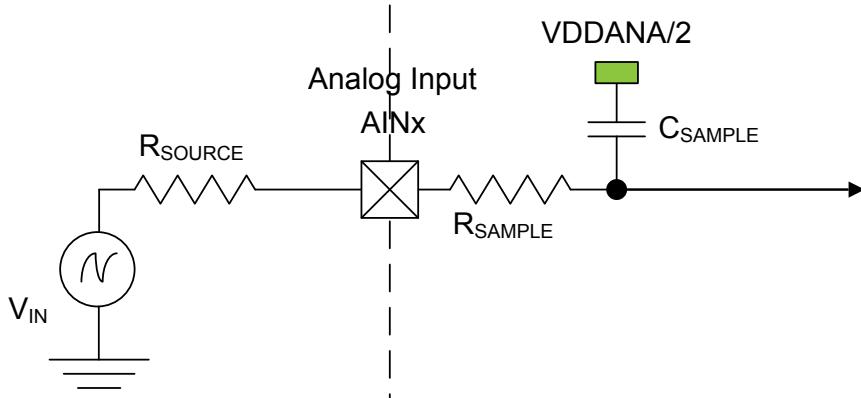

Table 33-24. Offset and Gain correction feature

Gain Factor	Conditions	Offset Error (mV)	Gain Error (mV)	Total Unadjusted Error (LSB)
0.5x	In differential mode, 1x gain, $V_{DDANA}=3.0V$ , $V_{REF}=1.0V$ , 350ksps $T= 25^{\circ}C$	0.25	1.0	2.4
1x		0.20	0.10	1.5
2x		0.15	-0.15	2.7
8x		-0.05	0.05	3.2
16x		0.10	-0.05	6.1

### 33.10.4.3. Inputs and Sample and Hold Acquisition Times

The analog voltage source must be able to charge the sample and hold (S/H) capacitor in the ADC in order to achieve maximum accuracy. Seen externally the ADC input consists of a resistor ( $R_{SAMPLE}$ ) and a capacitor ( $C_{SAMPLE}$ ). In addition, the source resistance ( $R_{SOURCE}$ ) must be taken into account when calculating the required sample and hold time. The figure below shows the ADC input channel equivalent circuit.

Figure 33-5. ADC Input

To achieve  $n$  bits of accuracy, the  $C_{SAMPLE}$  capacitor must be charged at least to a voltage of

$$V_{CSAMPLE} \geq V_{IN} \times \left(1 - 2^{-(n+1)}\right)$$

The minimum sampling time  $t_{SAMPLEHOLD}$  for a given  $R_{SOURCE}$  can be found using this formula:

$$t_{SAMPLEHOLD} \geq (R_{SAMPLE} + R_{SOURCE}) \times (C_{SAMPLE}) \times (n + 1) \times \ln(2)$$

for a 12 bits accuracy:  $t_{SAMPLEHOLD} \geq (R_{SAMPLE} + R_{SOURCE}) \times (C_{SAMPLE}) \times 9.02$

where

$$t_{SAMPLEHOLD} = \frac{1}{2 \times f_{ADC}}$$

### 33.10.5. Digital to Analog Converter (DAC) Characteristics

Table 33-25. Operating Conditions<sup>(1)</sup>

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$V_{DDANA}$	Analog supply voltage		1.62	-	3.63	V
$AV_{REF}$	External reference voltage		1.0	-	$V_{DDANA}-0.6$	V
	Internal reference voltage 1		-	1	-	V
	Internal reference voltage 2		-	$V_{DDANA}$	-	V
	Linear output voltage range		0.05	-	$V_{DDANA}-0.05$	V
	Minimum resistive load		5	-	-	kΩ
	Maximum capacitance load		-	-	100	pF
$I_{DD}$	DC supply current <sup>(2)</sup>	Voltage pump disabled	-	160	230	μA

Notes: 1. These values are based on specifications otherwise noted.

2. These values are based on characterization. These values are not covered by test limits in production.

Table 33-26. Clock and Timing<sup>(1)</sup>

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
	Conversion rate	$C_{load} = 100\text{pF}$	Normal mode	-	350	ksps
		$R_{load} > 5\text{kΩ}$				
	Startup time	$V_{DDANA} > 2.6\text{V}$	-	-	2.85	μs
		$V_{DDANA} < 2.6\text{V}$				

Note: 1. These values are based on simulation. These values are not covered by test limits in production or characterization.

Table 33-27. Accuracy Characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units	
RES	Input resolution		-	-	10	Bits	
INL	Integral non-linearity	$V_{REF} = \text{Ext } 1.0\text{V}$	$V_{DD} = 1.6\text{V}$	0.75	1.1	2.5	LSB
			$V_{DD} = 3.6\text{V}$	0.6	1.2	1.5	
		$V_{REF} = V_{DDANA}$	$V_{DD} = 1.6\text{V}$	1.4	2.2	2.5	
			$V_{DD} = 3.6\text{V}$	0.9	1.4	1.5	
		$V_{REF} = \text{INT1V}$	$V_{DD} = 1.6\text{V}$	0.75	1.3	1.5	
			$V_{DD} = 3.6\text{V}$	0.8	1.2	1.5	

Symbol	Parameter	Conditions		Min.	Typ.	Max.	Units
DNL	Differential non-linearity	$V_{REF} = \text{Ext } 1.0V$	$V_{DD} = 1.6V$	+/-0.9	+/-1.2	+/-1.5	LSB
			$V_{DD} = 3.6V$	+/-0.9	+/-1.1	+/-1.2	
		$V_{REF} = V_{DDANA}$	$V_{DD} = 1.6V$	+/-1.1	+/-1.5	+/-1.7	
			$V_{DD} = 3.6V$	+/-1.0	+/-1.1	+/-1.2	
		$V_{REF} = \text{INT1V}$	$V_{DD} = 1.6V$	+/-1.1	+/-1.4	+/-1.5	
			$V_{DD} = 3.6V$	+/-1.0	+/-1.5	+/-1.6	
	Gain error	Ext. $V_{REF}$		+/-1.5	+/-5	+/-10	mV
	Offset error	Ext. $V_{REF}$		+/-2	+/-3	+/-6	mV

Note: 1. All values measured using a conversion rate of 350ksps.

### 33.10.6. Analog Comparator Characteristics

Table 33-28. Electrical and Timing

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
	Positive input voltage range		0	-	$V_{DDANA}$	V
	Negative input voltage range		0	-	$V_{DDANA}$	
	Offset	Hysteresis = 0, Fast mode	-15	0.0	+15	mV
		Hysteresis = 0, Low power mode	-25	0.0	+25	mV
	Hysteresis	Hysteresis = 1, Fast mode	20	50	80	mV
		Hysteresis = 1, Low power mode	15	40	75	mV
	Propagation delay	Changes for $V_{ACM} = V_{DDANA}/2$ 100mV overdrive, Fast mode	-	60	116	ns
		Changes for $V_{ACM} = V_{DDANA}/2$ 100mV overdrive, Low power mode	-	225	370	ns
$t_{STARTUP}$	Startup time	Enable to ready delay Fast mode	-	1	2	μs
		Enable to ready delay Low power mode	-	12	19	μs
$V_{SCALE}$	INL <sup>(3)</sup>		-1.4	0.75	+1.4	LSB
	DNL <sup>(3)</sup>		-0.9	0.25	+0.9	LSB
	Offset Error <sup>(1)(2)</sup>		-0.200	0.260	+0.920	LSB
	Gain Error <sup>(1)(2)</sup>		-0.89	0.215	0.89	LSB

Notes: 1. According to the standard equation  $V(X) = V_{LSB} * (X+1)$ ;  $V_{LSB} = V_{DDANA}/64$

2. Data computed with the Best Fit method

3. Data computed using histogram

### 33.10.7. Bandgap Reference Characteristics

Table 33-29. Bandgap (Internal 1.1V reference) characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
INTBG	Bandgap reference	Over voltage and [-40°C, +85°C]	1.08	1.1	1.12	V
		Over voltage at 25°C	1.09	1.1	1.11	

### 33.10.8. Temperature Sensor Characteristics

#### 33.10.8.1. Temperature Sensor Characteristics

Table 33-30. Temperature Sensor Characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
	Temperature sensor output voltage	T= 25°C, V <sub>DDANA</sub> = 3.3V	-	0.667	-	V
	Temperature sensor slope		2.3	2.4	2.5	mV/°C
	Variation over V <sub>DDANA</sub> voltage	V <sub>DDANA</sub> = 1.62V to 3.6V	-1.7	1	3.7	mV/V
	Temperature Sensor accuracy	Using the method described in the following section	-10	-	10	°C

Note: 1. These values are based on characterization. These values are not covered by test limits in production.

2. See also rev C errata concerning the temperature sensor.

#### 33.10.8.2. Software-based Refinement of the Actual Temperature

The temperature sensor behavior is linear but it depends on several parameters such as the internal voltage reference which itself depends on the temperature. To take this into account, each device contains a Temperature Log row with data measured and written during the production tests. These calibration values should be read by software to infer the most accurate temperature readings possible.

This Software Temperature Log row can be read at address 0x00806030. The Software Temperature Log row cannot be written.

This section specifies the Temperature Log row content and explains how to refine the temperature sensor output using the values in the Temperature Log row.

##### Temperature Log Row

All values in this row were measured in the following conditions:

- V<sub>DDIN</sub> = V<sub>DDIO</sub> = V<sub>DDANA</sub> = 3.3V
- ADC Clock speed = 1MHz
- ADC mode: Free running mode, ADC averaging mode with 4 averaged samples
- ADC voltage reference = 1.0V internal reference (INT1V)
- ADC input = Temperature sensor

**Table 33-31. Temperature Log Row Content**

Bit position	Name	Description
7:0	ROOM_TEMP_VAL_INT	Integer part of room temperature in °C
11:8	ROOM_TEMP_VAL_DEC	Decimal part of room temperature
19:12	HOT_TEMP_VAL_INT	Integer part of hot temperature in °C
23:20	HOT_TEMP_VAL_DEC	Decimal part of hot temperature
31:24	ROOM_INT1V_VAL	2's complement of the internal 1V reference drift at room temperature (versus a 1.0 centered value)
39:32	HOT_INT1V_VAL	2's complement of the internal 1V reference drift at hot temperature (versus a 1.0 centered value)
51:40	ROOM_ADC_VAL	12-bit ADC conversion at room temperature
63:52	HOT_ADC_VAL	12-bit ADC conversion at hot temperature

The temperature sensor values are logged during test production flow for Room and Hot insertions:

- ROOM\_TEMP\_VAL\_INT and ROOM\_TEMP\_VAL\_DEC contains the measured temperature at room insertion (e.g. for ROOM\_TEMP\_VAL\_INT=25 and ROOM\_TEMP\_VAL\_DEC=2, the measured temperature at room insertion is 25.2°C).
- HOT\_TEMP\_VAL\_INT and HOT\_TEMP\_VAL\_DEC contains the measured temperature at hot insertion (e.g. for HOT\_TEMP\_VAL\_INT=83 and HOT\_TEMP\_VAL\_DEC=3, the measured temperature at room insertion is 83.3°C).

The temperature log row also contains the corresponding 12-bit ADC conversions of both Room and Hot temperatures:

- ROOM\_ADC\_VAL contains the 12-bit ADC value corresponding to (ROOM\_TEMP\_VAL\_INT, ROOM\_TEMP\_VAL\_DEC)
- HOT\_ADC\_VAL contains the 12-bit ADC value corresponding to (HOT\_TEMP\_VAL\_INT, HOT\_TEMP\_VAL\_DEC)

The temperature log row also contains the corresponding 1V internal reference of both Room and Hot temperatures:

- ROOM\_INT1V\_VAL is the 2's complement of the internal 1V reference value corresponding to (ROOM\_TEMP\_VAL\_INT, ROOM\_TEMP\_VAL\_DEC)
- HOT\_INT1V\_VAL is the 2's complement of the internal 1V reference value corresponding to (HOT\_TEMP\_VAL\_INT, HOT\_TEMP\_VAL\_DEC)
- ROOM\_INT1V\_VAL and HOT\_INT1V\_VAL values are centered around 1V with a 0.001V step. In other words, the range of values [0,127] corresponds to [1V, 0.873V] and the range of values [-1, -127] corresponds to [1.001V, 1.127V]. INT1V == 1 - (VAL/1000) is valid for both ranges.

### Using Linear Interpolation

For concise equations, we'll use the following notations:

- (ROOM\_TEMP\_VAL\_INT, ROOM\_TEMP\_VAL\_DEC) is denoted  $\text{temp}_R$
- (HOT\_TEMP\_VAL\_INT, HOT\_TEMP\_VAL\_DEC) is denoted  $\text{temp}_H$
- ROOM\_ADC\_VAL is denoted  $\text{ADC}_R$ , its conversion to Volt is denoted  $V_{\text{ADCR}}$
- HOT\_ADC\_VAL is denoted  $\text{ADC}_H$ , its conversion to Volt is denoted  $V_{\text{ADCH}}$
- ROOM\_INT1V\_VAL is denoted  $\text{INT1V}_R$

- HOT\_INT1V\_VAL is denoted INT1V<sub>H</sub>

Using the (temp<sub>R</sub>, ADC<sub>R</sub>) and (temp<sub>H</sub>, ADC<sub>H</sub>) points, using a linear interpolation we have the following equation:

$$\left( \frac{V_{ADC} - V_{ADCR}}{\text{temp} - \text{temp}_R} \right) = \left( \frac{V_{ADCH} - V_{ADCR}}{\text{temp}_H - \text{temp}_R} \right)$$

Given a temperature sensor ADC conversion value ADC<sub>m</sub>, we can infer a coarse value of the temperature temp<sub>C</sub> as:

[Equation 1]

$$\text{temp}_C = \text{temp}_R + \left[ \frac{\left( \left( \text{ADC}_m \cdot \frac{1}{(2^{12}-1)} \right) - \left( \text{ADC}_R \cdot \frac{\text{INT1V}_R}{(2^{12}-1)} \right) \right) \cdot (\text{temp}_H - \text{temp}_R)}{\left( \left( \text{ADC}_H \cdot \frac{\text{INT1V}_H}{(2^{12}-1)} \right) - \left( \text{ADC}_R \cdot \frac{\text{INT1V}_R}{(2^{12}-1)} \right) \right)} \right]$$

Note 1: in the previous expression, we've added the conversion of the ADC register value to be expressed in V

Note 2: this is a coarse value because we assume INT1V=1V for this ADC conversion.

Using the (temp<sub>R</sub>, INT1V<sub>R</sub>) and (temp<sub>H</sub>, INT1V<sub>H</sub>) points, using a linear interpolation we have the following equation:

$$\left( \frac{\text{INT1V} - \text{INT1V}_R}{\text{temp} - \text{temp}_R} \right) = \left( \frac{\text{INT1V}_H - \text{INT1V}_R}{\text{temp}_H - \text{temp}_R} \right)$$

Then using the coarse temperature value, we can infer a closer to reality INT1V value during the ADC conversion as:

$$\text{INT1V}_m = \text{INT1V}_R + \left( \frac{(\text{INT1V}_H - \text{INT1V}_R) \cdot (\text{temp}_C - \text{temp}_R)}{(\text{temp}_H - \text{temp}_R)} \right)$$

Back to [Equation 1], we replace INT1V=1V by INT1V = INT1V<sub>m</sub>, we can then deduce a finer temperature value as:

[Equation 1bis]

$$\text{temp}_f = \text{temp}_R + \left[ \frac{\left( \left( \text{ADC}_m \cdot \frac{\text{INT1V}_m}{(2^{12}-1)} \right) - \left( \text{ADC}_R \cdot \frac{\text{INT1V}_R}{(2^{12}-1)} \right) \right) \cdot (\text{temp}_H - \text{temp}_R)}{\left( \left( \text{ADC}_H \cdot \frac{\text{INT1V}_H}{(2^{12}-1)} \right) - \left( \text{ADC}_R \cdot \frac{\text{INT1V}_R}{(2^{12}-1)} \right) \right)} \right]$$

### 33.11. NVM Characteristics

Table 33-32. Maximum Operating Frequency

V <sub>DD</sub> range	NVM Wait States	Maximum Operating Frequency	Units
1.62V to 2.7V	0	14	MHz
	1	28	
	2	42	
	3	48	
2.7V to 3.63V	0	24	
	1	48	

Note that on this flash technology, a max number of 8 consecutive write is allowed per row. Once this number is reached, a row erase is mandatory.

Table 33-33. Flash Endurance and Data Retention

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
Ret <sub>NVM25k</sub>	Retention after up to 25k	Average ambient 55°C	10	50	-	Years
Ret <sub>NVM2.5k</sub>	Retention after up to 2.5k	Average ambient 55°C	20	100	-	Years
Ret <sub>NVM100</sub>	Retention after up to 100	Average ambient 55°C	25	>100	-	Years
Cyc <sub>NVM</sub>	Cycling Endurance <sup>(1)</sup>	-40°C < Ta < 85°C	25k	150k	-	Cycles

Note: 1. An endurance cycle is a write and an erase operation.

Table 33-34. EEPROM Emulation<sup>(1)</sup> Endurance and Data Retention

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
Ret <sub>EEPROM100k</sub>	Retention after up to 100k	Average ambient 55°C	10	50	-	Years
Ret <sub>EEPROM10k</sub>	Retention after up to 10k	Average ambient 55°C	20	100	-	Years
Cyc <sub>EEPROM</sub>	Cycling Endurance <sup>(2)</sup>	-40°C < Ta < 85°C	100k	600k	-	Cycles

Notes: 1. The EEPROM emulation is a software emulation described in the App note AT03265.

2. An endurance cycle is a write and an erase operation.

Table 33-35. NVM Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
t <sub>FPP</sub>	Page programming time	-	-	-	2.5	ms
t <sub>FRE</sub>	Row erase time	-	-	-	6	ms
t <sub>FCE</sub>	DSU chip erase time (CHIP_ERASE)	-	-	-	240	ms

## 33.12. Oscillators Characteristics

### 33.12.1. Crystal Oscillator (XOSC) Characteristics

#### 33.12.1.1. Digital Clock Characteristics

The following table describes the characteristics for the oscillator when a digital clock is applied on XIN.

**Table 33-36. Digital Clock Characteristics**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$f_{CPXIN}$	XIN clock frequency		-	-	32	MHz

#### 33.12.1.2. Crystal Oscillator Characteristics

The following table describes the characteristics for the oscillator when a crystal is connected between XIN and XOUT as shown in the figure *Oscillator Connection*. The user must choose a crystal oscillator where the crystal load capacitance  $C_L$  is within the range given in the table. The exact value of  $C_L$  can be found in the crystal datasheet. The capacitance of the external capacitors ( $C_{LEXT}$ ) can then be computed as follows:

$$C_{LEXT} = 2(C_L - C_{STRAY} - C_{SHUNT})$$

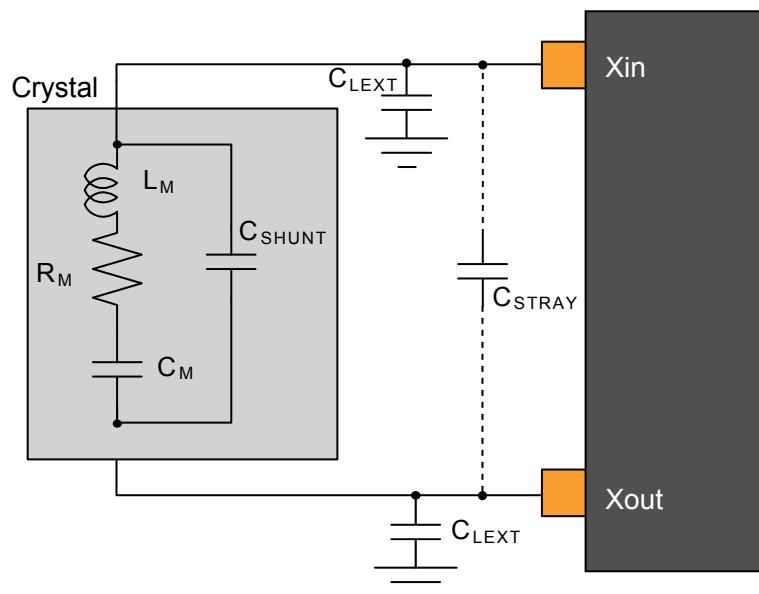

where  $C_{STRAY}$  is the capacitance of the pins and PCB,  $C_{SHUNT}$  is the shunt capacitance of the crystal.

**Table 33-37. Crystal Oscillator Characteristics**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$f_{OUT}$	Crystal oscillator frequency		0.4	-	32	MHz
ESR	Crystal Equivalent Series Resistance Safety Factor = 3  The AGC doesn't have any noticeable impact on these measurements.	$f = 0.455 \text{ MHz}, C_L = 100\text{pF}$ XOSC.GAIN = 0	-	-	5.6K	$\Omega$
		$f = 2\text{MHz}, C_L = 20\text{pF}$ XOSC.GAIN = 0	-	-	416	
		$f = 4\text{MHz}, C_L = 20\text{pF}$ XOSC.GAIN = 1	-	-	243	
		$f = 8\text{ MHz}, C_L = 20\text{pF}$ XOSC.GAIN = 2	-	-	138	
		$f = 16\text{ MHz}, C_L = 20\text{pF}$ XOSC.GAIN = 3	-	-	66	
		$f = 32\text{MHz}, C_L = 18\text{pF}$ XOSC.GAIN = 4	-	-	56	
$C_{XIN}$	Parasitic capacitor load		-	5.9	-	pF
$C_{XOUT}$	Parasitic capacitor load		-	3.2	-	pF

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
	Current Consumption	$f = 2\text{MHz}, C_L = 20\text{pF}, \text{AGC off}$	27	65	85	$\mu\text{A}$
		$f = 2\text{MHz}, C_L = 20\text{pF}, \text{AGC on}$	14	52	73	
		$f = 4\text{MHz}, C_L = 20\text{pF}, \text{AGC off}$	61	117	150	
		$f = 4\text{MHz}, C_L = 20\text{pF}, \text{AGC on}$	23	74	100	
		$f = 8\text{MHz}, C_L = 20\text{pF}, \text{AGC off}$	131	226	296	
		$f = 8\text{MHz}, C_L = 20\text{pF}, \text{AGC on}$	56	128	172	
		$f = 16\text{MHz}, C_L = 20\text{pF}, \text{AGC off}$	305	502	687	
		$f = 16\text{MHz}, C_L = 20\text{pF}, \text{AGC on}$	116	307	552	
		$f = 32\text{MHz}, C_L = 18\text{pF}, \text{AGC off}$	1031	1622	2200	
		$f = 32\text{MHz}, C_L = 18\text{pF}, \text{AGC on}$	278	615	1200	
$t_{\text{STARTUP}}$	Startup time	$f = 2\text{MHz}, C_L = 20\text{pF}, \text{XOSC.GAIN} = 0, \text{ESR} = 600\Omega$	-	14K	48K	cycles
		$f = 4\text{MHz}, C_L = 20\text{pF}, \text{XOSC.GAIN} = 1, \text{ESR} = 100\Omega$	-	6800	19.5K	
		$f = 8\text{MHz}, C_L = 20\text{pF}, \text{XOSC.GAIN} = 2, \text{ESR} = 35\Omega$	-	5550	13K	
		$f = 16\text{MHz}, C_L = 20\text{pF}, \text{XOSC.GAIN} = 3, \text{ESR} = 25\Omega$	-	6750	14.5K	
		$f = 32\text{MHz}, C_L = 18\text{pF}, \text{XOSC.GAIN} = 4, \text{ESR} = 40\Omega$	-	5.3K	9.6K	

Figure 33-6. Oscillator Connection

### 33.12.2. External 32 kHz Crystal Oscillator (XOSC32K) Characteristics

#### 33.12.2.1. Digital Clock Characteristics

The following table describes the characteristics for the oscillator when a digital clock is applied on XIN32 pin.

**Table 33-38. Digital Clock Characteristics**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$f_{CPXIN32}$	XIN32 clock frequency		-	32.768	-	kHz
	XIN32 clock duty cycle		-	50	-	%

#### 33.12.2.2. Crystal Oscillator Characteristics

Figure 33-6 and the equation in [Crystal Oscillator Characteristics](#) also apply to the 32 kHz oscillator connection. The user must choose a crystal oscillator where the crystal load capacitance  $C_L$  is within the range given in the table. The exact value of  $C_L$  can be found in the crystal datasheet.

**Table 33-39. 32kHz Crystal Oscillator Characteristics**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$f_{OUT}$	Crystal oscillator frequency		-	32768	-	Hz
$t_{STARTUP}$	Startup time	$ESR_{XTAL} = 39.9 \text{ k}\Omega, C_L = 12.5 \text{ pF}$	-	28K	30K	cycles
$C_L$	Crystal load capacitance		-	-	12.5	pF
$C_{SHUNT}$	Crystal shunt capacitance		-	0.1	-	
$C_{XIN32}$	Parasitic capacitor load		-	3.1	-	
$C_{XOUT32}$	Parasitic capacitor load		-	3.3	-	
$I_{XOSC32K}$	Current consumption	AGC off	-	1.22	2.19	$\mu\text{A}$
		AGC on <sup>(1)(2)</sup>	-	-	-	
ESR	Crystal equivalent series resistance $f=32.768\text{kHz}$ Safety Factor = 3	$C_L=12.5\text{pF}$	-	-	141	k $\Omega$

Note: 1. See revD/revC/revB errata concerning the XOSC32K.

### 33.12.3. Digital Frequency Locked Loop (DFLL48M) Characteristics

**Table 33-40. DFLL48M Characteristics - Closed Loop Mode<sup>(1)(2)</sup>**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$f_{OUT}$	Average Output frequency	$f_{REF} = 32.768\text{kHz}$	47	48	49	MHz
$f_{REF}$	Reference frequency		0.732	32.768	35.1	kHz
Jitter	Period jitter	$f_{REF} = 32.768\text{kHz}$	-	-	0.42	ns
$I_{DFLL}$	Power consumption on $V_{DDIN}$	$f_{REF} = 32.768\text{kHz}$ . For SAMD20 revC devices	-	397	-	$\mu\text{A}$
		$f_{REF} = 32.768\text{kHz}$ . For SAMD20 revD and later.	-	292	-	

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units

### 33.14.3. SERCOM in I<sup>2</sup>C Mode Timing

The following table describes the requirements for devices connected to the I<sup>2</sup>C Interface Bus. Timing symbols refer to the figure below.

**Figure 33-16. I<sup>2</sup>C Interface Bus Timing**

**Table 33-46. I<sup>2</sup>C Interface Timing<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
t <sub>R</sub>	Rise time for both SDA and SCL <sup>(3)</sup>		-	-	300	ns
t <sub>OF</sub>	Output fall time from V <sub>IHmin</sub> to V <sub>ILmax</sub> <sup>(3)</sup>	10pF < C <sub>b</sub> <sup>(2)</sup> < 400pF	7.0	10.0	50.0	
t <sub>HD;STA</sub>	Hold time (repeated) START condition	f <sub>SCL</sub> > 100kHz, Master	t <sub>LOW</sub> -9	-	-	
t <sub>LOW</sub>	Low period of SCL Clock	f <sub>SCL</sub> > 100kHz	113	-	-	
t <sub>BUF</sub>	Bus free time between a STOP and a START condition	f <sub>SCL</sub> > 100kHz	t <sub>LOW</sub>	-	-	
t <sub>SU;STA</sub>	Setup time for a repeated START condition	f <sub>SCL</sub> > 100kHz, Master	t <sub>LOW</sub> +7	-	-	
t <sub>HD;DAT</sub>	Data hold time	f <sub>SCL</sub> > 100kHz, Master	9	-	12	
t <sub>SU;DAT</sub>	Data setup time	f <sub>SCL</sub> > 100kHz, Master	104	-	-	
t <sub>SU;STO</sub>	Setup time for STOP condition	f <sub>SCL</sub> > 100kHz, Master	t <sub>LOW</sub> +9	-	-	
t <sub>SU;DAT;rx</sub>	Data setup time (receive mode)	f <sub>SCL</sub> > 100kHz, Slave	51	-	56	
t <sub>HD;DAT;tx</sub>	Data hold time (send mode)	f <sub>SCL</sub> > 100kHz, Slave	71	90	138	

Notes: 1. These values are based on simulation. These values are not covered by test limits in production.

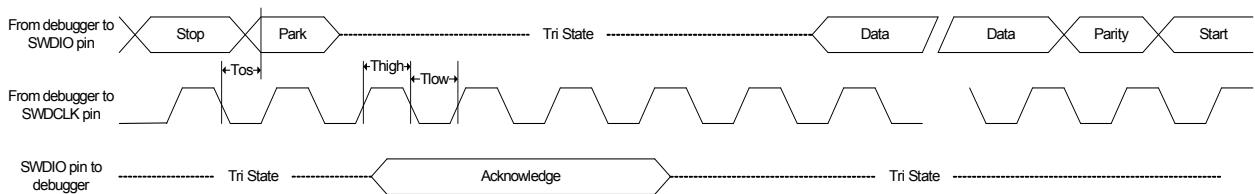

2. C<sub>b</sub> = Capacitive load on each bus line. Otherwise noted, value of C<sub>b</sub> set to 20pF.

3. These values are based on characterization. These values are not covered by test limits in production.

### 33.14.4. SWD Timing

Figure 33-17. SWD Interface Signals

#### Read Cycle

#### Write Cycle

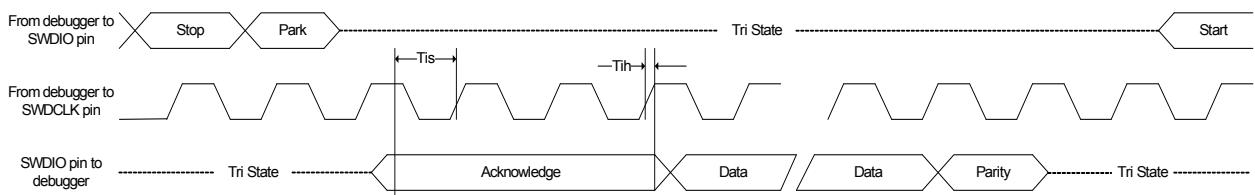

Table 33-47. SWD Timings<sup>(1)</sup>

Symbol	Parameter	Conditions	Min.	Max.	Units
Thigh	SWDCLK High period	$V_{VDDIO}$ from 3.0 V to 3.6 V, maximum external capacitor = 40 pF	10	500000	ns
Tlow	SWDCLK Low period		10	500000	
Tos	SWDIO output skew to falling edge SWDCLK		-5	5	
Tis	Input Setup time required between SWDIO		4	-	
Tih	Input Hold time required between SWDIO and rising edge SWDCLK		1	-	

Note: 1. These values are based on simulation. These values are not covered by test limits in production or characterization.

## 34. Packaging Information

### 34.1. Thermal Considerations

#### Related Links

[Junction Temperature](#) on page 641

#### 34.1.1. Thermal Resistance Data

The following *table* summarizes the thermal resistance data depending on the package.

**Table 34-1. Thermal Resistance Data**

Package Type	$\theta_{JA}$	$\theta_{JC}$
32-pin TQFP	68.0 °C/W	25.8 °C/W
48-pin TQFP	78.8 °C/W	12.3 °C/W
64-pin TQFP	66.7 °C/W	11.9 °C/W
32-pin QFN	37.2 °C/W	13.1 °C/W
48-pin QFN	33.0 °C/W	11.4 °C/W
64-pin QFN	33.5 °C/W	11.2 °C/W
64-ball UFBGA	67.4 °C/W	12.4 °C/W
45-ball WLCSP	37.0 °C/W	0.36 °C/W

#### 34.1.2. Junction Temperature

The average chip-junction temperature,  $T_J$ , in °C can be obtained from the following:

1.  $T_J = T_A + (P_D \times \theta_{JA})$
2.  $T_J = T_A + (P_D \times (\theta_{HEATSINK} + \theta_{JC}))$

where:

- $\theta_{JA}$  = Package thermal resistance, Junction-to-ambient (°C/W), see Thermal Resistance Data
- $\theta_{JC}$  = Package thermal resistance, Junction-to-case thermal resistance (°C/W), see Thermal Resistance Data
- $\theta_{HEATSINK}$  = Thermal resistance (°C/W) specification of the external cooling device
- $P_D$  = Device power consumption (W)
- $T_A$  = Ambient temperature (°C)

From the first equation, the user can derive the estimated lifetime of the chip and decide if a cooling device is necessary or not. If a cooling device is to be fitted on the chip, the second equation should be used to compute the resulting average chip-junction temperature  $T_J$  in °C.

### 34.3. Soldering Profile

The following table gives the recommended soldering profile from J-STD-20.

**Table 34-26.**

Profile Feature	Green Package
Average Ramp-up Rate (217°C to peak)	3°C/s max.
Preheat Temperature 175°C ±25°C	150-200°C
Time Maintained Above 217°C	60-150s
Time within 5°C of Actual Peak Temperature	30s
Peak Temperature Range	260°C
Ramp-down Rate	6°C/s max.
Time 25°C to Peak Temperature	8 minutes max.

A maximum of three reflow passes is allowed per component.

## 35. Schematic Checklist

### 35.1. Introduction

This chapter describes a common checklist which should be used when starting and reviewing the schematics for a SAM D20 design. This chapter illustrates a recommended power supply connection, how to connect external analog references, programmer, debugger, oscillator and crystal.

#### 35.1.1. Operation in Noisy Environment

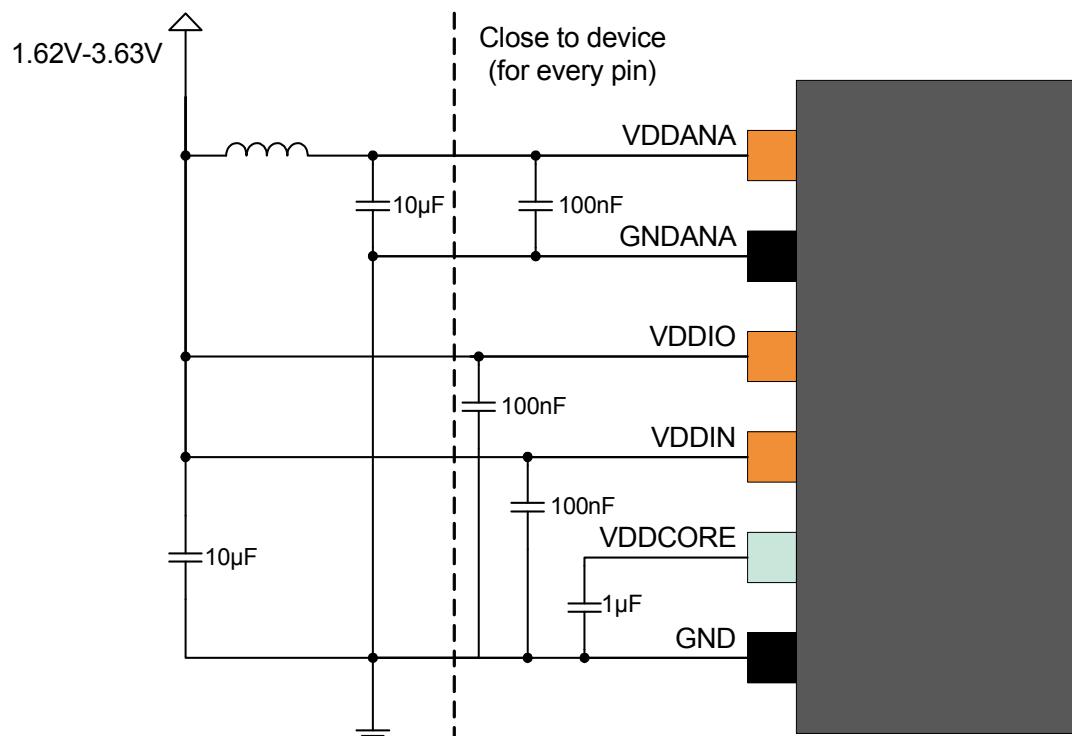

If the device is operating in an environment with much electromagnetic noise it must be protected from this noise to ensure reliable operation. In addition to following best practice EMC design guidelines, the recommendations listed in the schematic checklist sections must be followed. In particular placing decoupling capacitors very close to the power pins, a RC-filter on the  $\overline{\text{RESET}}$  pin, and a pull-up resistor on the SWCLK pin is critical for reliable operations. It is also relevant to eliminate or attenuate noise in order to avoid that it reaches supply pins, I/O pins and crystals.

### 35.2. Power Supply

The SAM D20 supports a single power supply from 1.62V - 3.63V.

#### 35.2.1. Power Supply Connections

Figure 35-1. Power Supply Schematic

**Table 35-1. Power Supply Connections,  $V_{DDCORE}$  From Internal Regulator**

Signal Name	Recommended Pin Connection	Description
$V_{DDIO}$	1.62V - 3.63V Decoupling/filtering capacitors 100nF <sup>(1)(2)</sup> and 10 $\mu$ F <sup>(1)</sup> Decoupling/filtering inductor 10 $\mu$ H <sup>(1)(3)</sup>	Digital supply voltage
$V_{DDANA}$	1.62V - 3.63V Decoupling/filtering capacitors 100nF <sup>(1)(2)</sup> and 10 $\mu$ F <sup>(1)</sup> Ferrite bead <sup>(4)</sup> prevents the $V_{DD}$ noise interfering the $V_{DDANA}$	Analog supply voltage
$V_{DDCORE}$	1.6V to 1.8V Decoupling/filtering capacitor 1 $\mu$ F <sup>(1)(2)</sup>	Core supply voltage / external decoupling pin
GND		Ground
$GND_{ANA}$		Ground for the analog power domain

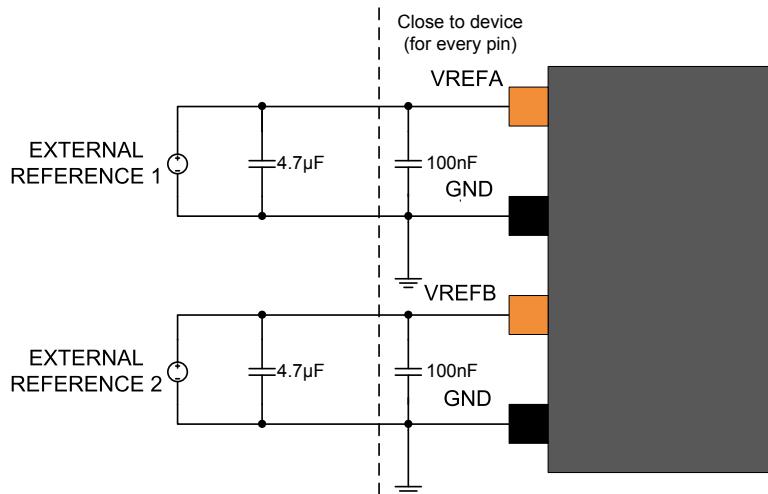

**Note:**

1. These values are only given as typical examples.
2. Decoupling capacitor should be placed close to the device for each supply pin pair in the signal group, low ESR caps should be used for better decoupling.
3. An inductor should be added between the external power and the  $V_{DD}$  for power filtering.
4. Ferrite bead has better filtering performance than the common inductor at high frequencies. It can be added between  $V_{DD}$  and  $V_{DDANA}$  for preventing digital noise from entering the analog power domain. The bead should provide enough impedance (e.g. 50 $\Omega$  at 20MHz and 220 $\Omega$  at 100MHz) for separating the digital power from the analog power domain. Make sure to select a ferrite bead designed for filtering applications with a low DC resistance to avoid a large voltage drop across the ferrite bead.

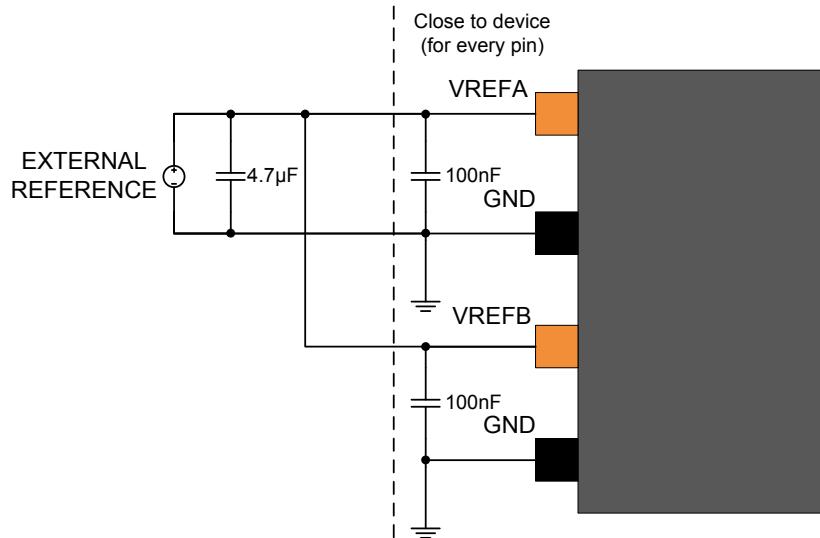

### 35.3. External Analog Reference Connections

The following schematic checklist is only necessary if the application is using one or more of the external analog references. If the internal references are used instead, the following circuits are not necessary.

**Figure 35-2. External Analog Reference Schematic With Two References**

**Figure 35-3. External Analog Reference Schematic With One Reference**

**Table 35-2. External Analog Reference Connections**

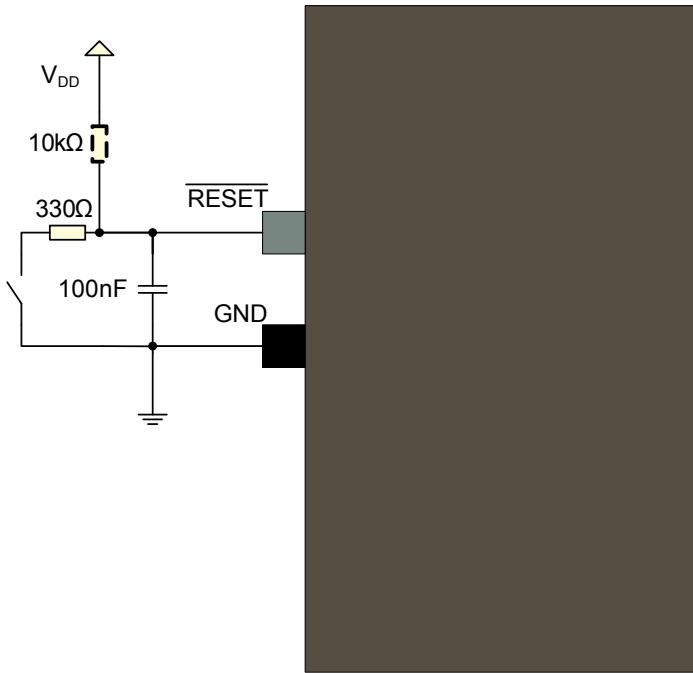

Signal Name	Recommended Pin Connection	Description
VREFx	1.0V to $V_{DDANA}$ - 0.6V for ADC 1.0V to $V_{DDANA}$ - 0.6V for DAC Decoupling/filtering capacitors 100nF <sup>(1)(2)</sup> and 4.7µF <sup>(1)</sup>	External reference from VREFx pin on the analog port
GND		Ground

1. These values are given as a typical example.
2. Decoupling capacitor should be placed close to the device for each supply pin pair in the signal group.

#### 35.4. External Reset Circuit

The external reset circuit is connected to the  $\overline{\text{RESET}}$  pin when the external reset function is used. If the external reset function has been disabled, the circuit is not necessary. The reset switch can also be removed, if the manual reset is not necessary. The  $\overline{\text{RESET}}$  pin itself has an internal pull-up resistor, hence it is optional to also add an external pull-up resistor.

Figure 35-4. External Reset Circuit Example Schematic

A pull-up resistor makes sure that the reset does not go low unintended causing a device reset. An additional resistor has been added in series with the switch to safely discharge the filtering capacitor, i.e. preventing a current surge when shorting the filtering capacitor which again causes a noise spike that can have a negative effect on the system.

Table 35-3. Reset Circuit Connections

Signal Name	Recommended Pin Connection	Description
RESET	Reset low level threshold voltage $V_{DDIO} = 1.\text{V} - 2.\text{0V}$ : Below $0.33 * V_{DDIO}$ $V_{DDIO} = 2.\text{7V} - 3.\text{6V}$ : Below $0.36 * V_{DDIO}$ Decoupling/filter capacitor $100\text{nF}$ <sup>(1)</sup> Pull-up resistor $10\text{k}\Omega$ <sup>(1)(2)</sup> Resistor in series with the switch $330\Omega$ <sup>(1)</sup>	Reset pin

1. These values are given as a typical example.
2. The SAM D20 features an internal pull-up resistor on the  $\overline{\text{RESET}}$  pin, hence an external pull-up is optional.

## 35.5. Clocks and Crystal Oscillators

The SAM D20 can be run from internal or external clock sources, or a mix of internal and external sources. An example of usage will be to use the internal 8MHz oscillator as source for the system clock, and an external 32.768kHz watch crystal as clock source for the Real-Time counter (RTC).

### 35.5.1. External Clock Source

Figure 35-5. External Clock Source Example Schematic

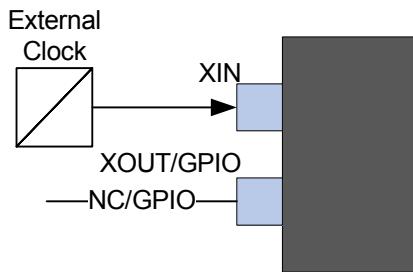

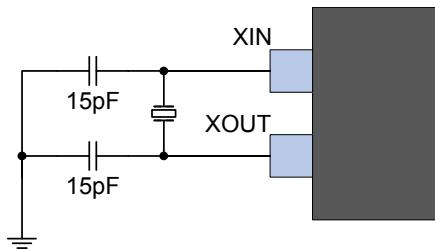

Table 35-4. External Clock Source Connections

Signal Name	Recommended Pin Connection	Description
XIN	XIN is used as input for an external clock signal	Input for inverting oscillator pin
XOUT/GPIO	Can be left unconnected or used as normal GPIO	

### 35.5.2. Crystal Oscillator

Figure 35-6. Crystal Oscillator Example Schematic

The crystal should be located as close to the device as possible. Long signal lines may cause too high load to operate the crystal, and cause crosstalk to other parts of the system.

Table 35-5. Crystal Oscillator Checklist

Signal Name	Recommended Pin Connection	Description
XIN	Load capacitor 15pF <sup>(1)(2)</sup>	External crystal between 0.4 to 30MHz
XOUT	Load capacitor 15pF <sup>(1)(2)</sup>	

1. These values are given only as typical example.
2. Decoupling capacitor should be placed close to the device for each supply pin pair in the signal group.

### 35.5.3. External Real Time Oscillator

The low frequency crystal oscillator is optimized for use with a 32.768kHz watch crystal. When selecting crystals, load capacitance and crystal's Equivalent Series Resistance (ESR) must be taken into consideration. Both values are specified by the crystal vendor.

The SAM D20 oscillator is optimized for very low power consumption, hence close attention should be made when selecting crystals, see the table below for maximum ESR recommendations on 9pF and 12.5pF crystals.

The Low-frequency Crystal Oscillator provides an internal load capacitance of typical values available in Table , 32kHz Crystal Oscillator Characteristics. This internal load capacitance and PCB capacitance can

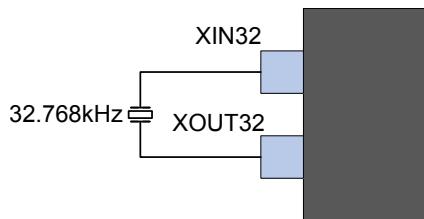

allow to use a Crystal inferior to 12.5pF load capacitance without external capacitors as shown in the following figure.

**Table 35-6. Maximum ESR Recommendation for 32.768kHz Crystal**

Crystal C <sub>L</sub> (pF)	Max ESR [kΩ]
12.5	313

Note: Maximum ESR is typical value based on characterization. These values are not covered by test limits in production.

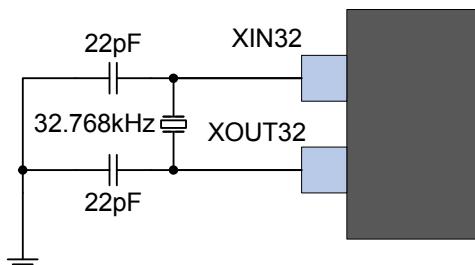

**Figure 35-7. External Real Time Oscillator without Load Capacitor**

However, to improve Crystal accuracy and Safety Factor, it can be recommended by crystal datasheet to add external capacitors as shown in the next figure.

To find suitable load capacitance for a 32.768kHz crystal, consult the crystal datasheet.

**Figure 35-8. External Real Time Oscillator with Load Capacitor**

**Table 35-7. External Real Time Oscillator Checklist**

Signal Name	Recommended Pin Connection	Description
XIN32	Load capacitor 22pF <sup>(1)(2)</sup>	Timer oscillator input
XOUT32	Load capacitor 22pF <sup>(1)(2)</sup>	Timer oscillator output

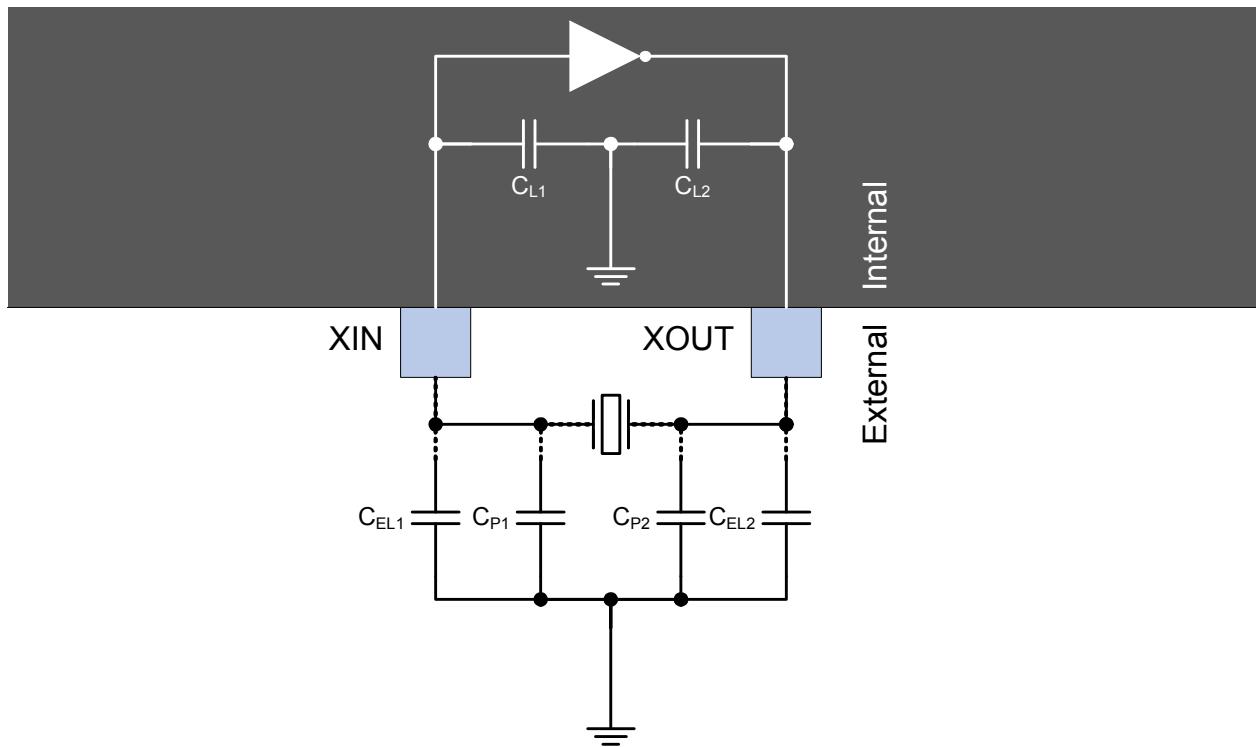

1. These values are given only as typical examples.
2. Decoupling capacitor should be placed close to the device for each supply pin pair in the signal group.

**Note:** In order to minimize the cycle-to-cycle jitter of the external oscillator, keep the neighboring pins as steady as possible. For neighboring pin details, refer to the Oscillator Pinout section.

#### 35.5.4. Calculating the Correct Crystal Decoupling Capacitor

In order to calculate correct load capacitor for a given crystal one can use the model shown in the next figure which includes internal capacitors C<sub>Ln</sub>, external parasitic capacitance C<sub>ELn</sub> and external load capacitance C<sub>Pn</sub>.

**Figure 35-9. Crystal Circuit With Internal, External and Parasitic Capacitance**

Using this model the total capacitive load for the crystal can be calculated as shown in the equation below:

$$\sum C_{tot} = \frac{(C_{L1} + C_{P1} + C_{EL1})(C_{L2} + C_{P2} + C_{EL2})}{C_{L1} + C_{P1} + C_{EL1} + C_{L2} + C_{P2} + C_{EL2}}$$

where  $C_{tot}$  is the total load capacitance seen by the crystal, this value should be equal to the load capacitance value found in the crystal manufacturer datasheet.

The parasitic capacitance  $C_{ELn}$  can in most applications be disregarded as these are usually very small. If accounted for the value is dependent on the PCB material and PCB layout.

For some crystal the internal capacitive load provided by the device itself can be enough. To calculate the total load capacitance in this case,  $C_{ELn}$  and  $C_{Pn}$  are both zero,  $C_{L1} = C_{L2} = C_L$ , and the equation reduces to the following:

$$\sum C_{tot} = \frac{C_L}{2}$$

The next table shows the device equivalent internal pin capacitance.

**Table 35-8. Equivalent Internal Pin Capacitance**

Symbol	Value	Description
$C_{XIN32}$	3.05pF	Equivalent internal pin capacitance
$C_{XOUT32}$	3.29pF	Equivalent internal pin capacitance

## 35.6. Unused or Unconnected Pins

For unused pins the default state of the pins for the will give the lowest current leakage. There is thus no need to do any configuration of the unused pins in order to lower the power consumption.

## 35.7. Programming and Debug Ports

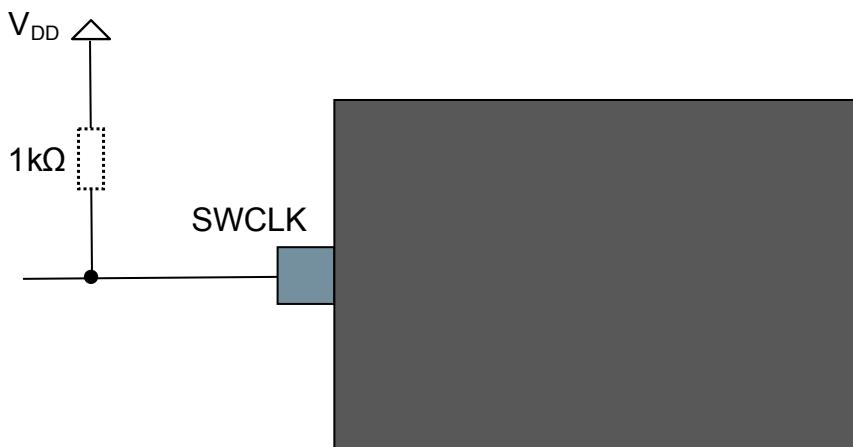

For programming and/or debugging the SAM D20 the device should be connected using the Serial Wire Debug, SWD, interface. Currently the SWD interface is supported by several Atmel and third party programmers and debuggers, like the SAM-ICE, JTAGICE3 or SAM D20 Xplained Pro (SAM D20 evaluation kit) Embedded Debugger.

Refer to the SAM-ICE, JTAGICE3 or SAM D20 Xplained Pro user guides for details on debugging and programming connections and options. For connecting to any other programming or debugging tool, refer to that specific programmer or debugger's user guide.

The SAM D20 Xplained Pro evaluation board for the SAM D20 supports programming and debugging through the onboard embedded debugger so no external programmer or debugger is needed.

Note that a pull-up resistor on the SWCLK pin is critical for reliable operations. Refer to related link for more information.

**Figure 35-10. SWCLK Circuit Connections**

**Table 35-9. SWCLK Circuit Connections**

Pin Name	Description	Recommended Pin Connection
SWCLK	Serial wire clock pin	Pull-up resistor $1k\Omega$

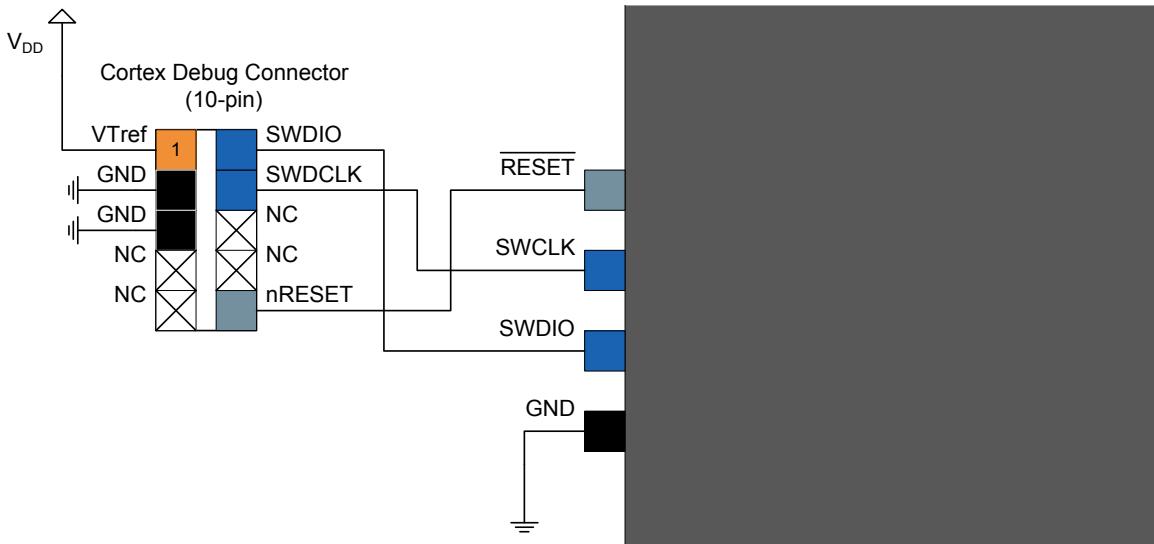

### Related Links

[Operation in Noisy Environment](#) on page 652

### 35.7.1. Cortex Debug Connector (10-pin)

For debuggers and/or programmers that support the Cortex Debug Connector (10-pin) interface the signals should be connected as shown in the figure below with details described in the next table.

**Figure 35-11. Cortex Debug Connector (10-pin)**

**Table 35-10. Cortex Debug Connector (10-pin)**

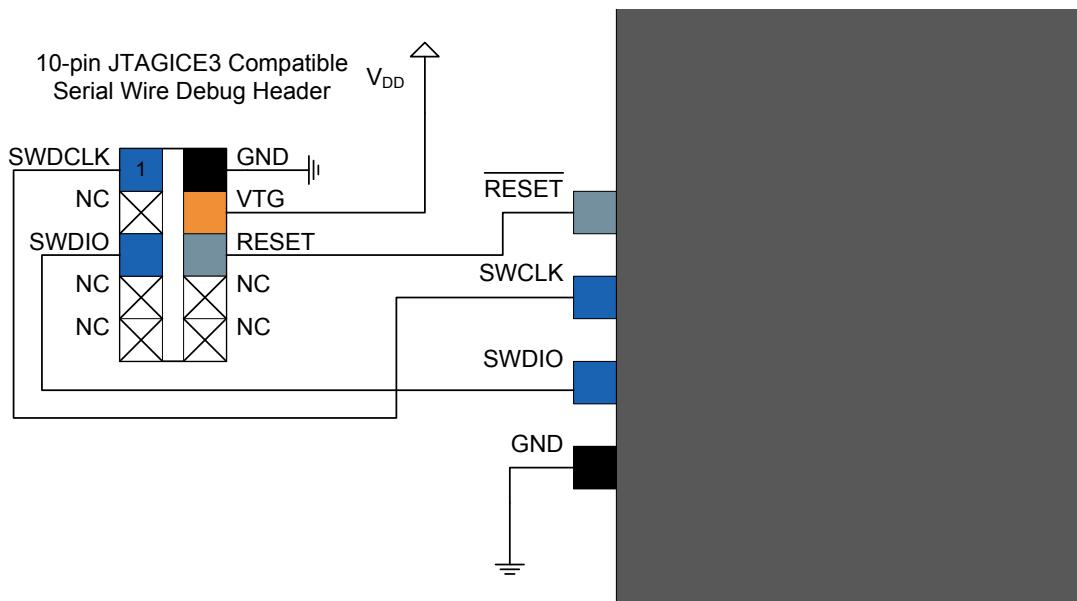

Header Signal Name	Description	Recommended Pin Connection
SWDCLK	Serial wire clock pin	Pull-up resistor 1kΩ
SWDIO	Serial wire bidirectional data pin	
RESET	Target device reset pin, active low Refer to <a href="#">External Reset Circuit</a> .	
VTref	Target voltage sense, should be connected to the device V <sub>DD</sub>	
GND	Ground	

### 35.7.2. 10-pin JTAGICE3 Compatible Serial Wire Debug Interface

The JTAGICE3 debugger and programmer does not support the Cortex Debug Connector (10-pin) directly, hence a special pinout is needed to directly connect the SAM D20 to the JTAGICE3, alternatively one can use the JTAGICE3 squid cable and manually match the signals between the JTAGICE3 and SAM D20. The following figure describes how to connect a 10-pin header that support connecting the JTAGICE3 directly to the SAM D20 without the need for a squid cable.

To connect the JTAGICE3 programmer and debugger to the SAM D20, one can either use the JTAGICE3 squid cable, or use a 10-pin connector as shown in the figure below with details given in the next table to connect to the target using the JTAGICE3 50 mil cable directly.

**Figure 35-12. 10-pin JTAGICE3 Compatible Serial Wire Debug Interface**

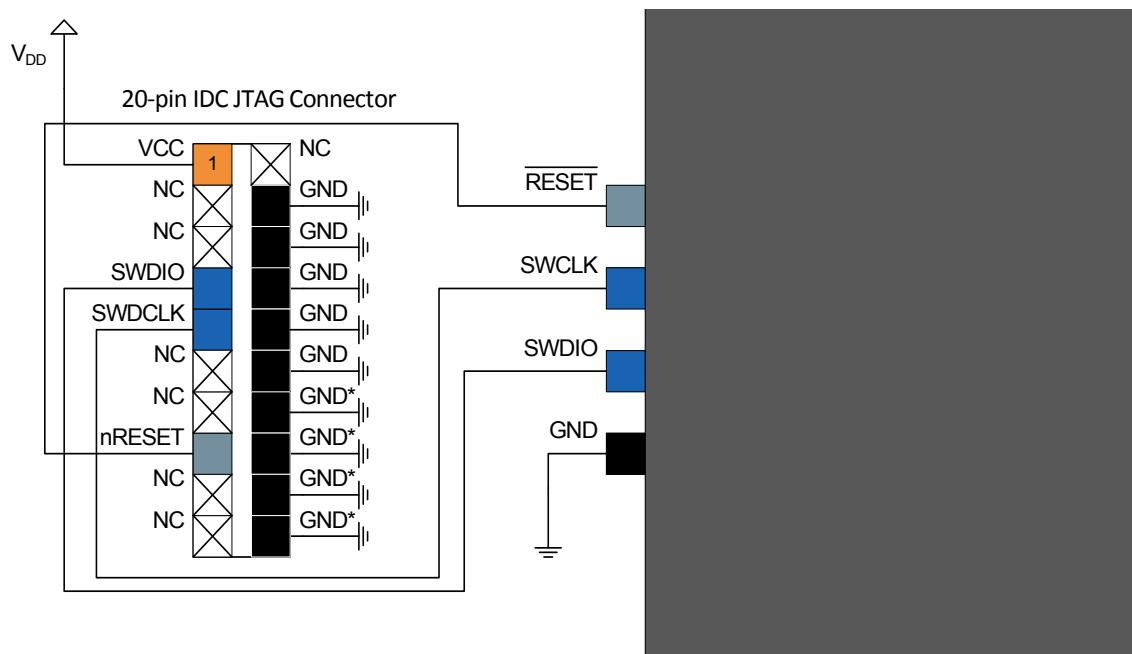

**Table 35-11. 10-pin JTAGICE3 Compatible Serial Wire Debug Interface**

Header Signal Name	Description
SWDCLK	Serial wire clock pin
SWDIO	Serial wire bidirectional data pin
RESET	Target device reset pin, active low
VTG	Target voltage sense, should be connected to the device $V_{DD}$
GND	Ground

### 35.7.3. 20-pin IDC JTAG Connector

For debuggers and/or programmers that support the 20-pin IDC JTAG Connector, e.g. the SAM-ICE, the signals should be connected as shown in the next figure with details described in the table.

**Figure 35-13. 20-pin IDC JTAG Connector**

**Table 35-12. 20-pin IDC JTAG Connector**

Header Signal Name	Description
SWDCLK	Serial wire clock pin
SWDIO	Serial wire bidirectional data pin
RESET	Target device reset pin, active low
VCC	Target voltage sense, should be connected to the device V <sub>DD</sub>
GND	Ground
GND*	These pins are reserved for firmware extension purposes. They can be left open or connected to GND in normal debug environment. They are not essential for SWD in general.

## 36. Errata

### 36.1. Errata

The device variant (last letter of the ordering number) is independent of the die revision (DSU.DID.REVISION): The device variant denotes functional differences, whereas the die revision marks evolution of the die.

#### 36.1.1. Die Revision B

##### 36.1.1.1. Device

**1 – When VDDIN is lower than the POR threshold during power rise or fall, an internal pull-up resistor is enabled on pins with PTC functionality (see PORT Function Multiplexing). Note that this behavior will be present even if PTC functionality is not enabled on the pin. The POR level is defined in the “Power-On Reset (POR) Characteristics” chapter.**

**Errata reference: 10805**

**Fix/Workaround:**

Use a pin without PTC functionality if the pull-up could damage your application during power up.

**2 – The values stored in the NVM software calibration area for the DFLL calibration are not valid.**

**Errata reference: 12843**

**Fix/Workaround:**

None.

**3 – In the table ""NVM User Row Mapping"", the WDT Window bitfield default value on silicon is not as specified in the datasheet. The datasheet defines the default value as 0x5, while it is 0xB on silicon.**

**Errata reference: 13951**

**Fix/Workaround:**

None.

**4 – Clock Failure detection for external OSC does not work in standby mode.**

**Errata reference: 12688**

**Fix/Workaround:**

Before entering standby mode, move the CPU clock to an internal RC, disable external OSC and disable the Clock Failure detector. Upon CPU wakeup, restart external OSC (if it does not start, the failure occurred during standby), enable the Clock Failure detector and move the CPU clock to the external OSC.

**5 – If APB clock is stopped and GCLK clock is running, APB read access to read-synchronized registers will freeze the system. The CPU and the DAP AHB-AP are stalled, as a consequence debug operation is impossible.**

**Errata reference: 10416**

**Fix/Workaround:**

Do not make read access to read-synchronized registers when APB clock is stopped and GCLK is running. To recover from this situation, power cycle the device or reset the device using the RESETN pin.

**6 – The PORT output driver strength feature is not available.**

**Errata reference:** 12684

**Fix/Workaround:**

None

**7 – The SYSTICK calibration value is incorrect.**

**Errata reference:** 14153

**Fix/Workaround:**

The correct SYSTICK calibration value is 0x40000000. This value should not be used to initialize the Systick RELOAD value register, which should be initialized instead with a value depending on the main clock frequency and on the tick period required by the application. For a detailed description of the SYSTICK module, refer to the official ARM Cortex-M0+ documentation.

**8 – Maximum toggle frequency on all pins in worst case operating condition is 8MHz. This affects all operations on the pins, including serial communications.**

**Errata reference:** 10335

**Fix/Workaround:**

None.

**9 – Do not enable Timers/Counters, AC (Analog Comparator), GCLK (Generic Clock Controller), and SERCOM (I2C and SPI) to control Digital outputs in standby sleep mode.**

**Errata reference:** 12786

**Fix/Workaround:**

Set the voltage regulator in Normal mode before entering STANDBY sleep mode. This is done by setting the RUNSTDBY bit in the VREG register.

**10 – After a clock failure detection (INTFLAG.CFD = 1), if INTFLAG.CFD is cleared while the clock is still broken, the system is stuck.**

**Errata reference:** 12687

**Fix/Workaround:**

After a clock failure detection, do not clear INTFLAG.CFD or perform a system reset.

**11 – With default bit and register settings the device does not work as specified in STANDBY mode if load current exceeds 100µA.**

**Errata reference:** 11082

**Fix/Workaround:**

Set the FORCELDO bit in the VREG register.

**12 – In Standby, Idle1 and Idle2 sleep modes the device might not wake up from sleep. An External Reset, Power on Reset or Watch Dog Reset will start the device again.**

**Errata reference:** 13140

**Fix/Workaround:**

the SLEEP prm bits in the NVMCTRL.CTRLB register must be written to 3 (NVMCTRL - CTRLB.bit.SLEEP prm = 3) to ensure correct operation of the device. The average power consumption of the device will increase with 20uA compared to numbers in the electrical characteristics chapter.

**13 – The temperature sensor is not accurate. No value is written into the Temperature Log row during production test.**

**Errata reference:** 11731

**Fix/Workaround:**

None

**14 – The DFLLVAL.COARSE, DFLLVAL.FINE, DFLLMUL.CSTEP and DFLLMUL.FSTEP bit groups are not correctly located in the register map. DFLLVAL.COARSE is only 5 bits and located in DFLLVAL[12..8]. DFLLVAL.FINE is only 8 bits and located in DFLLVAL[7:0]. DFLLMUL.CSTEP is only 5 bits and located in DFLLMUL[28:24]. DFLLMUL.FSTEP is only 8 bits and located in DFLLMUL[23:16]**

**Errata reference:** 10988

**Fix/Workaround:**

DFLLVAL.COARSE, DFLLVAL.FINE, DFLLMUL.CSTEP and DFLLMUL.FSTEP should not be used if code compatibility is required with future device revisions.

**15 – If the external XOSC32K is broken, neither the external pin RST nor the GCLK software reset can reset the GCLK generators using XOSC32K as source clock.**

**Errata reference:** 12164

**Fix/Workaround:**

Do a power cycle to reset the GCLK generators after an external XOSC32K failure.

#### 36.1.1.2. Flash

**1 – When cache read mode is set to deterministic (READMODE=2), setting CACHEDIS=1 does not lead to 0 wait states on Flash access.**

**Errata reference:** 10830

**Fix/Workaround:**

When disabling the cache (CTRLB.CACHEDIS=1), the user must also set READMODE to 0 (CTRLB.READMODE=0).

**2 – When NVMCTRL issues either erase or write commands and the NVMCTRL cache is not in LOW\_POWER mode, CPU hardfault exception may occur.**

**Errata reference:** 10804

**Fix/Workaround:**

Either:

- turn off cache before issuing flash commands by setting the NVMCTRL CTRLB.CACHEDIS bit to one.
- Configure the cache in LOW\_POWER mode by writing 0x1 into the NVMCTRL CTRLB.READMODE bits.

#### 36.1.1.3. DSU

**1 – If a debugger has issued a DSU Cold-Plugging procedure and then released the CPU from the resulting ""CPU Reset Extension"", the CPU will be held in ""CPU Reset Extension"" after any upcoming reset event.**

**Errata reference:** 12015

**Fix/workaround:**

The CPU must be released from the ""CPU Reset Extension"" either by writing a one in the DSU STATUSA.CRSTEXT register or by applying an external reset with SWCLK high or by power cycling the device.

**2 – The MBIST ""Pause-on-Error"" feature is not functional on this device.**

**Errata reference: 14324**

**Fix/Workaround:**

Do not use the ""Pause-on-Error"" feature.

#### 36.1.1.4. PM

**1 – In debug mode, if a watchdog reset occurs, the debug session is lost.**

**Errata reference: 12196**

**Fix/Workaround:**

A new debug session must be restart after a watchdog reset.

**2 – The SysTick timer does not generate a wake up signal to the Power Manager, and therefore cannot be used to wake up the CPU from sleep mode.**

**Errata reference: 11012**

**Fix/Workaround:**

None.

#### 36.1.1.5. GCLK

**1 – When the GCLK generator is enabled (GENCTRL.GENEN = 1), set as output (GENCTRL.OE = 1) and use a division factor of one (GENDIV.DIV = 1 or 0 and GENCTRL.DIVSEL=0), the GCLK\_IO might not be set to the configured GENCTRL.OOV value after disabling the GCLK generator (GENCTRL.GENEN=0).**

**Errata reference: 10716**

**Fix/Workaround:**

Disable the OE request of the GCLK generator (GENCTRL.OE = 0) before disabling the GCLK generator (GENCTRL.GENEN = 0).

**2 – The GCLK Generator clock is stuck when disabling the generator and changing the division factor from one to a different value while the GCLK generator is set as output. When the GCLK generator is enabled (GENCTRL.GENEN=1), set as output (GENCTRL.OE=1) and use a division factor of one (GENDIV.DIV=1 or 0 and GENCTRL.DIVSEL=0), if the division factor is written to a value different of one or zero after disabling the GCLK generator (GENCTRL.GENEN=0), the GCLK generator will be stuck.**

**Errata reference: 10686**

**Fix/Workaround:**

Disable the OE request of the GCLK generator (GENCTRL.OE=0) before disabling the GCLK generator (GENCTRL.GENEN=0).

**3 – When a GCLK is locked and the generator used by the locked GCLK is not GCLK generator 1, issuing a GCLK software reset will lock up the GCLK with the SYNCBUSY flag always set.**

**Errata reference: 10645**

**Fix/Workaround:**

Do not issue a GCLK SWRST or map GCLK generator 1 to ""locked"" GCLKs.

### 36.1.1.6. DFLL48M

**1 – If the firmware writes to the DFLLMUL.MUL register in the same cycle as the closed loop mode tries to update it, the fine calibration will first be reset to midpoint and then incremented/decremented by the closed loop mode. Then the coarse calibration will be performed with the updated fine value. If this happens before the dfll have got a lock, the new fine calibration value can be anything between 128-DFLLMUL.FSTEP and 128+DFLLMUL.FSTEP which could give smaller calibration range for the fine calibration.**

**Errata reference: 10634**

**Fix/Workaround:**

Always wait until the DFLL48M has locked before writing the DFLLMUL.MUL register

**2 – The DFLL clock must be requested before being configured otherwise a write access to a DFLL register can freeze the device.**

**Errata reference: 9905**

**Fix/Workaround:**

Write a zero to the DFLL ONDEMAND bit in the DFLLCTRL register before configuring the DFLL module.

**3 – Changing the DFLLVAL.FINE calibration bits of the DFLL48M Digital Frequency Locked Loop might result in a short output frequency overshoot. This might occur both in open loop mode while writing DFLLVAL.FINE by software and closed loop mode when the DFLL automatically adjusts its output frequency.**

**Errata reference: 10537**

**Fix/Workaround:**

- When using DFLL48M in open loop mode, be sure the DFLL48M is not used by any module while DFLLVAL.FINE is written.

- When using DFLL48M in closed loop mode, be sure that DFLLCTRL.STABLE is written to 1. The DFLL clock should not be used by any modules until the DFLL locks are set.

If the application requires on-the-fly DFLL calibration (temperature/VCC drift compensation), the firmware should perform, either periodically or when the DFLL48M frequency differ too much from target frequency (indicated by DFLLVAL.DIFF), the following:

- o Switch system clock/module clocks to different clock than DFLL48M
- o Re-initiate a DFLL48M closed loop lock sequence by disabling and re-enabling the DFLL48M

o Wait for fine lock (PCLKSR.DFLLLCKF set to 1)

o Switch back system clock/module clocks to the DFLL48M

Better accuracy is achieved using a high multiplier for the DFLL48M, using a scaled down or slow clock as reference. A multiplier of 6 will have a theoretical worst case frequency deviation from the reference clock of +/- 8.33%. A multiplier of 500 will have a theoretical worst case frequency deviation from the reference clock of +/- 0.1%.

**4 – If the DFLL48M reaches the maximum or minimum COARSE or FINE calibration values during the locking sequence, an out of bounds**

**interrupt will be generated. These interrupts will be generated even if the final calibration values at DFLL48M lock are not at maximum or minimum, and might therefore be false out of bounds interrupts.**

**Errata reference: 10669**

**Fix/Workaround:**

Check that the lockbits: DFLLCKC and DFLLCKF in the SYSCTRL Interrupt Flag Status and Clear register (INTFLAG) are both set before enabling the DFLLOOB interrupt.

#### 36.1.1.7. XOSC32K

**1 – The automatic amplitude control of the XOSC32K does not work.**

**Errata reference: 10933**

**Fix/Workaround:**

Use the XOSC32K with Automatic Amplitude control disabled (XOSC32K.AAMPEN = 0)

#### 36.1.1.8. EIC

**1 – When the EIC is configured to generate an interrupt on a low level or rising edge or both edges (CONFIGn.SENSEx) with the filter enabled (CONFIGn.FILTENx), a spurious flag might appear for the dedicated pin on the INTFLAG.EXTINT[x] register as soon as the EIC is enabled using CTRLA ENABLE bit.**

**Errata reference: 15341**

**Fix/Workaround:**

Clear the INTFLAG bit once the EIC enabled and before enabling the interrupts.

#### 36.1.1.9. NVMCTRL

**1 – Default value of MANW in NVM.CTRLB is 0.**

**This can lead to spurious writes to the NVM if a data write is done through a pointer with a wrong address corresponding to NVM area.**

**Errata reference: 13134**

**Fix/Workaround:**

Set MANW in the NVM.CTRLB to 1 at startup

**2 – When external reset is active it causes a high leakage current on VDDIO.**

**Errata reference: 13446**

**Fix/Workaround:**

Minimize the time external reset is active.

**3 – When the part is secured and EEPROM emulation area configured to none, the CRC32 is not executed on the entire flash area but up to the on-chip flash size minus half a row.**

**Errata reference: 11988**

**Fix/Workaround:**

When using CRC32 on a protected device with EEPROM emulation area configured to none, compute the reference CRC32 value to the full chip flash size minus half row.

### 36.1.1.10. EVSYS

**1 – Using synchronous or resynchronized paths, some channels (0,3,6,7) detect an overrun on every event even if no overrun condition is present.**

**Errata reference: 10895**

**Fix/Workaround:**

- Ignore overrun detection bit for channels 0,3,6,7.
- Use channels 1,2,4,5 if overrun detection is required.

**2 – Changing the selected generator of a channel can trigger a spurious interrupt/event.**

**Errata reference: 10443**

**Fix/Workaround:**

To change the generator of a channel, first write with EDGESEL written to zero, then perform a second write with EDGESEL written to its target value.

### 36.1.1.11. SERCOM

**1 – The SERCOM SPI CTRLA register bit 17 (DOPO Bit 1) will always be zero, and cannot be changed. Therefore the SERCOM SPI cannot be switched between master and slave mode on the same DI and DO pins.**

**Errata reference: 10812**

**Fix/Workaround:**

Connect the alternate DI and DO pins externally and use the port MUX to switch between pin configurations for master and slave functionality.

**2 – When the SERCOM is in slave SPI mode, the BUFOVF flag is not automatically cleared when CTRLB.RXEN is set to zero.**

**Errata reference: 10563**

**Fix/Workaround:**

The BUFOVF flag must be manually cleared by software.

**3 – In TWI master mode, an ongoing transaction should be stalled immediately when DBGCTRL.DBGSTOP is set and the CPU enters debug mode. Instead, it is stopped when the current byte transaction is completed and the corresponding interrupt is triggered if enabled.**

**Errata reference: 12499**

**Fix/Workaround:**

In TWI master mode, keep DBGCTRL.DBGSTOP=0 when in debug mode.

**4 – The SERCOM SPI BUFOVF status bit is not set until the next character is received after a buffer overflow, instead of directly after the overflow has occurred. Furthermore the CTRLA.IBON bit will always be zero and cannot be changed.**

**Errata reference: 10551**

**Fix/Workaround:**

None.

### 36.1.1.12. TC

**1 – Spurious TC overflow and Match/Capture events may occur.**

**Errata reference: 13268**

**Fix/Workaround:**

Do not use the TC overflow and Match/Capture events. Use the corresponding Interrupts instead.

### 36.1.1.13. ADC

**1 – When the ADC bus clock frequency(CLK\_ADC\_APB) is smaller than the ADC asynchronous clock frequency(GCLK\_ADC), issuing an ADC SWRST (ADC.CTRLA.SWRST) will lock up the ADC with the SYNCBUSY (ADC.STATUS.SYNCBUSY) flag always set.**

**Errata reference: 10987**

**Fix/Workaround:**

Do not issue an ADC SWRST if the ADC bus clock frequency (CLK\_ADC\_APB) is smaller than the ADC asynchronous clock frequency(GCLK\_ADC).

**2 – The automatic right shift of the result when accumulating/averaging ADC samples does not work.**

**Errata reference: 10530**

**Fix/Workaround:**

To accumulate or average more than 16 samples, one must add the number of automatic right shifts to AVGCTRL.ADJRES to perform the correct number of right shifts. For example, for averaging 128 samples, AVGCTRL.ADJRES must be written to 7 instead of 4, as the automatic right shift of 3 is not done. For oversampling to 16 bits resolution, AVGCTRL.ADJRES must be written to 4 instead of 0 as the automatic right shift of 4 is not done.

The maximum number of right shifts that can be done using ADJRES is 7. This means that when averaging more than 128 samples, the result will be more than 12 bits, and the additional right shifts to get the result down to 12 bits must be done by firmware.

### 36.1.1.14. BOD33

**1 – The BOD33 HYST bit is not updated from NVM user row at power on. The reset value of this bit is zero.**

**Errata reference: 10565**

**Fix/Workaround:**

None.

### 36.1.1.15. BOD12

**1 – The BOD12 HYST bit is not updated from NVM user row at power on. The reset value of this bit is zero.**

**Errata reference: 10568**

**Fix/Workaround:**

None.

### 36.1.1.16. PTC

**1 – Some gain settings for the PTC in self-capacitance mode do not work. The two lowest gain settings are not selectable and an attempt by the QTouch Library to set enable of these may result in a higher sensitivity than optimal for the sensor. The PTC will not detect all touches. This errata does not affect mutual-capacitance mode which operates as specified.**

**Errata reference: 10684**

**Fix/Workaround:**

Use SAM D20 revision C or later for self-capacitance touch sensing.

**2 – WCOMP interrupt flag is not stable. The WCOMP interrupt flag will not always be set as described in the datasheet.**

**Errata reference:** 12860

**Fix/Workaround:**

Do not use the WCOMP interrupt. Use the WCOMP event.

### 36.1.2. Die Revision C

#### 36.1.2.1. Device

**1 – When VDDIN is lower than the POR threshold during power rise or fall, an internal pull-up resistor is enabled on pins with PTC functionality (see PORT Function Multiplexing). Note that this behavior will be present even if PTC functionality is not enabled on the pin. The POR level is defined in the “Power-On Reset (POR) Characteristics” chapter.**

**Errata reference:** 10805

**Fix/Workaround:**

Use a pin without PTC functionality if the pull-up could damage your application during power up.

**2 – The values stored in the NVM software calibration area for the DFLL calibration are not valid.**

**Errata reference:** 12843

**Fix/Workaround:**

None.

**3 – In the table ““NVM User Row Mapping””, the WDT Window bitfield default value on silicon is not as specified in the datasheet. The datasheet defines the default value as 0x5, while it is 0xB on silicon.**

**Errata reference:** 13951

**Fix/Workaround:**

None.

**4 – Clock Failure detection for external OSC does not work in standby mode.**

**Errata reference:** 12688

**Fix/Workaround:**

Before entering standby mode, move the CPU clock to an internal RC, disable external OSC and disable the Clock Failure detector. Upon CPU wakeup, restart external OSC (if it does not start, the failure occurred during standby), enable the Clock Failure detector and move the CPU clock to the external OSC.

**5 – If APB clock is stopped and GCLK clock is running, APB read access to read-synchronized registers will freeze the system. The CPU and the DAP AHB-AP are stalled, as a consequence debug operation is impossible.**

**Errata reference:** 10416

**Fix/Workaround:**

Do not make read access to read-synchronized registers when APB clock is stopped and GCLK is running. To recover from this situation, power cycle the device or reset the device using the RESETN pin.

**6 – The PORT output driver strength feature is not available.**

**Errata reference:** 12684

**Fix/Workaround:**

None

**7 – The SYSTICK calibration value is incorrect.**

**Errata reference:** 14153

**Fix/Workaround:**

The correct SYSTICK calibration value is 0x40000000. This value should not be used to initialize the Systick RELOAD value register, which should be initialized instead with a value depending on the main clock frequency and on the tick period required by the application. For a detailed description of the SYSTICK module, refer to the official ARM Cortex-M0+ documentation.

**8 – Maximum toggle frequency on all pins in worst case operating condition is 8MHz. This affects all operations on the pins, including serial communications.**

**Errata reference:** 10335

**Fix/Workaround:**

None.

**9 – Do not enable Timers/Counters, AC (Analog Comparator), GCLK (Generic Clock Controller), and SERCOM (I2C and SPI) to control Digital outputs in standby sleep mode.**

**Errata reference:** 12786

**Fix/Workaround:**

Set the voltage regulator in Normal mode before entering STANDBY sleep mode. This is done by setting the RUNSTDBY bit in the VREG register.

**10 – After a clock failure detection (INTFLAG.CFD = 1), if INTFLAG.CFD is cleared while the clock is still broken, the system is stuck.**

**Errata reference:** 12687

**Fix/Workaround:**

After a clock failure detection, do not clear INTFLAG.CFD or perform a system reset.

**11 – With default bit and register settings the device does not work as specified in STANDBY mode if load current exceeds 100 $\mu$ A.**

**Errata reference:** 11082

**Fix/Workaround:**

Set the FORCELDO bit in the VREG register.

**12 – In Standby, Idle1 and Idle2 sleep modes the device might not wake up from sleep. An External Reset, Power on Reset or Watch Dog Reset will start the device again.**

**Errata reference:** 13140

**Fix/Workaround:**

the SLEEP prm bits in the NVMCTRL.CTRLB register must be written to 3 (NVMCTRL - CTRLB.bit.SLEEP prm = 3) to ensure correct operation of the device. The average power consumption of the device will increase with 20 $\mu$ A compared to numbers in the electrical characteristics chapter.

**13 – The temperature sensor is not accurate. No value is written into the Temperature Log row during production test.**

**Errata reference:** 11731

**Fix/Workaround:**

None

**14 – The DFLLVAL.COARSE, DFLLVAL.FINE, DFLLMUL.CSTEP and DFLLMUL.FSTEP bit groups are not correctly located in the register map. DFLLVAL.COARSE is only 5 bits and located in DFLLVAL[12..8]. DFLLVAL.FINE is only 8 bits and located in DFLLVAL[7:0]. DFLLMUL.CSTEP is only 5 bits and located in DFLLMUL[28:24]. DFLLMUL.FSTEP is only 8 bits and located in DFLLMUL[23:16]**

**Errata reference: 10988**

**Fix/Workaround:**

DFLLVAL.COARSE, DFLLVAL.FINE, DFLLMUL.CSTEP and DFLLMUL.FSTEP should not be used if code compatibility is required with future device revisions.

**15 – If the external XOSC32K is broken, neither the external pin RST nor the GCLK software reset can reset the GCLK generators using XOSC32K as source clock.**

**Errata reference: 12164**

**Fix/Workaround:**

Do a power cycle to reset the GCLK generators after an external XOSC32K failure.

#### 36.1.2.2. Flash

**1 – When cache read mode is set to deterministic (READMODE=2), setting CACHEDIS=1 does not lead to 0 wait states on Flash access.**

**Errata reference: 10830**

**Fix/Workaround:**

When disabling the cache (CTRLB.CACHEDIS=1), the user must also set READMODE to 0 (CTRLB.READMODE=0).

**2 – When NVMCTRL issues either erase or write commands and the NVMCTRL cache is not in LOW\_POWER mode, CPU hardfault exception may occur.**

**Errata reference: 10804**

**Fix/Workaround:**

Either:

- turn off cache before issuing flash commands by setting the NVMCTRL CTRLB.CACHEDIS bit to one.
- Configure the cache in LOW\_POWER mode by writing 0x1 into the NVMCTRL CTRLB.READMODE bits.

#### 36.1.2.3. DSU

**1 – If a debugger has issued a DSU Cold-Plugging procedure and then released the CPU from the resulting ""CPU Reset Extension"", the CPU will be held in ""CPU Reset Extension"" after any upcoming reset event.**

**Errata reference: 12015**

**Fix/workaround:**

The CPU must be released from the ""CPU Reset Extension"" either by writing a one in the DSU STATUSA.CRSTEXT register or by applying an external reset with SWCLK high or by power cycling the device.

**2 – The MBIST ""Pause-on-Error"" feature is not functional on this device.**

**Errata reference: 14324**

**Fix/Workaround:**

Do not use the ""Pause-on-Error"" feature.

#### 36.1.2.4. PM

**1 – In debug mode, if a watchdog reset occurs, the debug session is lost.**

**Errata reference: 12196**

**Fix/Workaround:**

A new debug session must be restart after a watchdog reset.

**2 – The SysTick timer does not generate a wake up signal to the Power Manager, and therefore cannot be used to wake up the CPU from sleep mode.**

**Errata reference: 11012**

**Fix/Workaround:**

None.

#### 36.1.2.5. GCLK

**1 – When the GCLK generator is enabled (GENCTRL.GENEN = 1), set as output (GENCTRL.OE = 1) and use a division factor of one (GENDIV.DIV = 1 or 0 and GENCTRL.DIVSEL=0), the GCLK\_IO might not be set to the configured GENCTRL.OOV value after disabling the GCLK generator (GENCTRL.GENEN=0).**

**Errata reference: 10716**

**Fix/Workaround:**

Disable the OE request of the GCLK generator (GENCTRL.OE = 0) before disabling the GCLK generator (GENCTRL.GENEN = 0).

**2 – The GCLK Generator clock is stuck when disabling the generator and changing the division factor from one to a different value while the GCLK generator is set as output. When the GCLK generator is enabled (GENCTRL.GENEN=1), set as output (GENCTRL.OE=1) and use a division factor of one (GENDIV.DIV=1 or 0 and GENCTRL.DIVSEL=0), if the division factor is written to a value different of one or zero after disabling the GCLK generator (GENCTRL.GENEN=0), the GCLK generator will be stuck.**

**Errata reference: 10686**

**Fix/Workaround:**

Disable the OE request of the GCLK generator (GENCTRL.OE=0) before disabling the GCLK generator (GENCTRL.GENEN=0).

**3 – When a GCLK is locked and the generator used by the locked GCLK is not GCLK generator 1, issuing a GCLK software reset will lock up the GCLK with the SYNCBUSY flag always set.**

**Errata reference: 10645**

**Fix/Workaround:**

Do not issue a GCLK SWRST or map GCLK generator 1 to ""locked"" GCLKs.

#### 36.1.2.6. DFLL48M

**1 – If the firmware writes to the DFLLMUL.MUL register in the same cycle as the closed loop mode tries to update it, the fine calibration will**

**first be reset to midpoint and then incremented/decremented by the closed loop mode. Then the coarse calibration will be performed with the updated fine value. If this happens before the dfll have got a lock, the new fine calibration value can be anything between 128-DFLLMUL.FSTEP and 128+DFLLMUL.FSTEP which could give smaller calibration range for the fine calibration.**

**Errata reference: 10634**

**Fix/Workaround:**

Always wait until the DFLL48M has locked before writing the DFLLMUL.MUL register

**2 – The DFLL clock must be requested before being configured otherwise a write access to a DFLL register can freeze the device.**

**Errata reference: 9905**

**Fix/Workaround:**

Write a zero to the DFLL ONDEMAND bit in the DFLLCTRL register before configuring the DFLL module.

**3 – Changing the DFLLVAL.FINE calibration bits of the DFLL48M Digital Frequency Locked Loop might result in a short output frequency overshoot. This might occur both in open loop mode while writing DFLLVAL.FINE by software and closed loop mode when the DFLL automatically adjusts its output frequency.**

**Errata reference: 10537**

**Fix/Workaround:**

- When using DFLL48M in open loop mode, be sure the DFLL48M is not used by any module while DFLLVAL.FINE is written.

- When using DFLL48M in closed loop mode, be sure that DFLLCTRL.STABLE is written to 1. The DFLL clock should not be used by any modules until the DFLL locks are set.

If the application requires on-the-fly DFLL calibration (temperature/VCC drift compensation), the firmware should perform, either periodically or when the DFLL48M frequency differ too much from target frequency (indicated by DFLLVAL.DIFF), the following:

- o Switch system clock/module clocks to different clock than DFLL48M
- o Re-initiate a DFLL48M closed loop lock sequence by disabling and re-enabling the DFLL48M

o Wait for fine lock (PCLKSR.DFLLCKF set to 1)

o Switch back system clock/module clocks to the DFLL48M

Better accuracy is achieved using a high multiplier for the DFLL48M, using a scaled down or slow clock as reference. A multiplier of 6 will have a theoretical worst case frequency deviation from the reference clock of +/- 8.33%. A multiplier of 500 will have a theoretical worst case frequency deviation from the reference clock of +/- 0.1%.

**4 – If the DFLL48M reaches the maximum or minimum COARSE or FINE calibration values during the locking sequence, an out of bounds interrupt will be generated. These interrupts will be generated even if the final calibration values at DFLL48M lock are not at maximum or minimum, and might therefore be false out of bounds interrupts.**

**Errata reference: 10669**

**Fix/Workaround:**

Check that the lockbits: DFLLCKC and DFLLCKF in the SYSCTRL Interrupt Flag Status and Clear register (INTFLAG) are both set before enabling the DFLLOOB interrupt.

#### 36.1.2.7. XOSC32K

**1 – The automatic amplitude control of the XOSC32K does not work.**

**Errata reference: 10933**

**Fix/Workaround:**

Use the XOSC32K with Automatic Amplitude control disabled (XOSC32K.AAMPEN = 0)

#### 36.1.2.8. EIC

**1 – When the EIC is configured to generate an interrupt on a low level or rising edge or both edges (CONFIGn.SENSEx) with the filter enabled (CONFIGn.FILTENx), a spurious flag might appear for the dedicated pin on the INTFLAG.EXTINT[x] register as soon as the EIC is enabled using CTRLA ENABLE bit.**

**Errata reference: 15341**

**Fix/Workaround:**

Clear the INTFLAG bit once the EIC enabled and before enabling the interrupts.

#### 36.1.2.9. NVMCTRL

**1 – Default value of MANW in NVM.CTRLB is 0.**

**This can lead to spurious writes to the NVM if a data write is done through a pointer with a wrong address corresponding to NVM area.**

**Errata reference: 13134**

**Fix/Workaround:**

Set MANW in the NVM.CTRLB to 1 at startup

**2 – When external reset is active it causes a high leakage current on VDDIO.**

**Errata reference: 13446**

**Fix/Workaround:**

Minimize the time external reset is active.

**3 – When the part is secured and EEPROM emulation area configured to none, the CRC32 is not executed on the entire flash area but up to the on-chip flash size minus half a row.**

**Errata reference: 11988**

**Fix/Workaround:**

When using CRC32 on a protected device with EEPROM emulation area configured to none, compute the reference CRC32 value to the full chip flash size minus half row.

#### 36.1.2.10. EVSYS

**1 – Using synchronous or resynchronized paths, some channels (0,3,6,7) detect an overrun on every event even if no overrun condition is present.**

**Errata reference: 10895**

**Fix/Workaround:**

- Ignore overrun detection bit for channels 0,3,6,7.
- Use channels 1,2,4,5 if overrun detection is required.

**2 – Changing the selected generator of a channel can trigger a spurious interrupt/event.**

**Errata reference: 10443**

**Fix/Workaround:**

To change the generator of a channel, first write with EDGESEL written to zero, then perform a second write with EDGESEL written to its target value.

#### 36.1.2.11. SERCOM

**1 – The SERCOM SPI CTRLA register bit 17 (DOPO Bit 1) will always be zero, and cannot be changed. Therefore the SERCOM SPI cannot be switched between master and slave mode on the same DI and DO pins.**

**Errata reference: 10812**

**Fix/Workaround:**

Connect the alternate DI and DO pins externally and use the port MUX to switch between pin configurations for master and slave functionality.

**2 – When the SERCOM is in slave SPI mode, the BUFOVF flag is not automatically cleared when CTRLB.RXEN is set to zero.**

**Errata reference: 10563**

**Fix/Workaround:**

The BUFOVF flag must be manually cleared by software.

**3 – In TWI master mode, an ongoing transaction should be stalled immediately when DBGCTRL.DBGSTOP is set and the CPU enters debug mode. Instead, it is stopped when the current byte transaction is completed and the corresponding interrupt is triggered if enabled.**

**Errata reference: 12499**

**Fix/Workaround:**

In TWI master mode, keep DBGCTRL.DBGSTOP=0 when in debug mode.

**4 – The SERCOM SPI BUFOVF status bit is not set until the next character is received after a buffer overflow, instead of directly after the overflow has occurred. Furthermore the CTRLA.IBON bit will always be zero and cannot be changed.**

**Errata reference: 10551**

**Fix/Workaround:**

None.

#### 36.1.2.12. TC

**1 – Spurious TC overflow and Match/Capture events may occur.**

**Errata reference: 13268**

**Fix/Workaround:**

Do not use the TC overflow and Match/Capture events. Use the corresponding Interrupts instead.

#### 36.1.2.13. ADC

**1 – When the ADC bus clock frequency(CLK\_ADC\_APB) is smaller than the ADC asynchronous clock frequency(GCLK\_ADC), issuing an ADC SWRST (ADC.CTRLA.SWRST) will lock up the ADC with the SYNCBUSY (ADC.STATUS.SYNCBUSY) flag always set.**

**Errata reference: 10987**

**Fix/Workaround:**

Do not issue an ADC SWRST if the ADC bus clock frequency (CLK\_ADC\_APB) is smaller than the ADC asynchronous clock frequency(GCLK\_ADC).

**2 – The automatic right shift of the result when accumulating/averaging ADC samples does not work.**

**Errata reference: 10530**

**Fix/Workaround:**

To accumulate or average more than 16 samples, one must add the number of automatic right shifts to AVGCTRL.ADJRES to perform the correct number of right shifts. For example, for averaging 128 samples, AVGCTRL.ADJRES must be written to 7 instead of 4, as the automatic right shift of 3 is not done. For oversampling to 16 bits resolution, AVGCTRL.ADJRES must be written to 4 instead of 0 as the automatic right shift of 4 is not done.

The maximum number of right shifts that can be done using ADJRES is 7. This means that when averaging more than 128 samples, the result will be more than 12 bits, and the additional right shifts to get the result down to 12 bits must be done by firmware.

#### 36.1.2.14. BOD33

**1 – The BOD33 HYST bit is not updated from NVM user row at power on. The reset value of this bit is zero.**

**Errata reference: 10565**

**Fix/Workaround:**

None.

#### 36.1.2.15. BOD12

**1 – The BOD12 HYST bit is not updated from NVM user row at power on. The reset value of this bit is zero.**

**Errata reference: 10568**

**Fix/Workaround:**

None.

#### 36.1.2.16. PTC

**1 – WCOMP interrupt flag is not stable. The WCOMP interrupt flag will not always be set as described in the datasheet.**

**Errata reference: 12860**

**Fix/Workaround:**

Do not use the WCOMP interrupt. Use the WCOMP event.

### 36.1.3. Die Revision D

#### 36.1.3.1. Device

**1 – When VDDIN is lower than the POR threshold during power rise or fall, an internal pull-up resistor is enabled on pins with PTC functionality (see PORT Function Multiplexing). Note that this behavior will be present even if PTC functionality is not enabled on the pin. The POR level is defined in the “Power-On Reset (POR) Characteristics” chapter.**

**Errata reference: 10805**

**Fix/Workaround:**

Use a pin without PTC functionality if the pull-up could damage your application during power up.

**2 – In the table ""NVM User Row Mapping"", the WDT Window bitfield default value on silicon is not as specified in the datasheet. The datasheet defines the default value as 0x5, while it is 0xB on silicon.**

**Errata reference: 13951**

**Fix/Workaround:**

None.

**3 – Clock Failure detection for external OSC does not work in standby mode.**

**Errata reference: 12688**

**Fix/Workaround:**

Before entering standby mode, move the CPU clock to an internal RC, disable external OSC and disable the Clock Failure detector. Upon CPU wakeup, restart external OSC (if it does not start, the failure occurred during standby), enable the Clock Failure detector and move the CPU clock to the external OSC.

**4 – In single shot mode and at 105°C, the ADC conversions have linearity errors.**

**Errata reference: 13276**

**Fix/Workaround:**

- Workaround 1: At 105°C, do not use the ADC in single shot mode; use the ADC in free running mode only.
- Workaround 2: At 105°C, use the ADC in single shot mode only with VDDANA > 2.7V.

**5 – If APB clock is stopped and GCLK clock is running, APB read access to read-synchronized registers will freeze the system. The CPU and the DAP AHB-AP are stalled, as a consequence debug operation is impossible.**

**Errata reference: 10416**

**Fix/Workaround:**

Do not make read access to read-synchronized registers when APB clock is stopped and GCLK is running. To recover from this situation, power cycle the device or reset the device using the RESETN pin.

**6 – The SYSTICK calibration value is incorrect.**

**Errata reference: 14153**

**Fix/Workaround:**

The correct SYSTICK calibration value is 0x40000000. This value should not be used to initialize the Systick RELOAD value register, which should be initialized instead with a value depending on the main clock frequency and on the tick period required by the application. For a detailed description of the SYSTICK module, refer to the official ARM Cortex-M0+ documentation.

**7 – In the table ""NVM User Row Mapping"", bits 40 & 41 default values on silicon are not as specified in the datasheet. The datasheet defines the default value as 0, it is 1 for both bits on silicon.**

**Errata reference: 13950**

**Fix/workaround:**

None.

**8 – In I2C Slave mode, writing the CTRLB register when in the AMATCH or DRDY interrupt service routines can cause the state machine to reset.**

**Errata reference: 13574**

**Fix/Workaround:**

Write CTRLB.ACKACT to 0 using the following sequence:

// If higher priority interrupts exist, then disable so that the  
// following two writes are atomic.

SERCOM - STATUS.reg = 0;

SERCOM - CTRLB.reg = 0;

// Re-enable interrupts if applicable.

Write CTRLB.ACKACT to 1 using the following sequence:

// If higher priority interrupts exist, then disable so that the  
// following two writes are atomic.

SERCOM - STATUS.reg = 0;

SERCOM - CTRLB.reg = SERCOM\_I2CS\_CTRLB\_ACKACT;

// Re-enable interrupts if applicable.

Otherwise, only write to CTRLB in the AMATCH or DRDY interrupts if it is to close out a transaction.

When not closing a transaction, clear the AMATCH interrupt by writing a 1 to its bit position instead of using CTRLB.CMD. The DRDY interrupt is automatically cleared by reading/writing to the DATA register in smart mode. If not in smart mode, DRDY should be cleared by writing a 1 to its bit position.

Code replacements examples:

Current:

SERCOM - CTRLB.reg |= SERCOM\_I2CS\_CTRLB\_ACKACT;

Change to:

// If higher priority interrupts exist, then disable so that the  
// following two writes are atomic.

SERCOM - STATUS.reg = 0;

SERCOM - CTRLB.reg = SERCOM\_I2CS\_CTRLB\_ACKACT;

// Re-enable interrupts if applicable.

Current:

SERCOM - CTRLB.reg &= ~SERCOM\_I2CS\_CTRLB\_ACKACT;

Change to:

// If higher priority interrupts exist, then disable so that the  
// following two writes are atomic.

SERCOM - STATUS.reg = 0;

SERCOM - CTRLB.reg = 0;

// Re-enable interrupts if applicable.

Current:

/\* ACK or NACK address \*/

SERCOM - CTRLB.reg |= SERCOM\_I2CS\_CTRLB\_CMD(0x3);

Change to:

// CMD=0x3 clears all interrupts, so to keep the result similar,  
// PREC is cleared if it was set.

if (SERCOM - INTFLAG.bit.PREC) SERCOM - INTFLAG.reg =

SERCOM\_I2CS\_INTFLAG\_PREC;

SERCOM - INTFLAG.reg = SERCOM\_I2CS\_INTFLAG\_AMATCH;

**9 – The voltage regulator in low power mode is not functional at temperatures above 85C.**

**Errata reference: 12290**

**Fix/Workaround:**

Enable normal mode on the voltage regulator in standby sleep mode.

Example code:

```
// Set the voltage regulator in normal mode configuration in standby sleep mode
```

```
SYSCTRL->VREG.bit.RUNSTDBY = 1;
```

**10 – After a clock failure detection (INTFLAG.CFD = 1), if INTFLAG.CFD is cleared while the clock is still broken, the system is stuck.**

**Errata reference: 12687**

**Fix/Workaround:**

After a clock failure detection, do not clear INTFLAG.CFD or perform a system reset.

**11 – In Standby, Idle1 and Idle2 sleep modes the device might not wake up from sleep. An External Reset, Power on Reset or Watch Dog Reset will start the device again.**

**Errata reference: 13140**

**Fix/Workaround:**

the SLEEP prm bits in the NVMCTRL.CTRLB register must be written to 3 (NVMCTRL - CTRLB.bit.SLEEP prm = 3) to ensure correct operation of the device. The average power consumption of the device will increase with 20uA compared to numbers in the electrical characteristics chapter.

**12 – Digital pin outputs from Timer/Counters, AC (Analog Comparator), GCLK (Generic Clock Controller), and SERCOM (I2C and SPI) do not change value during standby sleep mode.**

**Errata reference: 12537**

**Fix/Workaround:**

Set the voltage regulator in Normal mode before entering STANDBY sleep mode in order to keep digital pin output enabled. This is done by setting the RUNSTDBY bit in the VREG register.

**13 – If the external XOSC32K is broken, neither the external pin RST nor the GCLK software reset can reset the GCLK generators using XOSC32K as source clock.**

**Errata reference: 12164**

**Fix/Workaround:**

Do a power cycle to reset the GCLK generators after an external XOSC32K failure.

### 36.1.3.2. DSU

**1 – If a debugger has issued a DSU Cold-Plugging procedure and then released the CPU from the resulting ""CPU Reset Extension"", the CPU will be held in ""CPU Reset Extension"" after any upcoming reset event.**

**Errata reference: 12015**

**Fix/workaround:**

The CPU must be released from the ""CPU Reset Extension"" either by writing a one in the DSU STATUS.A.CRSTEXT register or by applying an external reset with SWCLK high or by power cycling the device.

**2 – The MBIST ""Pause-on-Error"" feature is not functional on this device.**

**Errata reference: 14324**

**Fix/Workaround:**

Do not use the ""Pause-on-Error"" feature.

#### 36.1.3.3. PM

**1 – In debug mode, if a watchdog reset occurs, the debug session is lost.**

**Errata reference: 12196**

**Fix/Workaround:**

A new debug session must be restart after a watchdog reset.

#### 36.1.3.4. DFLL48M

**1 – The DFLL clock must be requested before being configured otherwise a write access to a DFLL register can freeze the device.**

**Errata reference: 9905**

**Fix/Workaround:**

Write a zero to the DFLL ONDEMAND bit in the DFLLCTRL register before configuring the DFLL module.

**2 – If the DFLL48M reaches the maximum or minimum COARSE or FINE calibration values during the locking sequence, an out of bounds interrupt will be generated. These interrupts will be generated even if the final calibration values at DFLL48M lock are not at maximum or minimum, and might therefore be false out of bounds interrupts.**

**Errata reference: 10669**

**Fix/Workaround:**

Check that the lockbits: DFLLCKC and DFLLCKF in the SYSCTRL Interrupt Flag Status and Clear register (INTFLAG) are both set before enabling the DFLLOOB interrupt.

#### 36.1.3.5. XOSC32K

**1 – The automatic amplitude control of the XOSC32K does not work.**

**Errata reference: 10933**

**Fix/Workaround:**

Use the XOSC32K with Automatic Amplitude control disabled (XOSC32K.AAMPEN = 0)

#### 36.1.3.6. EIC

**1 – When the EIC is configured to generate an interrupt on a low level or rising edge or both edges (CONFIGn.SENSEx) with the filter enabled (CONFIGn.FILTENx), a spurious flag might appear for the dedicated pin on the INTFLAG.EXTINT[x] register as soon as the EIC is enabled using CTRLA ENABLE bit.**

**Errata reference: 15341**

**Fix/Workaround:**

Clear the INTFLAG bit once the EIC enabled and before enabling the interrupts.

#### 36.1.3.7. NVMCTRL

**1 – Default value of MANW in NVM.CTRLB is 0.**

**This can lead to spurious writes to the NVM if a data write is done through a pointer with a wrong address corresponding to NVM area.**

**Errata reference: 13134**

**Fix/Workaround:**

Set MANW in the NVM.CTRLB to 1 at startup

**2 – When external reset is active it causes a high leakage current on VDDIO.**

**Errata reference: 13446**

**Fix/Workaround:**

Minimize the time external reset is active.

**3 – When the part is secured and EEPROM emulation area configured to none, the CRC32 is not executed on the entire flash area but up to the on-chip flash size minus half a row.**

**Errata reference: 11988**

**Fix/Workaround:**

When using CRC32 on a protected device with EEPROM emulation area configured to none, compute the reference CRC32 value to the full chip flash size minus half row.

#### 36.1.3.8. SERCOM

**1 – In TWI master mode, an ongoing transaction should be stalled immediately when DBGCTRL.DBGSTOP is set and the CPU enters debug mode. Instead, it is stopped when the current byte transaction is completed and the corresponding interrupt is triggered if enabled.**

**Errata reference: 12499**

**Fix/Workaround:**

In TWI master mode, keep DBGCTRL.DBGSTOP=0 when in debug mode.

#### 36.1.3.9. TC

**1 – Spurious TC overflow and Match/Capture events may occur.**

**Errata reference: 13268**

**Fix/Workaround:**

Do not use the TC overflow and Match/Capture events. Use the corresponding Interrupts instead.

#### 36.1.3.10. PTC

**1 – WCOMP interrupt flag is not stable. The WCOMP interrupt flag will not always be set as described in the datasheet.**

**Errata reference: 12860**

**Fix/Workaround:**

Do not use the WCOMP interrupt. Use the WCOMP event.

### 36.1.4. Die Revision E

#### 36.1.4.1. Device

**1 – In the table ""NVM User Row Mapping"", the WDT Window bitfield default value on silicon is not as specified in the datasheet. The datasheet defines the default value as 0x5, while it is 0xB on silicon.**

**Errata reference: 13951**

**Fix/Workaround:**

None.

**2 – Clock Failure detection for external OSC does not work in standby mode.**

**Errata reference: 12688**

**Fix/Workaround:**

Before entering standby mode, move the CPU clock to an internal RC, disable external OSC and disable the Clock Failure detector. Upon CPU wakeup, restart external OSC (if it does not start, the failure occurred during standby), enable the Clock Failure detector and move the CPU clock to the external OSC.

**3 – In single shot mode and at 105°C, the ADC conversions have linearity errors.**

**Errata reference: 13276**

**Fix/Workaround:**

- Workaround 1: At 105°C, do not use the ADC in single shot mode; use the ADC in free running mode only.
- Workaround 2: At 105°C, use the ADC in single shot mode only with VDDANA > 2.7V.

**4 – If APB clock is stopped and GCLK clock is running, APB read access to read-synchronized registers will freeze the system. The CPU and the DAP AHB-AP are stalled, as a consequence debug operation is impossible.**

**Errata reference: 10416**

**Fix/Workaround:**

Do not make read access to read-synchronized registers when APB clock is stopped and GCLK is running. To recover from this situation, power cycle the device or reset the device using the RESETN pin.

**5 – The SYSTICK calibration value is incorrect.**

**Errata reference: 14153**

**Fix/Workaround:**

The correct SYSTICK calibration value is 0x40000000. This value should not be used to initialize the Systick RELOAD value register, which should be initialized instead with a value depending on the main clock frequency and on the tick period required by the application. For a detailed description of the SYSTICK module, refer to the official ARM Cortex-M0+ documentation.

**6 – In the table ""NVM User Row Mapping"", bits 40 & 41 default values on silicon are not as specified in the datasheet. The datasheet defines the default value as 0, it is 1 for both bits on silicon.**

**Errata reference: 13950**

**Fix/workaround:**

None.

**7 – In I2C Slave mode, writing the CTRLB register when in the AMATCH or DRDY interrupt service routines can cause the state machine to reset.**

**Errata reference: 13574**

**Fix/Workaround:**

Write CTRLB.ACKACT to 0 using the following sequence:

// If higher priority interrupts exist, then disable so that the  
// following two writes are atomic.

SERCOM - STATUS.reg = 0;

```

SERCOM - CTRLB.reg = 0;
// Re-enable interrupts if applicable.
Write CTRLB.ACKACT to 1 using the following sequence:
// If higher priority interrupts exist, then disable so that the
// following two writes are atomic.
SERCOM - STATUS.reg = 0;
SERCOM - CTRLB.reg = SERCOM_I2CS_CTRLB_ACKACT;
// Re-enable interrupts if applicable.
Otherwise, only write to CTRLB in the AMATCH or DRDY interrupts if it is to
close out a transaction.
When not closing a transaction, clear the AMATCH interrupt by writing a 1 to
its bit position instead of using CTRLB.CMD. The DRDY interrupt is
automatically cleared by reading/writing to the DATA register in smart mode.
If not in smart mode, DRDY should be cleared by writing a 1 to its bit
position.
Code replacements examples:
Current:
SERCOM - CTRLB.reg |= SERCOM_I2CS_CTRLB_ACKACT;
Change to:
// If higher priority interrupts exist, then disable so that the
// following two writes are atomic.
SERCOM - STATUS.reg = 0;
SERCOM - CTRLB.reg = SERCOM_I2CS_CTRLB_ACKACT;
// Re-enable interrupts if applicable.
Current:
SERCOM - CTRLB.reg &= ~SERCOM_I2CS_CTRLB_ACKACT;
Change to:
// If higher priority interrupts exist, then disable so that the
// following two writes are atomic.
SERCOM - STATUS.reg = 0;
SERCOM - CTRLB.reg = 0;
// Re-enable interrupts if applicable.
Current:
/* ACK or NACK address */
SERCOM - CTRLB.reg |= SERCOM_I2CS_CTRLB_CMD(0x3);
Change to:
// CMD=0x3 clears all interrupts, so to keep the result similar,
// PREC is cleared if it was set.
if (SERCOM - INTFLAG.bit.PREC) SERCOM - INTFLAG.reg =
SERCOM_I2CS_INTFLAG_PREC;
SERCOM - INTFLAG.reg = SERCOM_I2CS_INTFLAG_AMATCH;

8 – The voltage regulator in low power mode is not functional at
temperatures above 85C.
Errata reference: 12290
Fix/Workaround:
Enable normal mode on the voltage regulator in standby sleep mode.
Example code:
// Set the voltage regulator in normal mode configuration in standby sleep
mode
SYSCTRL->VREG.bit.RUNSTDBY = 1;

```

**9 – After a clock failure detection (INTFLAG.CFD = 1), if INTFLAG.CFD is cleared while the clock is still broken, the system is stuck.**

**Errata reference: 12687**

**Fix/Workaround:**

After a clock failure detection, do not clear INTFLAG.CFD or perform a system reset.

**10 – If the external XOSC32K is broken, neither the external pin RST nor the GCLK software reset can reset the GCLK generators using XOSC32K as source clock.**

**Errata reference: 12164**

**Fix/Workaround:**

Do a power cycle to reset the GCLK generators after an external XOSC32K failure.

#### 36.1.4.2. DSU

**1 – The MBIST ""Pause-on-Error"" feature is not functional on this device.**

**Errata reference: 14324**

**Fix/Workaround:**

Do not use the ""Pause-on-Error"" feature.

#### 36.1.4.3. DFLL48M

**1 – The DFLL clock must be requested before being configured otherwise a write access to a DFLL register can freeze the device.**

**Errata reference: 9905**

**Fix/Workaround:**

Write a zero to the DFLL ONDEMAND bit in the DFLLCTRL register before configuring the DFLL module.

**2 – If the DFLL48M reaches the maximum or minimum COARSE or FINE calibration values during the locking sequence, an out of bounds interrupt will be generated. These interrupts will be generated even if the final calibration values at DFLL48M lock are not at maximum or minimum, and might therefore be false out of bounds interrupts.**

**Errata reference: 10669**

**Fix/Workaround:**

Check that the lockbits: DFLLCKC and DFLLCKF in the SYSCTRL Interrupt Flag Status and Clear register (INTFLAG) are both set before enabling the DFLLOOB interrupt.

#### 36.1.4.4. XOSC32K

**1 – The automatic amplitude control of the XOSC32K does not work.**

**Errata reference: 10933**

**Fix/Workaround:**

Use the XOSC32K with Automatic Amplitude control disabled (XOSC32K.AAMPEN = 0)

#### 36.1.4.5. EIC

**1 – When the EIC is configured to generate an interrupt on a low level or rising edge or both edges (CONFIGn.SENSEx) with the filter enabled (CONFIGn.FILTENx), a spurious flag might appear for the dedicated pin**

**on the INTFLAG.EXTINT[x] register as soon as the EIC is enabled using CTRLA ENABLE bit.**

**Errata reference: 15341**

**Fix/Workaround:**

Clear the INTFLAG bit once the EIC enabled and before enabling the interrupts.

#### 36.1.4.6. NVMCTRL

**1 – Default value of MANW in NVM.CTRLB is 0.**

**This can lead to spurious writes to the NVM if a data write is done through a pointer with a wrong address corresponding to NVM area.**

**Errata reference: 13134**

**Fix/Workaround:**

Set MANW in the NVM.CTRLB to 1 at startup

**2 – When external reset is active it causes a high leakage current on VDDIO.**

**Errata reference: 13446**

**Fix/Workaround:**

Minimize the time external reset is active.

#### 36.1.4.7. SERCOM

**1 – In TWI master mode, an ongoing transaction should be stalled immediately when DBGCTRL.DBGSTOP is set and the CPU enters debug mode. Instead, it is stopped when the current byte transaction is completed and the corresponding interrupt is triggered if enabled.**

**Errata reference: 12499**

**Fix/Workaround:**

In TWI master mode, keep DBGCTRL.DBGSTOP=0 when in debug mode.

## 37. Datasheet Revision History

The referring page numbers in this section are referred to this datasheet. The referring revision in this section are referring to the datasheet revision.

### 37.1. Rev. P - 09/2016

Memories	Updated the BOOTPROT default value in <a href="#">NVM User Row Mapping</a> : default value = 0x7 except for WLCSP that has default value = 0x3
DSU - Device Service Unit	Updated the Registers "Reset Value"
Clock System	Added the section: <a href="#">Disabling a Peripheral</a>
SYSCTRL – System Controller	Description added on setting up AMPGC bit in <a href="#">XOSC</a> register
EVSYS – Event System	<a href="#">CTRL.SWRST</a> : Added recommendation when doing a software reset
RTC – Real-Time Counter	Updated the description in <a href="#">Clock/Calendar (Mode 2)</a> : Example added on how the clock counter works in calendar mode
TC – Timer/Counter	The ENABLE and SWRST bits in <a href="#">CTRLA</a> register are not enable protected
Schematic Checklist	Updated <a href="#">External Real Time Oscillator</a> : Added note on how to minimize jitter
Electrical Characteristics at 85°C	<ul style="list-style-type: none"><li>• Editing update</li><li>• Updated <a href="#">General Operating Ratings</a><ul style="list-style-type: none"><li>– Added note about the NVM erase operations in debugger cold-plugging mode</li></ul></li><li>• Updated <a href="#">Crystal Oscillator Characteristics</a><ul style="list-style-type: none"><li>– Removed the package condition from the <a href="#">Table 33-39</a></li></ul></li></ul>
Electrical Characteristics at 105°C	<ul style="list-style-type: none"><li>• – Updated <a href="#">Injection Current</a></li><li>• Updated <a href="#">General Operating Ratings</a><ul style="list-style-type: none"><li>– Added note about the NVM erase operations in debugger cold-plugging mode</li></ul></li><li>• Updated <a href="#">Crystal Oscillator Characteristics</a><ul style="list-style-type: none"><li>– Removed the package condition from the <a href="#">Table 33-39</a></li></ul></li></ul>

### 37.2. Rev. O - 08/2016

Description	Description: Updated CoreMark score from 2.14 to 2.46 CoreMark/MHz.
Block Diagram	Updated <a href="#">Block Diagram</a> .
Power Manager	Updated description for bits [31:4] in <a href="#">APBBMASK</a> .
System Control	Updated description in Drift Compensation.

Electrical Characteristics	<b>Brown-Out Detectors Characteristics:</b> Updated <a href="#">Table 33-18</a> . <b>Digital Frequency Locked Loop (DFLL48M) Characteristics:</b> Note 2 in <a href="#">Table 33-40</a> updated to only be applicable for die revision C.
Schematic Checklist	Updated the content in section <i>Unused or Unconnected Pins</i> . <i>Power Supply Schematic:</i> $V_{DDCORE}$ decoupling capacitor value updated from 100nF to 1nF.
Electrical Characteristics at 85°C	<ul style="list-style-type: none"> <li>• Updated <b>Absolute Maximum Ratings</b> <ul style="list-style-type: none"> <li>– <math>V_{pin}</math>: <b>min</b> and <b>max</b> changed respectively from <i>GND</i>-0.3V to <i>GND</i>-0.6V and from <i>GND</i>+0.3V to <i>GND</i>+0.6V</li> </ul> </li> <li>• Added <b>Injection Current</b></li> </ul>
Electrical Characteristics at 105°C	<ul style="list-style-type: none"> <li>• Updated <b>Absolute Maximum Ratings</b> <ul style="list-style-type: none"> <li>– <math>V_{pin}</math>: <b>min</b> and <b>max</b> changed respectively from <i>GND</i>-0.3V to <i>GND</i>-0.6V and from <i>GND</i>+0.3V to <i>GND</i>+0.6V</li> </ul> </li> <li>• – Added <b>Injection Current</b></li> <li>• <b>BOD33:</b> Updated <a href="#">Table 33-19</a>.</li> </ul>

### 37.3. Rev. N - 01/2015

Electrical Characteristics	<ul style="list-style-type: none"> <li>• Updated <a href="#">Table 33-20</a> in the <b>Analog-to-Digital (ADC) Characteristics</b> <ul style="list-style-type: none"> <li>– added two rows. One for Internal ratiometric reference 0 error and the other for Internal ratiometric reference 1 error</li> <li>– added more details in Conditions of <math>V_{REFINTVCC0}</math> and <math>V_{REFINTVCC1}</math></li> </ul> </li> </ul>
Errata	<ul style="list-style-type: none"> <li>• Added Errata revision E</li> <li>• Updated Errata revision D: <ul style="list-style-type: none"> <li>– Added new Errata references: 12290; 13950 and 13951</li> <li>– Updated Errata reference 13574: The software workaround: In I2C Slave mode, writing the CTRLB register when in the AMATCH or DRDY interrupt service routines can cause the state machine to reset</li> <li>– Updated Errata reference 13276 Workaround 2: At 105°C, use the ADC in single shot mode only with <math>VDDANA &gt; 2.7V</math></li> </ul> </li> <li>• Updated Errata revision C: <ul style="list-style-type: none"> <li>– Added new Errata reference:13951</li> <li>– Updated Errata reference 10537</li> </ul> </li> <li>• Updated Errata revision B: <ul style="list-style-type: none"> <li>– Added new Errata reference:13951</li> </ul> </li> </ul>
Appendix	<ul style="list-style-type: none"> <li>• Added <a href="#">Appendix A: Electrical Characteristics at 105°C</a></li> </ul>

## 37.4. Rev. M - 12/2014

Signal Description List	<ul style="list-style-type: none"> <li>VREFP renamed VREFA and VREFB in the <a href="#">Signal Descriptions List</a></li> </ul>
Memories	<ul style="list-style-type: none"> <li>Added a table note to the <a href="#">Table 10-4</a></li> </ul>
DSU - Device Service Unit	<ul style="list-style-type: none"> <li>Updated the <i>Register Summary</i> <ul style="list-style-type: none"> <li>Added register bit <i>AMOD[1:0]</i></li> </ul> </li> <li>Updated the register <i>ADDR</i> <ul style="list-style-type: none"> <li>Added the description of “Bits 1:0 – AMOD[1:0]”</li> </ul> </li> </ul>
System Controller	<ul style="list-style-type: none"> <li>Removed all references to 1khz from <a href="#">32kHz External Crystal Oscillator (XOSC32K) Operation</a>, <a href="#">32kHz Internal Oscillator (OSC32K) Operation</a> and <a href="#">32kHz Ultra Low Power Internal Oscillator (OSCLUP32K) Operation</a></li> <li>Changed EN1K bits to “Reserved” in <a href="#">XOSC32K</a> and in <a href="#">OSC32K</a></li> </ul>
PORT	<ul style="list-style-type: none"> <li>Updated <a href="#">I/O Pin Configuration</a> <ul style="list-style-type: none"> <li>Removed reference to <i>Open-drain</i></li> </ul> </li> </ul>
ADC - Analog-to-Digital Converter	<ul style="list-style-type: none"> <li>Replaced AREFA/AREFB by VREFA/VREFB in <a href="#">Analog Connections</a></li> </ul>
DAC - Digital -to-Analog Converter	<ul style="list-style-type: none"> <li>Replaced VREFP by VREFA in <a href="#">Digital to Analog Conversion</a> and in <a href="#">DAC as an Internal Reference</a></li> </ul>
Electrical Characteristics	<ul style="list-style-type: none"> <li><b>Brown-Out Detectors Characteristics:</b> <ul style="list-style-type: none"> <li>Added <a href="#">Figure 33-3</a>, <a href="#">Figure 33-4</a> and clarifications.</li> <li>Updated conditions in the <a href="#">Table 33-18</a> and in the <a href="#">Table 33-19</a>.</li> </ul> </li> <li><b>Analog-to-Digital (ADC) Characteristics:</b> <ul style="list-style-type: none"> <li>Updated conditions in the <a href="#">Table 33-23</a> and in the <a href="#">Table 33-24</a>.</li> </ul> </li> <li>Updated the table <a href="#">Table 33-40</a> in <a href="#">Digital Frequency Locked Loop (DFLL48M) Characteristics</a>: <ul style="list-style-type: none"> <li>Renamed “Power consumption on <math>V_{DDANA}</math>” to “Power consumption on <math>V_{DDIN}</math>”</li> <li>Added <math>I_{DFLL}</math> specific typical value for revD and later</li> </ul> </li> <li>Updated the table <a href="#">Table 33-45</a> in <a href="#">SERCOM in SPI Mode Timing</a>: <ul style="list-style-type: none"> <li>The value of <math>t_{SCK}</math> SCK period updated from 42 to 84</li> </ul> </li> </ul>
Package Information	<ul style="list-style-type: none"> <li>Updated <a href="#">Thermal Considerations</a>: <ul style="list-style-type: none"> <li>Added Theta<sub>JA</sub> and Theta<sub>J<sub>C</sub></sub> values for the packages: 64-ball UFBGA and 45-ball WLCSP</li> </ul> </li> </ul>
Schematic Checklist	<ul style="list-style-type: none"> <li>Updated the <a href="#">Introduction Content</a></li> <li>Replaced AREFA/AREFB by VREFA/VREFB in the content</li> <li>Updated the content in the <a href="#">Programming and Debug Ports</a> <ul style="list-style-type: none"> <li>Updated all sub-sections, tables and figures</li> </ul> </li> </ul>
Errata	<ul style="list-style-type: none"> <li>Updated Errata revision D: <ul style="list-style-type: none"> <li>Added Errata reference 13574 related to CTRLB register / I<sup>2</sup>C in Slave Mode.</li> </ul> </li> </ul>

## 37.5. Rev. L - 09/2014

Features	<ul style="list-style-type: none"> <li>Added UFBGA64 and WLCSP45 packages</li> <li>Introduced the 105°C devices</li> </ul>
Pinout	<ul style="list-style-type: none"> <li>Added two more pinouts: <a href="#">UFBGA64</a> and <a href="#">WLCSP45</a></li> </ul>
Configuration Summary	<ul style="list-style-type: none"> <li>Updated <a href="#">Configuration Summary</a> to include UFBGA64 and WLCSP45 packages</li> </ul>
Ordering Information	<ul style="list-style-type: none"> <li>Updated <a href="#">Ordering Information</a> to include UFBGA64, WLCSP45 packages and the ordering codes for 105°C devices</li> </ul>
Peripheral Configuration	<ul style="list-style-type: none"> <li>Updated <a href="#">Peripherals Configuration Summary</a> <ul style="list-style-type: none"> <li>Added one column “SleepWalking” in the <a href="#">Table 12-1</a></li> </ul> </li> </ul>
PM – Power Manager	<ul style="list-style-type: none"> <li>Updated the table note 1 of the <a href="#">Table 16-3</a></li> </ul>
System Controller	<ul style="list-style-type: none"> <li>Updated <a href="#">Interrupts</a> <ul style="list-style-type: none"> <li>Interrupt source “BOD33DET - BOD33 Detection” is an Asynchronous interrupt that can be used to wake-up the device from any sleep mode</li> </ul> </li> </ul>
Watchdog Timer	<ul style="list-style-type: none"> <li>Updated <a href="#">Always-On Mode</a> <ul style="list-style-type: none"> <li>Added conditions for which CTRL.ALWAYSON bit must never be set to one by software</li> </ul> </li> <li>Updated <a href="#">Interrupts</a> <ul style="list-style-type: none"> <li>Early Warning (EW) is an asynchronous interrupt that can be used to wake-up the device from any sleep mode</li> </ul> </li> </ul>
RTC – Real-Time Counter	<ul style="list-style-type: none"> <li>Updated the section <i>Interrupts</i> <ul style="list-style-type: none"> <li>Overflow (INTFLAG.OVF), Compare n (INTFLAG.CMPn), Alarm 0 (INTFLAG.ALARMn) and Synchronization Ready (INTFLAG.SYNCRDY) are all asynchronous and can be used to wake-up the device from any sleep mode</li> </ul> </li> </ul>
EIC – External Interrupt Controller	<ul style="list-style-type: none"> <li>Updated the section <i>Interrupts</i> <ul style="list-style-type: none"> <li>External interrupt pins (EXTINTx) and Non-maskable interrupt pin (NMI) are both asynchronous and can be used to wake-up the device from any sleep mode</li> </ul> </li> </ul>
PORT - I/O Pin Controller	<ul style="list-style-type: none"> <li>Updated the <i>Basic Operation</i> section <ul style="list-style-type: none"> <li>Instances “pad” changed to “pin”</li> <li>Edited the content in the section</li> </ul> </li> </ul>
EVSYS – Event System	<ul style="list-style-type: none"> <li>Updated the section <i>Interrupts</i> <ul style="list-style-type: none"> <li>Overrun Channel x (OVRx) and Event Detected Channel x (EVDx) are asynchronous and can be used to wake-up the device from any sleep mode</li> </ul> </li> <li>Updated the section <i>Sleep Mode Operations</i></li> </ul>

SERCOM USART	<ul style="list-style-type: none"> <li>Updated the section <i>Interrupts</i> <ul style="list-style-type: none"> <li>RXS, RXC, TXC and DRE interrupts are asynchronous and can be used to wake-up the device from any sleep mode.</li> </ul> </li> </ul>
ADC – Analog-to-Digital Converter	<ul style="list-style-type: none"> <li>Fix a typo in the description of the bitfield MUXPOS of the register INPUTCTRL</li> <li>Added more info to the table "Delay Gain" and about the propagation delay in sub-section 7.3 "Prescaler"</li> </ul>
Electrical Characteristics	<ul style="list-style-type: none"> <li>Updated the <i>Maximum Clock Frequencies</i> <ul style="list-style-type: none"> <li>Added the <i>Table 32-6</i></li> <li>Renamed the <i>Table 32-7</i> to "Maximum Peripheral Clock Frequencies" and updated the whole table content including the symbols and descriptions</li> </ul> </li> <li>Added the section <i>Peripheral Power Consumption</i></li> <li>Updated the section <i>I/O Pin Characteristics</i> <ul style="list-style-type: none"> <li>Updated the table <i>Table 32-11</i> For <math>t_{RISE}</math> and <math>t_{FALL}</math> added different load conditions depending on DVRSTR value</li> </ul> </li> <li>Updated <i>SERCOM in SPI Mode Timing</i> <ul style="list-style-type: none"> <li>Added typical <math>t_{SCK}</math> in the table <i>Table 32-44</i></li> </ul> </li> <li>Updated <i>Voltage Regulator Characteristics</i> <ul style="list-style-type: none"> <li>Added minimum value to the <math>C_{out}</math> parameter in the <i>Table 32-15</i></li> </ul> </li> <li>Updated <i>Digital Frequency Locked Loop (DFLL48M) Characteristics</i> <ul style="list-style-type: none"> <li>Renamed the <i>Table 32-39</i> to <i>DFLL48M Characteristics - Closed Loop Mode</i></li> <li>Updated the content and the table note of the <i>Table 32-39</i></li> </ul> </li> <li>Updated the <i>Analog-to-Digital (ADC) Characteristics</i> <ul style="list-style-type: none"> <li><i>Table 32-19. Operating Conditions</i> Updated <i>Single rate (single shot) maximum value</i> to 300 ksps Updated the table note 3</li> <li><i>Table 32-20 and Table 32-21:</i> Added definition of the gain accuracy parameter</li> </ul> </li> <li>Updated <i>Temperature Sensor Characteristics</i> <ul style="list-style-type: none"> <li>Updated the table <i>Table 32-29. Temperature Sensor Characteristics</i> Added temperature sensor accuracy parameters and its condition</li> </ul> </li> </ul>
Schematic Checklist	<ul style="list-style-type: none"> <li>Added link for the values of XIN32/XOUT32 pins parasitic capacitance in the <i>Table 32-38. 32kHz Crystal Oscillator Characteristics</i></li> </ul>
Package Information	<ul style="list-style-type: none"> <li>Added two more packages: 64UFBGA and 45WL CSP</li> </ul>
Errata	<ul style="list-style-type: none"> <li>Updated errata for revision B, C and D. Added errata references: 10805, 12015, 12499, 13140, 13140 and 13268</li> </ul>

### 37.6. Rev. K – 05/2014

Description	<ul style="list-style-type: none"> <li>Updated the content in the <i>Description</i></li> </ul>
Block Diagram	<ul style="list-style-type: none"> <li>VREFP on DAC renamed VREFA</li> </ul>

Memories	<ul style="list-style-type: none"> <li>Updated the table <i>NVM User Row Mapping</i> <ul style="list-style-type: none"> <li>Changed the WDT window default value, WINDOW_1 to 0x5</li> </ul> </li> </ul>
DSU - Device Service Unit	<ul style="list-style-type: none"> <li>Updated <i>DSU Chip Identification Method</i>: <ul style="list-style-type: none"> <li>“Family” renamed “Product family” and subfamily became “Product series”</li> </ul> </li> <li>Updated the protection state of the device in <i>Starting CRC32 Calculation</i></li> </ul>
SYSCTRL - System Controller	<ul style="list-style-type: none"> <li>Updated <i>8MHz Internal Oscillator (OSC8M) Operation</i> <ul style="list-style-type: none"> <li>Updated the description of writing to FRANGE and CALIB</li> </ul> </li> <li>Updated the table <i>Behavior of the Oscillators</i> <ul style="list-style-type: none"> <li>DFLL renamed DFLL48M</li> </ul> </li> <li>Added Note on how to enter standby mode in: <ul style="list-style-type: none"> <li><i>External Multipurpose Crystal Oscillator (XOSC) Operation</i></li> <li><i>32kHz External Crystal Oscillator (XOSC32K) Operation</i></li> </ul> </li> <li>Added <i>VREG</i> register <ul style="list-style-type: none"> <li>Added <i>VREG</i> register in <i>Register Summary</i></li> <li>Updated the description of Bit 6 – RUNSTDBY and Bit 13 – FORCELDO</li> </ul> </li> <li>Updated the description of <i>Interrupts</i></li> <li>Updated <i>OSC8M</i> <ul style="list-style-type: none"> <li>Bits 11:0 - CALIB has two calibration fields CALIB[11-6] and CALIB[5:0]</li> </ul> </li> </ul>
RTC - Real-Time Counter	<ul style="list-style-type: none"> <li>Updated <i>Analog Connections</i> <ul style="list-style-type: none"> <li>TOSC1 and TOSC2 renamed respectively XIN32 and XOUT32</li> </ul> </li> </ul>
PORT	<ul style="list-style-type: none"> <li>Updated <i>Principle of Operation</i> <ul style="list-style-type: none"> <li>The reference for Pin Configuration registers changed to PINCFGy</li> </ul> </li> </ul>
SERCOM SPI	<ul style="list-style-type: none"> <li>Updated <i>CTRLB</i> register <ul style="list-style-type: none"> <li>Bit 17 - RXEN is R/W</li> </ul> </li> </ul>
TC - Timer/Counter	<ul style="list-style-type: none"> <li>Updated the table <i>Waveform Generation Operation</i></li> <li>Updated <i>CTRLC</i> register <ul style="list-style-type: none"> <li>Bits 1:0 - INVENx: Waveform Output x Invert Enable</li> </ul> </li> </ul>
AC - Analog Comparators	<ul style="list-style-type: none"> <li>Added Bit 7 - LPMUX in <i>CTRLA</i> register and updated <i>Register Summary</i></li> </ul>
DAC - Digital -to-Analog Converter	<ul style="list-style-type: none"> <li>Added a new DAC in the <i>Block Diagram</i> with VREFP replaced by VREFA</li> <li>Updated <i>Signal Description</i> <ul style="list-style-type: none"> <li>VREFP renamed VREFA</li> </ul> </li> </ul>

Electrical Characteristics	<ul style="list-style-type: none"> <li>• Updated the table <i>Absolute maximum ratings</i> <ul style="list-style-type: none"> <li>— Updated <math>I_{VDD}</math> and <math>I_{GND}</math> max values</li> <li>— Added a detailed table note for <math>I_{VDD}</math> and <math>I_{GND}</math></li> </ul> </li> <li>• Added the table <i>GPIO Clusters</i></li> <li>• Updated the table <i>General operating conditions</i> <ul style="list-style-type: none"> <li>— Removed table note (1) related to the operating conditions</li> </ul> </li> <li>• Updated the table <i>Current Consumption</i> <ul style="list-style-type: none"> <li>— Updated values in ACTIVE and IDLE0/1/2 modes</li> <li>— Updated the max values @ 85°C in STANDBY modes</li> <li>— I Max values updated to 100µA both for RTC stopped and RTC running</li> </ul> </li> <li>• Updated <i>I/O Pin Characteristics</i> section <ul style="list-style-type: none"> <li>— Updated title of the table to <i>RevD and later normal I/O Pins Characteristics</i></li> <li>— Updated <math>I_{OL}</math> and <math>I_{OH}</math> values in the table <i>RevD and later normal I/O Pins Characteristics</i></li> <li>— Updated <math>I_{OL}</math> and <math>I_{OH}</math> in the table <i><math>I^2C</math> Pins Characteristics in <math>I^2C</math> configuration</i></li> </ul> </li> <li>• Table note (1) on <math>C_{OUT}</math> removed from the table <i>Decoupling requirements</i></li> <li>• Updated the content in <i>Analog Characteristics</i> <ul style="list-style-type: none"> <li>— Updated max value of <math>V_{POT}</math> in the table <i>POR Characteristics</i>. New max value is 1.32V</li> <li>— Updated table note 3 in <i>Differential Mode</i></li> <li>— Updated table note 2 in <i>Single-Ended Mode</i></li> <li>— Updated <math>R_{SAMPLE}</math> in the table <i>Operating Conditions</i></li> </ul> </li> <li>• Added conversion rate for max 1000ksps in the table <i>Clock and Timing</i></li> <li>• Updated the table <i>Accuracy Characteristics</i> <ul style="list-style-type: none"> <li>— Added table note "All values measured using a conversion rate of 350ksps"</li> </ul> </li> <li>• Updated <i>Software-based Refinement of the Actual Temperature</i> <ul style="list-style-type: none"> <li>— Added the address of the temperature log row</li> </ul> </li> <li>• Updated the table <i>DFLL48M Characteristics - Closed Loop Mode</i> <ul style="list-style-type: none"> <li>— Removed the <math>T_{coarse}</math> parameter as it is already set from calibration</li> <li>— Updated <math>I_{DFLL}</math> and <math>t_{STARTU}</math> typical values</li> </ul> </li> <li>• Updated <i>Crystal Oscillator Characteristics</i> section: <ul style="list-style-type: none"> <li>— Updated the max values of ESR</li> <li>— Updated the typical values of <math>C_{XIN}</math> and <math>C_{XOUT}</math></li> </ul> </li> <li>• Updated the table <i>32kHz Crystal Oscillator Characteristics</i>: <ul style="list-style-type: none"> <li>— Updated the table note</li> </ul> </li> <li>• Updated the max value of ESR to 141kΩ, the typical values of <math>C_{XIN32}</math> and <math>C_{XOUT32}</math> to respectively 3.1 and 3.3pF</li> <li>• Updated the table <i><math>I^2C</math> Interface Timing</i> <ul style="list-style-type: none"> <li>— Added table note (3) to <math>t_R</math> and <math>t_{OF}</math></li> </ul> </li> </ul>
ERRATA	<ul style="list-style-type: none"> <li>• Added Errata Revision D</li> <li>• Updated Errata Revision C</li> <li>• Updated Errata Revision B</li> </ul>

### 37.7. Rev. J – 12/2013

NVMCTRL - Non-Volatile Memory Controller	Updated the NVM NVMCTRL.CTRLB register.
--	---

### 37.8. Rev. I 12/2013

General	Removed <i>Preliminary</i>
Description	<ul style="list-style-type: none"> <li>Updated the description</li> </ul>
Features	<ul style="list-style-type: none"> <li>Power Consumption has been updated to <i>Down to 8µA running the Peripheral Touch Controller</i></li> </ul>
Configuration Summary	Updated the <i>Configuration Summary</i>
Ordering Information	<p>Updated <i>Ordering Information</i></p> <ul style="list-style-type: none"> <li>Added AT prefix at the start of the ordering codes</li> </ul>
Block Diagram	<ul style="list-style-type: none"> <li>Added the description of the connection between PORT and ARM CORTEX-M0+ CPU: ARM SINGLE CYCLE IOBUS</li> <li>Renamed GENERIC CLOCK to GENERIC CLOCK CONTROLLER</li> </ul>
I/O Multiplexing and Considerations	<p>Updated the <i>Table 5-1. PORT Function Multiplexing</i></p> <ul style="list-style-type: none"> <li>Renamed all GCLK/IO[x] to GCLK_IO[x]</li> <li>Updated the description of the <i>Serial Wire Debug Interface Pinout</i> section</li> <li>Added SWDIO to PA31 column G in the <i>Table 5-1</i> and added a footnote</li> </ul>
Product Mapping	Changed Peripheral to AHB-APB
Signal Description	<ul style="list-style-type: none"> <li>Removed GCLK from the heading “Generic Clock Generator”</li> <li>Renamed IO[7:0] to GCLK_IO[7:0]</li> </ul>
Memories	<ul style="list-style-type: none"> <li>Added a new section <i>Serial Number</i></li> <li>Software Calibration Row changed to Software Calibration Area</li> <li>Added <i>Figure 9-1. Calibration and Auxiliary space</i></li> <li>Updated the <i>Table 9-4. NVM Software Calibration Area Mapping</i> <ul style="list-style-type: none"> <li>Added the BOD33 and BOD12 default settings</li> <li>Added DFLL48M COARSE CAL and DFLL48M FINE CAL</li> <li>Added table notes on rev C (Bit 40 and Bit 41) to the <i>Table 9-3. NVM User Row Mapping</i></li> </ul> </li> </ul>
DSU - Device Service Unit	<ul style="list-style-type: none"> <li>Updated the <i>Table 12-7. Register Summary</i> <ul style="list-style-type: none"> <li>Redefined DID register. FAMILY changed from 4 bits to 5 bits and SERIES from 8 bits to 6 bits</li> </ul> </li> <li>Updated the <i>Device Identification- DID</i> register <ul style="list-style-type: none"> <li>Updated Family and Series bit registers</li> <li>Updated the <i>Table 12-8. Device Selection</i>. Added ATSAMD20E18A device at 0xA.</li> </ul> </li> </ul>

<b>Clock System</b>	<ul style="list-style-type: none"> <li>• Updated the clock names in the <i>Figure 13-1. Clock distribution</i></li> <li>• Updated the description of Generic Clock generators and Generic Clocks in the <i>Clock Distribution</i></li> <li>• Updated the <i>Figure 13-2. Example of SERCOM clock</i> <ul style="list-style-type: none"> <li>— Synchronous Clock Controller renamed to Main clock controller</li> </ul> </li> <li>• Updated the descriptive content of the <i>Read-Synchronization</i> section</li> <li>• Changed the title “Enable Write-Synchronization” to <i>Write-Synchronization of CTRL.ENABLE</i></li> <li>• Updated the content in <i>Clocks after Reset</i> section           <ul style="list-style-type: none"> <li>— Renamed GCLKMAIN to GCLK_MAIN</li> </ul> </li> </ul>
<b>Generic Clock Controller</b>	<ul style="list-style-type: none"> <li>• Updated the <i>Overview</i> section and renamed GCLK_PERIPH to GCLK_PERIPHERAL throughout the datasheet</li> <li>• Updated the <i>Features</i> list</li> <li>• Updated <i>Figure 14-1. Device Clocking Diagram</i> and added a figure note</li> <li>• Updated links in the sections: <i>Power Manageme</i> and in <i>Clocks</i></li> <li>• Updated the content in the <i>Functional Description</i> <ul style="list-style-type: none"> <li>— Added links in the section <i>Initialization</i> for GENDIV, GENCTRL and CLKCTRL</li> <li>— Updated the <i>Figure 14-3. Generic Clock Generator</i></li> <li>— Renamed “External Clock” to <i>Generic Clock Output on I/O Pins</i> and updated the description</li> <li>— Updated the <i>Figure 14-4. Generic Clock Multiplexer</i></li> <li>— Updated the descriptive content in the <i>Disabling a Generic Clock</i> section</li> <li>— Updated the <i>Figure 14-5. GCLK Indirect Access</i>. GCLK becomes Generic Clock</li> <li>— Updated links in the sections: <i>Run in Standby Mode</i> and <i>Synchronization</i></li> </ul> </li> <li>• Added a table note on the Reset of <i>GENCTRL</i> register</li> <li>• Added a third column “Generator Clock Source” in the table <i>GENCTRL Reset Value after a Power Reset</i></li> <li>• Updated the content and replaced the text “if the generator is not used by the RTC” by the “if the generator is not used by the RTC and not a source of a ‘locked’ generic clock” in two tables: <i>GENCTRL Reset Value after a User Reset</i> and <i>GENDIV Reset Value after a User Reset</i></li> </ul>

Power Manager	<ul style="list-style-type: none"> <li>• Updated the content <i>Overview</i> <ul style="list-style-type: none"> <li>— “power save modes” is changed to “sleep modes”</li> <li>— A new line is added: “This is because during STANDBY sleep mode the internal voltage regulator will be in low power mode”</li> </ul> </li> <li>• Updated <i>Featureslist</i> <ul style="list-style-type: none"> <li>— Clock control: “Generates” is changed to “Controls”</li> </ul> </li> <li>• Updated <i>Ie</i> content in the <i>Clockssection</i> <ul style="list-style-type: none"> <li>— “This clock” is changed to “The clock source for GCLK_MAIN”</li> </ul> </li> <li>• Updated the content in <i>Interrupts</i> section <ul style="list-style-type: none"> <li>— Added: “Refer to <i>Nested Vector Interrupt Controller</i>”</li> </ul> </li> <li>• Updated <i>Register Access Protection</i> <ul style="list-style-type: none"> <li>— Added: “Refer to <i>Interrupt Flag Status and Clear - INTFLAG</i> register for details”</li> <li>— Added: “Refer to <i>Reset Cause - RCAUSE</i> register for details”</li> </ul> </li> <li>• Updated the sections: <i>Synchronous Clocks</i> and <i>Sleep Mode Controller</i> <ul style="list-style-type: none"> <li>— Added: “see <i>Table 15-4. Sleep Mode Overview</i>”</li> </ul> </li> <li>• Updated <i>Reset Controller</i> section <ul style="list-style-type: none"> <li>— “resets” corrected to “reset”</li> </ul> </li> <li>• Updated <i>Initialization</i> section <ul style="list-style-type: none"> <li>— Added: “- refer to <i>Reset Cause - RCAUSE</i> register for details”</li> </ul> </li> <li>• Updated <i>Selecting the Synchronous Clock Division Ratio</i> <ul style="list-style-type: none"> <li>— Added: “(APBxSEL.APBxDIV)”</li> </ul> </li> <li>• Updated the figure <i>Synchronous Clock Selection and Prescaler</i></li> <li>• Updated <i>Clock Ready Flag</i> section <ul style="list-style-type: none"> <li>— “CKSEL” is changed to “CPUSEL”</li> </ul> </li> <li>• Updated the <i>Peripheral Clock Masking</i> section <ul style="list-style-type: none"> <li>— Added: “refer to <i>APBA Mask - APBAMASK</i> register for details”</li> <li>— The first sentence below the figure has been changed to: “When the APB clock for a module is not provided its registers cannot be read or written.”</li> </ul> </li> <li>• Updated the content <i>Clock Failure Detector</i> section <ul style="list-style-type: none"> <li>— “CFDEN.CTRL” has been changed to “CTRL.CFDEN”</li> <li>— Added: “Refer to <i>Control - CTRL</i> register for details”</li> <li>— “divided” has been changed to “undivided”</li> <li>— “is generated, if enabled” has been changed to “is set and the corresponding interrupt request will be generated if enabled”</li> <li>— “GCLKMAIN” has been changed to “GCLK_MAIN”</li> <li>— Added: Note 3</li> </ul> </li> <li>• Updated the table <i>Effects of the Different Reset Events</i> <ul style="list-style-type: none"> <li>— “GCLK” has been changed to “Generic Clock”</li> </ul> </li> <li>• Updated the figure <i>Reset Controller</i></li> <li>• Updated the table <i>Sleep Mode Entry and Exit</i> <ul style="list-style-type: none"> <li>— Two notes (“Synchronous” and “Asynchronous”) are added below the table</li> </ul> </li> <li>• Updated the <i>Sleep Mode Controller</i> section <ul style="list-style-type: none"> <li>— Updated the text in STANDBY mode</li> </ul> </li> </ul>

Power Manager (cont.)	<ul style="list-style-type: none"> <li>• Updated the table <i>Sleep Mode Overview</i> <ul style="list-style-type: none"> <li>— Replaced the table with an accurate one</li> </ul> </li> <li>• Updated <i>IDLE Mode</i> section           <ul style="list-style-type: none"> <li>— Second bullet: “any non-masked interrupt” changed to “the occurrence of any interrupt that is not masked in the NVIC Controller”</li> </ul> </li> <li>• Updated <i>STANDBY Mode</i> section           <ul style="list-style-type: none"> <li>— “GCLK” is changed to “Generic Clock”</li> </ul> </li> <li>• Added: <i>SleepWalking</i> section</li> <li>• Updated <i>Bit 4 – BKUPCLK: Backup Clock Select</i> <ul style="list-style-type: none"> <li>— “GCLKMAIN” is changed to “GCLK_MAIN”</li> </ul> </li> </ul>
--------------------------	---

SYSCTRL – System Controller	<ul style="list-style-type: none"> <li>• Updated the content in <i>Overview</i> section <ul style="list-style-type: none"> <li>— “XOSC, XOSC32K, OSC32K, OSCULP32K, OSC8M, DFLL48M, BOD33, BOD12, VREG and VREF” is changed to “clock sources, brown out detectors, on-chip voltage regulator and voltage reference of the device.”</li> <li>— Added: “refer to <i>Power and Clocks Status - PCLKSR</i> register”</li> <li>— Added: “(INTENSET)”</li> <li>— Added: “(INTENCLR)”</li> <li>— Added: “(INTFLAG)”</li> </ul> </li> <li>• Updated the content in <i>Principle of Operation</i> section <ul style="list-style-type: none"> <li>— Added two tables for the behavior of Oscillators and Sleep modes</li> </ul> </li> <li>• Updated <i>Register Access Protection</i> <ul style="list-style-type: none"> <li>— Added: “- refer to <i>INFLAG</i>”</li> </ul> </li> <li>• Updated <i>Analog Connections</i> section <ul style="list-style-type: none"> <li>— Changed “load. Refer” to “load, refer”</li> </ul> </li> <li>• Updated <i>External Multipurpose Crystal Oscillator (XOSC) Operation</i> section <ul style="list-style-type: none"> <li>— Changed “the only” to “only the”</li> <li>— “the XTAL Enable bit (XOSC.XTALEN) must written to one” is changed to “a one must be written to the XTAL Enable bit (XOSC.XTALEN).”</li> </ul> </li> <li>• Updated the content in <i>32kHz External Crystal Oscillator (XOSC32K) Operation</i> section <ul style="list-style-type: none"> <li>— “power-on, reset” is changed to “power-on reset (POR)”</li> <li>— Added: “XOSC32K can provide two clock outputs when connected to a crystal.”</li> </ul> </li> <li>• Updated the content in <i>8MHz Internal Oscillator (OSC8M) Operation</i> section</li> <li>• Updated the content in <i>32kHz Internal Oscillator (OSC32K) Operation</i> section <ul style="list-style-type: none"> <li>— Changed “CALIB” to “OSC32K.CALIB”</li> <li>— Changed “non-volatile memory” to “NVM Software Calibration ROW”</li> <li>— Added: “(refer to <i>NVM Software Calibration Area Mapping</i>)”</li> </ul> </li> <li>• Updated the content in <i>32kHz Ultra Low Power Internal Oscillator (OSCULP32K) Operation</i> section <ul style="list-style-type: none"> <li>— Added: <i>32kHz Ultra Low Power Internal Oscillator (OSCULP32K) Control - OSCULP32K</i> register</li> </ul> </li> <li>• Updated the content in <i>Closed-Loop Operation</i> section <ul style="list-style-type: none"> <li>— List #3: Changed “device” to “DFLL”</li> <li>— Below “Drift Compensation”: “set” has been replaced by “triggered”</li> <li>— The text “shown in the <i>SYSCTRL Block Diagram</i>” has been removed</li> </ul> </li> </ul>
-----------------------------	--

SYSCTRL - System Control (cont.)	<ul style="list-style-type: none"> <li>• Updated <i>Additional Features</i> <ul style="list-style-type: none"> <li>— The text “when disabling the DFLL48M” below “Wake from Sleep Modes” has been replaced by the text “when the DFLL is turned off”</li> </ul> </li> <li>• Updated 3.3V Brown-Out Detector (<i>BOD33</i>) section           <ul style="list-style-type: none"> <li>— “Brown-Out Detector” is replaced by “BOD33”</li> </ul> </li> <li>• Updated 32kHz Internal Oscillator (<i>OSC32K</i>) Control - <i>OSC32K</i> register           <ul style="list-style-type: none"> <li>— The reference for Bits 22:16 - CALIB[6:0] has been corrected</li> </ul> </li> <li>• Updated the table <i>Start-Up Time for External Multipurpose Crystal Oscillator</i> <ul style="list-style-type: none"> <li>— Both notes for this table has been updated/changed</li> <li>— New “Note 3” is added</li> </ul> </li> <li>• Updated the table <i>Start-Up Time for 32kHz External Crystal Oscillator</i> <ul style="list-style-type: none"> <li>— Both notes for this table has been updated/changed</li> <li>— New “Note 3” is added</li> </ul> </li> <li>• Updated the table <i>Start-Up Time for 32kHz Internal Oscillator</i> <ul style="list-style-type: none"> <li>— New column for “Number of OSC32K Clock Cycles” is added</li> <li>— The values in the column for the “old” “Number of OSC32K Clock Cycles” has been corrected</li> <li>— Both notes for this table has been updated/changed</li> <li>— New “Note 3” is added</li> </ul> </li> <li>• Updated <i>DFLL48M Control - DFLLCTRL</i> register           <ul style="list-style-type: none"> <li>— For “Property” the following has been added: “, Write-Synchronized”</li> <li>— Removed RUNSTDBY</li> </ul> </li> <li>• Updated <i>DFLL48M Value - DFLLVAL</i> register           <ul style="list-style-type: none"> <li>— For “Property” the following has been added: “, Read-Synchronized”</li> </ul> </li> <li>• Updated <i>Register Access Protection</i> register           <ul style="list-style-type: none"> <li>— In the bullet point the following is added: “ refer to <i>Interrupt Flag Status and Clear - INTFLAG</i> register”</li> </ul> </li> <li>• Updated <i>Principle of Operation</i> section           <ul style="list-style-type: none"> <li>— Added: “- refer to <i>Control - CTRL</i> register ”and “- refer to <i>Interrupt Enable Clear - INTENCLR</i> register”</li> </ul> </li> <li>• Updated the Default Reset value in <i>8MHz Internal Oscillator (OSC8M) Control - OSC8M</i> register and fixed the RANGE bitfield</li> <li>• Updated the description of the Bit 4 DFLL Ready in <i>Power and Clocks Status - PCLKSR</i> register and updated Bit 11 BOD33 Synchronization Ready</li> </ul>
WDT – Watchdog Timer	<ul style="list-style-type: none"> <li>• Updated <i>Initialization</i> <ul style="list-style-type: none"> <li>— Added: “- refer to <i>CTRL</i> register”, “- refer to <i>CONFIG</i> register”, and “- refer to <i>EWCTRL</i> register”</li> </ul> </li> <li>• Updated <i>Normal Mode</i> <ul style="list-style-type: none"> <li>— Added: “- refer to <i>Clear - CLEAR</i> register</li> </ul> </li> <li>• Updated the description of the Bit 2 (<i>CTRL.WEN</i>) in the <i>Control - CTRL</i> register</li> <li>• Removed “Asynchronous Watchdog Clock Characterization”</li> </ul>

SERCOM SPI – SERCOM Serial Peripheral Interface	<ul style="list-style-type: none"> <li>Updated the description of the <i>SPI Transfer Modes</i> section</li> </ul>
RTC - Real-Time Counter	<ul style="list-style-type: none"> <li>Updated <i>Register Access Protection</i> section <ul style="list-style-type: none"> <li>Added: “- refer to <i>INTFLAG</i> register”, “- refer to <i>READREQ</i> register”, “- refer to <i>STATUS</i> register”, and “- refer to <i>DBGCTRL</i> register”</li> </ul> </li> <li>Updated the content in <i>Initialization</i> section <ul style="list-style-type: none"> <li>Added: “- refer to <i>Event Control - EVCTRL</i> register”</li> </ul> </li> </ul>
EIC - External Interrupt Controller	<ul style="list-style-type: none"> <li>Updated the content in <i>Events</i> section <ul style="list-style-type: none"> <li>Added text “External Interrupt Controller generates events as pulses”</li> </ul> </li> <li>Updated the content <i>Sleep Mode Operation</i> section <ul style="list-style-type: none"> <li>Added text “Using <i>WAKEUPEN[x]=1</i> with <i>INTENSET=0</i> is not recommended”</li> </ul> </li> <li>Updated the content <i>Register Access Protection</i> <ul style="list-style-type: none"> <li>Added: “- refer to <i>INTFLAG</i> register” and “- refer to <i>NMIFLAG</i> register”</li> </ul> </li> <li>Updated <i>Additional Features</i> <ul style="list-style-type: none"> <li>Added: “- refer to <i>NMICTRL</i> register”</li> </ul> </li> </ul>
NVMCTRL - Non-Volatile Memory Controller	<ul style="list-style-type: none"> <li>Updated <i>Power Management</i> section <ul style="list-style-type: none"> <li>Added: “- refer to <i>CTRLB</i> register”</li> </ul> </li> <li>Added <i>Basic Operations</i> section</li> <li>Updated <i>Interrupts</i> section <ul style="list-style-type: none"> <li>Added a reference link to <i>Nested Vector Interrupt Controller</i></li> </ul> </li> <li>Updated the description of <i>NVM Read</i> section</li> <li>Updated the content in <i>Register Access Protection</i> section</li> <li>Added: “- refer to <i>INTFLAG</i> register” and “- refer to <i>STATUS</i> register”</li> <li>Updated the description of <i>MANW</i> bit in <i>CTRLB</i> register</li> <li>Updated the description of <i>ERROR</i> and <i>READY</i> bits in <i>INTENCLR</i> register</li> </ul>
PORT	<ul style="list-style-type: none"> <li>Updated <i>CPU Local Bus</i> section <ul style="list-style-type: none"> <li>Added: “- refer to <i>DIR</i> register”, “- refer to <i>OUT</i> register”, “- refer to <i>IN</i> register”, and “- refer to <i>CTRL</i> register”</li> </ul> </li> <li>Updated <i>Principle of Operation</i> section <ul style="list-style-type: none"> <li>Added: “- refer to <i>DIR</i> register”, “- refer to <i>OUT</i> register”, “- refer to <i>PINCFG0</i> register”, “- refer to <i>IN</i> register”, and “- refer to <i>PMUX0</i> register”</li> </ul> </li> </ul>
TC	<ul style="list-style-type: none"> <li>Updated the table <i>Waveform Generation Operation</i>. Switched “Clear” and “Set” for <i>CCO</i> value (<i>MPWM</i>).</li> </ul>
ADC	<ul style="list-style-type: none"> <li>Updated the content in <i>Sleep Mode Operation</i> section <ul style="list-style-type: none"> <li>Added “While the CPU is sleeping, ADC conversion can only be triggered by events”</li> </ul> </li> <li>Software Calibration Row changed to Software Calibration Area</li> </ul>

AC	<ul style="list-style-type: none"><li>• Updated the content in <i>Sleep Mode Operation</i> section<ul style="list-style-type: none"><li>— Added “While the CPU is sleeping, single-shot comparisons are only triggerable by events”</li></ul></li></ul>
----	---

Electrical Characteristics	<ul style="list-style-type: none"> <li>• Updated <i>Disclaimer</i> section. Removed the preliminary disclaimer</li> <li>• Updated the table <i>Absolute maximum ratings</i> <ul style="list-style-type: none"> <li>— Updated <math>I_{VDD}</math> and <math>I_{GND}</math> max values</li> <li>— Added <math>T_{STORAGE}</math></li> </ul> </li> <li>• Updated the table <i>General operating conditions</i> <ul style="list-style-type: none"> <li>— Added <math>V_{DDIO} - V_{DDANA}</math></li> </ul> </li> <li>• Updated the table <i>Current Consumption</i> <ul style="list-style-type: none"> <li>— Added min and max values</li> <li>— Added consumption data</li> </ul> </li> <li>• Updated <math>I_{OL}</math> and <math>I_{OH}</math> in the table <i>RevD and later normal I/O Pins Characteristics</i></li> <li>• Updated <math>V_{HYS}</math> min value in <i><math>I^2C</math> Pins Characteristics in <math>I^2C</math> configuration</i></li> <li>• Duplicated all tables in the table <i>I/O Pin Characteristics</i> to differentiate rev D (the table <i>RevD and later normal I/O Pins Characteristics</i>) from rev C (the table <i>RevC and later normal I/O Pins Characteristics</i>)</li> <li>• Updated the table and renamed to <i>Voltage Regulator Electrical Characteristics</i> <ul style="list-style-type: none"> <li>— Added condition to <math>V_{DDCORE}</math> characteristics</li> </ul> </li> <li>• Updated the table <i>BOD33 LEVEL Value</i> <ul style="list-style-type: none"> <li>— Added a table note to specify BOD33.LEVEL default production settings</li> </ul> </li> <li>• Updated the table <i>BOD33 Characteristics</i> <ul style="list-style-type: none"> <li>— Added current consumption data (<math>I_{BOD33}</math>)</li> </ul> </li> <li>• ADC Characteristics: Removed the min value of <math>I_{DD}</math> from the table <i>Operating Conditions</i></li> <li>• Updated the Bandgap Gain Error min and max values in the table <i>Differential Mode</i></li> <li>• DAC characteristics: Updated <math>I_{DD}</math> values and conditions in the table <i>Operating Conditions</i></li> <li>• Removed the table note from the table <i>Bandgap (Internal 1.1V reference) characteristics</i></li> <li>• Updated the Accuracy unit in the table <i>Accuracy Characteristics</i></li> <li>• Removed <math>t_{FFP}</math> from the table <i>NVM Characteristics</i></li> <li>• Updated the table <i>Temperature Sensor Characteristics</i></li> <li>• Updated the content in <i>Crystal Oscillator (SOSC) Characteristics</i> section <ul style="list-style-type: none"> <li>— Added new characterization data</li> <li>— Removed <math>f_{CPXIN}</math> min value from <i>Digital Clock Characteristics</i> table</li> </ul> </li> <li>• Changed the title to <i>Digital Frequency Locked Loop (DFLL48M) Characteristics</i> and added table note to <i>DFLL48M Characteristics - Closed Loop Mode</i></li> <li>• Updated the table <i>32kHz Crystal Oscillator Characteristics</i> <ul style="list-style-type: none"> <li>— Updated <math>I_{XOSC32K}</math></li> <li>— Added a table note for “AGC on”: data are not yet available for rev D</li> </ul> </li> <li>• Added current consumption data (<math>I_{OSC32K}</math>) in the table <i>32kHz RC Oscillator Characteristics</i></li> <li>• Updated <math>I_{OSC8M}</math> in the table <i>Internal 8MHz RC Oscillator Characteristics</i></li> </ul>
Package	<ul style="list-style-type: none"> <li>• Added notes to 64QFN, 48QFN and to 32QFN packages</li> <li>• Updated <i>Device and Package Maximum Weight</i> for 32-pin TQFP and for 32-pin QFN <ul style="list-style-type: none"> <li>— Device and Package Maximum Weight is 100mg for TQFP32 and 90mg for QFN32</li> </ul> </li> </ul>

### 37.9. Rev. H 10/2013

Configuration Summary	Added 256KB Flash and 32KB SRAM to the SAM D20E
Ordering Information	Added ATSAMD20E18 ordering code
SYSCTRL	Added note to <i>INFLAG</i> register
NVMCTRL	Updated links to the <i>Flash size for EEPROM emulation</i> table
SERCOM USART	Updated the table <i>Transmit Data Pinout</i> . SERCOM PAD[X] renamed PAD[X]
ADC	<ul style="list-style-type: none"> <li>Updated the <i>Features</i> list. Added "Up to 350,000 samples per second (350ksps)"</li> <li>Updated the broken link for <i>INPUTCTRL</i> register</li> <li>Removed "Additional Features"</li> </ul>
Schematic Checklist	<ul style="list-style-type: none"> <li>Added information about JTAGICE3 compatible SWD connector</li> <li>Updated connector names to match the names used by ARM</li> <li>Added information about general debugging and programming to <i>Programming and Debug Ports</i></li> </ul>
Electrical Characteristics	<ul style="list-style-type: none"> <li>Updated the table <i>General operating conditions</i>. Added table note related to BOD33</li> <li>Updated <i>I/O Pin Characteristics</i>. All V<sub>DDANA</sub> ranges are 1.62V - 2.7V and 2.7V - 3.63V</li> <li>Updated <i>Digital Frequency Locked Loop (DFLL48M) Characteristics</i></li> <li>Updated the table <i>Supply Rise Rates</i> <ul style="list-style-type: none"> <li>Replaced the Maximum value that was based on simulation by the actual measurement value</li> <li>Removed the unused columns</li> </ul> </li> <li>Updated the typical values of while(1) at 1.8V in the table <i>Current Consumption</i></li> <li>Updated the table <i>Decoupling requirements</i> <ul style="list-style-type: none"> <li>Used measurement values</li> <li>Removed the min and max values</li> <li>Added values for C<sub>IN</sub> and C<sub>OUT</sub></li> <li>Added a table note</li> </ul> </li> <li>Updated the table <i>ADC: Operating Conditions</i> <ul style="list-style-type: none"> <li>Added min and max values for I<sub>DD</sub></li> <li>Updated typical values</li> </ul> </li> <li>Updated the table <i>Single-Ended Mode</i> <ul style="list-style-type: none"> <li>Added min and max values</li> <li>Added characteristics for ENOB, SFDR, SINAD and THD</li> </ul> </li> </ul>

Electrical Characteristics	<ul style="list-style-type: none"> <li>Replaced V<sub>DD</sub> by V<sub>DDANA</sub> in the table <i>Clock and Timing</i></li> <li>Updated the table <i>Electrical and Timing</i> <ul style="list-style-type: none"> <li>Added min and max values</li> <li>Added characterization data for V<sub>SCALE</sub></li> </ul> </li> <li>Updated the tables: <i>Differential Mode, Accuracy Characteristics and Temperature Sensor Characteristics</i> <ul style="list-style-type: none"> <li>Added min and max values</li> </ul> </li> <li>Updated the table <i>Flash Endurance and Data Retention</i> and <i>EEPROM Emulation Endurance and Data Retention</i>. Added table note related to the cycling endurance</li> <li>Added output frequency characteristics data to the tables: <i>32kHz RC Oscillator Characteristics, Ultra Low Power Internal 32kHz RC Oscillator Characteristics</i> and <i>Internal 8MHz RC Oscillator Characteristics</i></li> <li>Updated all tables in <i>I/O Pin Characteristics</i> section. Added new characterization data</li> <li>Added V<sub>DDCORE</sub> characteristics to the <i>Voltage Regulator Electrical Characteristics</i></li> <li>Updated the tables: <i>POR Characteristics, Bandgap (Internal 1.1V reference) characteristics, BOD33 LEVEL Value</i> and <i>BOD33 Characteristics</i>. Added new characterization data</li> <li>Updated all tables in <i>Oscillators Characteristics</i> section. Added new characterization data</li> </ul>
ERRATA	Added Errata Revision C

### 37.10. Rev. G 10/2013

Features	Added the Power Consumption
GCLK	<p>Updated <i>Division Factor</i></p> <ul style="list-style-type: none"> <li>Generic clock generator 0 has 8 division factor bits - DIV[7:0]</li> </ul>
NVMCTRL	Updated the table <i>Flash size for EEPROM emulation</i>
Electrical characteristics	<ul style="list-style-type: none"> <li>Updated the table <i>Current Consumption</i>. Added values of CPU running a “While(1)” algorithm</li> <li>Moved the PTC typical figures from the Typical characteristics into the <i>Electrical Characteristics</i></li> <li>Updated the <i>Analog Characteristics</i> Cout max value in the <i>Decoupling requirements</i> table is 1000nF instead of 200nF</li> <li>Updated the <i>NVM Characteristics</i>: <ul style="list-style-type: none"> <li>Added note about the max number of consecutive write in a row before an erase becomes mandatory</li> <li>Removed all “based on simulation” notes</li> <li>Updated the tables: <i>Maximum Operating Frequency, Flash Endurance and Data Retention</i> and <i>EEPROM Emulation Endurance and Data Retention</i></li> </ul> </li> </ul>

### 37.11. Rev. F 10/2013

I/O Multiplexing and Considerations	Updated the table <i>PORT Function Multiplexing</i> <ul style="list-style-type: none"> <li>PA16 and PA17 are I<sup>2</sup>C pins in SERCOM1</li> </ul>
Memories	Updated the table <i>NVM Software Calibration Area Mapping</i> <ul style="list-style-type: none"> <li>Bit Positions [14:3] and [26:15] are “Reserved”</li> </ul>
ADC	Updated the <i>Calibration</i> according to the update done in the <i>NVM Software Calibration Area Mapping</i>
Typical Characteristics	Added the PTC in the Typical Characteristics
ERRATA	Added PTC in Errata <i>Revision B</i>

### 37.12. Rev. E 09/2013

Ordering Information	Updated the figure of the <i>Ordering Information</i> <ul style="list-style-type: none"> <li>Removed “H = -40 - 85C NiPdAu Plating” from the Package Grade</li> <li>Renamed “Product Variant” to “Device variant” in the figure of the <i>Ordering Information</i></li> </ul>
DSU	Updated the <i>DID</i> register <ul style="list-style-type: none"> <li>Renamed SUBFAMILY [7:0] bits to SERIES [7:0] bits</li> <li>The whole description of the DID bit registers updated</li> <li>Added Device (all products in the SAM D20 family) column in Device Selection table (DEVSEL)</li> </ul>
SYSCTRL	Added ENABLE bits for the BODs and oscillators
Electrical characteristics	Updated <i>Supply Characteristics</i> <ul style="list-style-type: none"> <li>Updated the table <i>Supply Rise Rates</i></li> </ul> Updated the <i>I/O Pin Characteristics</i> <ul style="list-style-type: none"> <li>Fixed typos in the tables <i>RevD and later normal I/O Pins Characteristics</i>, <i>SAMD20 revC/revB Normal I/O Pins Characteristics</i> and <i>I<sup>2</sup>C Pins Characteristics in I<sup>2</sup>C configuration</i>: “Vdd” was missing in some cells of the tables.</li> </ul>

### 37.13. Rev. D 08/2013

Description	The content updated
General	Fixed different typos throughout the datasheet and applied correctly the template
Block Diagram	<ul style="list-style-type: none"> <li>Added 2KB RAM and 16KB FLASH</li> </ul>
DSU	Updated the <i>Block Diagram</i> <ul style="list-style-type: none"> <li>Removed HRAM from the block diagram</li> </ul>
Clock System	<ul style="list-style-type: none"> <li>The description of the Basic Read Request has been updated</li> <li>Updated the figure <i>Synchronization</i></li> </ul>

SYSCTRL	<ul style="list-style-type: none"> <li>Updated the writing of the interrupt sources in the <i>Interrupts</i> section</li> <li>Added the reference to <i>INFLAG</i> register</li> </ul>
NVMCTRL	<p>Updated the figure <i>Row Organization</i></p> <ul style="list-style-type: none"> <li>Removed the blue mark from the figure</li> </ul>
PORT	<ul style="list-style-type: none"> <li>IOBUS address 0x60000000 added in <i>CPU Local Bus</i> section</li> <li>Removed RWM from the description</li> </ul>
EVSYS	<p>Updated the <i>CHANNEL</i> register:</p> <ul style="list-style-type: none"> <li>Bits 25:24: CHANNEL:PATH description updated.</li> </ul>
Schematic Checklist	<ul style="list-style-type: none"> <li>Updated the <i>Introduction</i> content</li> <li>Replaced all TDB by their respective values</li> <li>Corrected the typo: the Ohm symbol in <i>External Reset Circuit</i></li> </ul>
Electrical Characteristics	<ul style="list-style-type: none"> <li>Removed the colors from <i>Electrical Characteristics</i></li> <li>Added footnote in the table <i>Operating Conditions</i>, <math>f_{ADC} = 6 * CLK_{ADC}</math></li> </ul>
Table Of Contents	<ul style="list-style-type: none"> <li>Applied correctly the template for the TOC</li> </ul>

### 37.14. Rev. C – 07/2013

Description	<p>Updated the front page:</p> <ul style="list-style-type: none"> <li>Removed the “Embedded Flash” from the title and from the description on the page 1</li> <li>Replaced “speeds” by “frequencies” on the page 1</li> <li>Added a sub-bullet on PTC in feature list (256-Channel capacitive touch and proximity sensing) on the page 2</li> <li>Replaced IO lines by IO pins on the page 2</li> </ul>
Configuration Summary	<p>Updated the table</p> <ul style="list-style-type: none"> <li>The RTC</li> <li>I/O lines changed to I/O pins</li> <li>Changed 32.768kHz high-accuracy oscillator to 32.768kHz oscillator</li> <li>Changed 32.768kHz ultra-low power internal oscillator to 32kHz ULP oscillator</li> <li>Changed 8MHz internal oscillator to 8MHz high-accuracy internal oscillator</li> <li>Updated SW Debug Interface</li> <li>Updated the WDT</li> </ul>
Ordering information	<ul style="list-style-type: none"> <li>Replaced “base line” by “general purpose”</li> <li>Centered the tables except the ordering code table.</li> </ul>
About the Document	<ul style="list-style-type: none"> <li>Renamed the chapter to Appendix A and Appendix B</li> <li>Moved the two Appendixes at the end of the datasheet</li> <li>Changed the tag of the tables to the tag of appendix tables</li> </ul>

Pinout	<ul style="list-style-type: none"> <li>Updated the description of “Multiplexing Signals”</li> <li>Replaced “PORT controller” by “PORT”</li> <li>Set the table <i>PORT Function Multiplexing</i> as a continuing table and updated the table notes</li> <li>Replaced I/O lines by I/O pins</li> </ul>
Signal Description	<ul style="list-style-type: none"> <li>Removed the column “Comment” from the table</li> </ul>
Power Supply	<ul style="list-style-type: none"> <li>Removed “nominal” from power supplies</li> <li>Updated the description of vector regulator</li> <li>Added link to the “Schematic Checklist”</li> </ul>
Clock System	Added the link in the description of <i>Write-Synchronization</i>
Power Manager	<p>Updated the table <i>Sleep Mode Overview</i>:</p> <ul style="list-style-type: none"> <li>The column “Clock Sources” has been updated with new commands</li> <li>The table note 2 replaced by a reference to <i>On-demand, Clock Requests</i></li> </ul>
ADC	<p>Updated the content in <i>Interrupt Flag Status and Clear - INFLAG register</i>:</p> <ul style="list-style-type: none"> <li>Bit 2: INTFLAG.WINMON description updated</li> <li>Bit 1: INTFLAG.OVERRUN description updated</li> <li>Bit 0: INTFLAG.RESRDY description updated</li> </ul>
DAC	<ul style="list-style-type: none"> <li><i>Register Summary</i>: DATA and DATABUF register bit fields updated.</li> <li><i>DATA register</i>: Bit fields and description updated.</li> <li><i>DATABUF register</i>: Bit fields and description updated.</li> </ul>
Electrical Characteristics Electrical Chara	Added <i>Electrical Characteristics</i> at 85°C
Package Information	Corrected the 64 pins QFN drawing

### 37.15. Rev. B – 07/2013

Block Diagram	Added output from Analog Comparator block
Signal Description	Updated the content in <i>Signal Description</i> table
Memories	Added OSC32K Calibration (bit position 44:38) in the table <i>NVM Software Calibration Area Mapping</i>
DSU	<p>Updated the content in <i>Die Identification - DID register</i>:</p> <ul style="list-style-type: none"> <li>Bit 15:12: Added DIE[3:0] bit group</li> <li>Bit 11:8: Added REVISION[3:0] bit group</li> </ul>
EVSYS	Updated <i>Features</i> : Number of event generators updated from 59 to 58

SERCOM SPI	<p>Updated <i>Control A - CTRLA</i> register:</p> <ul style="list-style-type: none"> <li>Bit 16: CTRLA.DOPO updated to Bit17:16: CTRLA.DOPO[1:0]</li> <li>Bit 17:16 - DOPO[1:0] description updated</li> </ul> <p>Updated <i>Status - STATUSregister</i>:</p> <ul style="list-style-type: none"> <li>Bit 2 - STATUS.BUFOVF description updated</li> </ul>
ADC	<p>Added <i>Accumulation</i> section</p> <p>Updated <i>Averaging</i> section</p> <p>Updated <i>Oversampling and Decimation</i> section</p>
AC	<p>Heading updated from Basic Operation to <i>Starting a Comparison</i>.</p> <p>Updated the list of write-synchronized bits and registers in <i>Synchronization</i> section</p> <p>Register property updated to “Write-Synchronized” in registers:</p> <ul style="list-style-type: none"> <li><i>Control A - CTRLA</i> and <i>Comparator Control n - COMPCTRLn</i></li> </ul>
SYSCTRL	<ul style="list-style-type: none"> <li>Removed VDDMON and ENABLE bits from registers.</li> <li>Updated start-up time tables for XOSC32K and OSC32K: <ul style="list-style-type: none"> <li>XOSC register: Table <i>Start-Up Time for External Multipurpose Crystal Oscillator</i></li> <li>XOSC32K register: Table <i>Start-Up Time for 32kHz External Crystal Oscillator</i></li> <li>OSC32K register: Table <i>Start-Up Time for 32kHz Internal Oscillator</i></li> </ul> </li> </ul>
Errata Rev. B	<p>Errata <i>Revision B</i> updates:</p> <ul style="list-style-type: none"> <li><i>Device</i>: Two errata added (10988 and 10537)</li> <li><i>PM</i>: Two errata added (10858 and 11012)</li> <li><i>XOSC32K</i>: One errata added (10933)</li> <li><i>DFLL48M</i>: Two errata added (10634, 10537), one errata updated (10669)</li> <li><i>EVSYS</i>: One errata added (10895)</li> <li><i>SERCOM</i>: Two errata added (10812 and 10563), one errata removed (10563)</li> <li><i>ADC</i>: One errata updated (10530)</li> <li><i>Flash</i>: One errata updated (10804)</li> </ul>
Errata Rev. A	Status changed to “Not Sampled”

### 37.16. Rev. A 06/2013

1.	Initial revision
----	------------------

## 38. Conventions

### 38.1. Numerical Notation

Table 38-1. Numerical Notation

Symbol	Description
165	Decimal number
0b0101	Binary number (example 0b0101 = 5 decimal)
'0101'	Binary numbers are given without prefix if unambiguous.
0x3B24	Hexadecimal number
X	Represents an unknown or don't care value
Z	Represents a high-impedance (floating) state for either a signal or a bus

### 38.2. Memory Size and Type

Table 38-2. Memory Size and Bit Rate

Symbol	Description
KB (kbyte)	kilobyte ( $2^{10} = 1024$ )
MB (Mbyte)	megabyte ( $2^{20} = 1024 \times 1024$ )
GB (Gbyte)	gigabyte ( $2^{30} = 1024 \times 1024 \times 1024$ )
b	bit (binary '0' or '1')
B	byte (8 bits)
1kbit/s	1,000 bit/s rate (not 1,024 bit/s)
1Mbit/s	1,000,000 bit/s rate
1Gbit/s	1,000,000,000 bit/s rate
word	32 bit
half-word	16 bit

### 38.3. Frequency and Time

Symbol	Description
kHz	$1\text{kHz} = 10^3\text{Hz} = 1,000\text{Hz}$
KHz	$1\text{KHz} = 1,024\text{Hz}$ , $32\text{KHz} = 32,768\text{Hz}$
MHz	$10^6 = 1,000,000\text{Hz}$

Symbol	Description
GHz	$10^9 = 1,000,000,000\text{Hz}$
s	second
ms	millisecond
$\mu\text{s}$	microsecond
ns	nanosecond

## 38.4. Registers and Bits

Table 38-3. Register and Bit Mnemonics

Symbol	Description
R/W	Read/Write accessible register bit. The user can read from and write to this bit.
R	Read-only accessible register bit. The user can only read this bit. Writes will be ignored.
W	Write-only accessible register bit. The user can only write this bit. Reading this bit will return an undefined value.
BIT	Bit names are shown in uppercase. (Example ENABLE)
FIELD[n:m]	A set of bits from bit n down to m. (Example: PINA[3:0] = {PINA3, PINA2, PINA1, PINA0})
Reserved	Reserved bits are unused and reserved for future use. For compatibility with future devices, always write reserved bits to zero when the register is written. Reserved bits will always return zero when read.
PERIPHERAL <i>i</i>	If several instances of a peripheral exist, the peripheral name is followed by a number to indicate the number of the instance in the range 0-n. PERIPHERAL0 denotes one specific instance.
Reset	Value of a register after a power reset. This is also the value of registers in a peripheral after performing a software reset of the peripheral, except for the Debug Control registers.
SET/CLR	Registers with SET/CLR suffix allows the user to clear and set bits in a register without doing a read-modify-write operation. These registers always come in pairs. Writing a one to a bit in the CLR register will clear the corresponding bit in both registers, while writing a one to a bit in the SET register will set the corresponding bit in both registers. Both registers will return the same value when read. If both registers are written simultaneously, the write to the CLR register will take precedence.

## 39. Acronyms and Abbreviations

The below table contains acronyms and abbreviations used in this document.

**Table 39-1. Acronyms and Abbreviations**

Abbreviation	Description
AC	Analog Comparator
ADC	Analog-to-Digital Converter
ADDR	Address
AES	Advanced Encryption Standard
AHB	AMBA Advanced High-performance Bus
AMBA®	Advanced Microcontroller Bus Architecture
APB	AMBA Advanced Peripheral Bus
AREF	Analog reference voltage
BLB	Boot Lock Bit
BOD	Brown-out detector
CAL	Calibration
CC	Compare/Capture
CCL	Configurable Custom Logic
CLK	Clock
CRC	Cyclic Redundancy Check
CTRL	Control
DAC	Digital-to-Analog Converter
DAP	Debug Access Port
DFLL	Digital Frequency Locked Loop
DMAC	DMA (Direct Memory Access) Controller
DSU	Device Service Unit
EEPROM	Electrically Erasable Programmable Read-Only Memory
EIC	External Interrupt Controller
EVSYS	Event System
GCLK	Generic Clock Controller
GND	Ground
GPIO	General Purpose Input/Output
I²C	Inter-Integrated Circuit
IF	Interrupt flag

<b>Abbreviation</b>	<b>Description</b>
INT	Interrupt
MBIST	Memory built-in self-test
MEM-AP	Memory Access Port
MTB	Micro Trace Buffer
NMI	Non-maskable interrupt
NVIC	Nested Vector Interrupt Controller
NVM	Non-Volatile Memory
NVMCTRL	Non-Volatile Memory Controller
OSC	Oscillator
PAC	Peripheral Access Controller
PC	Program Counter
PER	Period
PM	Power Manager
POR	Power-on reset
PORT	I/O Pin Controller
PTC	Peripheral Touch Controller
PWM	Pulse Width Modulation
RAM	Random-Access Memory
REF	Reference
RTC	Real-Time Counter
RX	Receiver/Receive
SERCOM	Serial Communication Interface
SMBus™	System Management Bus
SP	Stack Pointer
SPI	Serial Peripheral Interface
SRAM	Static Random-Access Memory
SUPC	Supply Controller
SWD	Serial Wire Debug
TC	Timer/Counter
TCC	Timer/Counter for Control Applications
TRNG	True Random Number Generator
TX	Transmitter/Transmit
ULP	Ultra-low power

<b>Abbreviation</b>	<b>Description</b>
USART	Universal Synchronous and Asynchronous Serial Receiver and Transmitter
USB	Universal Serial Bus
V <sub>DD</sub>	Common voltage to be applied to VDDIO and VDDANA
V <sub>DDIO</sub>	Digital supply voltage
V <sub>DDANA</sub>	Analog supply voltage
VREF	Voltage reference
WDT	Watchdog Timer
XOSC	Crystal Oscillator

## 40. Appendix A: Electrical Characteristics at 105°C

### 40.1. Disclaimer

All typical values are measured at  $T = 25^\circ\text{C}$  unless otherwise specified. All minimum and maximum values are valid across operating temperature and voltage unless otherwise specified.

These electrical characteristics are relevant for SAMD20 revD and later.

### 40.2. Absolute Maximum Ratings

Stresses beyond those listed in the following table may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 40-1. Absolute Maximum Ratings

Symbol	Parameter	Min.	Max.	Units
$V_{DD}$	Power supply voltage	0	3.8	V
$I_{VDD}$	Current into a $V_{DD}$ pin	-	48 <sup>(1)</sup>	mA
$I_{GND}$	Current out of a GND pin	-	68 <sup>(1)</sup>	mA
$V_{PIN}$	Pin voltage with respect to GND and $V_{DD}$	GND-0.6V	$V_{DD}+0.6V$	V
$T_{storage}$	Storage temperature	-60	150	°C

Note: 1. Maximum source current is 24mA and maximum sink current is 34mA per cluster. A cluster is a group of GPIOs as shown in *GPIO Clusters* table. Also note that each  $V_{DD}/GND$  pair is connected to 2 clusters so current consumption through the pair will be a sum of the clusters source/sink currents.

See *GPIO Clusters* table through the related link below.

#### Related Links

[Absolute Maximum Ratings](#) on page 606

### 40.3. General Operating Ratings

The device must operate within the ratings listed in the following table in order for all other electrical characteristics and typical characteristics of the device to be valid.

Table 40-2. General operating conditions

Symbol	Parameter	Min.	Typ.	Max.	Units
$V_{DD}$	Power supply voltage	1.62 <sup>(1)</sup>	3.3	3.63	V
$V_{DDANA}$	Analog supply voltage	1.62 <sup>(1)</sup>	3.3	3.63	V
$T_A$	Temperature range	-40	25	105	°C
$T_J$	Junction temperature	-	-	145	°C

Notes: 1. With BOD33 disabled. If the BOD33 is enabled, check *BOD33 LEVEL Value*Table 40-9

Note: 2. In debugger cold-plugging mode, NVM erase operations are not protected by the BOD33 and BOD12. NVM erase operation at supply voltages below specified minimum can cause corruption of NVM areas that are mandatory for correct device behavior.

## 40.4. Maximum Clock Frequencies

Table 40-3. Maximum GCLK Generator Output Frequencies

Symbol	Description	Conditions	Max.	Units
$f_{GCLKGEN0} / f_{GCLK\_MAIN}$	GCLK Generator Output Frequency	Undivided	48	
$f_{GCLKGEN1}$				
$f_{GCLKGEN2}$		Divided	32	MHz
$f_{GCLKGEN3}$				
$f_{GCLKGEN4}$				
$f_{GCLKGEN5}$				
$f_{GCLKGEN6}$				
$f_{GCLKGEN7}$				

Table 40-4. Maximum Peripheral Clock Frequencies

Symbol	Description	Max.	Units
$f_{CPU}$	CPU clock frequency	32	MHz
$f_{AHB}$	AHB clock frequency	32	MHz
$f_{APBA}$	APBA clock frequency	32	MHz
$f_{APBB}$	APBB clock frequency	32	MHz
$f_{APBC}$	APBC clock frequency	32	MHz
$f_{GCLK\_DFLL48M\_REF}$	DFLL48M Reference clock frequency	35.1	kHz
$f_{GCLK\_WDT}$	WDT input clock frequency	48	MHz
$f_{GCLK\_RTC}$	RTC input clock frequency	48	MHz
$f_{GCLK\_EIC}$	EIC input clock frequency	48	MHz
$f_{GCLK\_EVSYS\_CHANNEL\_0}$	EVSYS channel 0 input clock frequency	48	MHz
$f_{GCLK\_EVSYS\_CHANNEL\_1}$	EVSYS channel 1 input clock frequency	48	MHz
$f_{GCLK\_EVSYS\_CHANNEL\_2}$	EVSYS channel 2 input clock frequency	48	MHz
$f_{GCLK\_EVSYS\_CHANNEL\_3}$	EVSYS channel 3 input clock frequency	48	MHz
$f_{GCLK\_EVSYS\_CHANNEL\_4}$	EVSYS channel 4 input clock frequency	48	MHz
$f_{GCLK\_EVSYS\_CHANNEL\_5}$	EVSYS channel 5 input clock frequency	48	MHz
$f_{GCLK\_EVSYS\_CHANNEL\_6}$	EVSYS channel 6 input clock frequency	48	MHz

Symbol	Description	Max.	Units
$f_{GCLK\_EVSYS\_CHANNEL\_7}$	EVSYS channel 7 input clock frequency	48	MHz
$f_{GCLK\_SERCOMx\_SLOW}$	Common SERCOM slow input clock frequency	48	MHz
$f_{GCLK\_SERCOM0\_CORE}$	SERCOM0 input clock frequency	48	MHz
$f_{GCLK\_SERCOM1\_CORE}$	SERCOM1 input clock frequency	48	MHz
$f_{GCLK\_SERCOM2\_CORE}$	SERCOM2 input clock frequency	48	MHz
$f_{GCLK\_SERCOM3\_CORE}$	SERCOM3 input clock frequency	48	MHz
$f_{GCLK\_SERCOM4\_CORE}$	SERCOM4 input clock frequency	48	MHz
$f_{GCLK\_SERCOM5\_CORE}$	SERCOM5 input clock frequency	48	MHz
$f_{GCLK\_TC0, GCLK\_TC1}$	TC0,TC1 input clock frequency	48	MHz
$f_{GCLK\_TC2, GCLK\_TC3}$	TC2,TC3 input clock frequency	48	MHz
$f_{GCLK\_TC4, GCLK\_TC5}$	TC4,TC5 input clock frequency	48	MHz
$f_{GCLK\_TC6, GCLK\_TC7}$	TC6,TC7 input clock frequency	48	MHz
$f_{GCLK\_ADC}$	ADC input clock frequency	48	MHz
$f_{GCLK\_AC\_DIG}$	AC digital input clock frequency	48	MHz
$f_{GCLK\_AC\_ANA}$	AC analog input clock frequency	64	kHz
$f_{GCLK\_DAC}$	DAC input clock frequency	350	kHz
$f_{GCLK\_PTC}$	PTC input clock frequency	48	MHz

## 40.5. Power Consumption

The values in the *Current Consumption* table are measured values of power consumption under the following conditions, except where noted:

- Operating conditions
  - $V_{VDDIN} = 3.3\text{ V}$
- Wake up time from sleep mode is measured from the edge of the wakeup signal to the execution of the first instruction fetched in flash.
- Oscillators
  - XOSC (crystal oscillator) with an external 32MHz clock on XIN
  - XOSC32K (32 kHz crystal oscillator) stopped
  - DFLL48M stopped
- Clocks
  - XOSC used as main clock source, except otherwise specified
  - CPU, AHB clocks undivided
  - APBA clock divided by 4
  - APBB and APBC bridges off
- The following AHB module clocks are running: NVMCTRL, APBA bridge
  - All other AHB clocks stopped
- The following peripheral clocks running: PM, SYSCTRL, RTC

- All other peripheral clocks stopped
- I/Os are inactive with internal pull-up
- CPU is running on flash with 1 wait states
- Low power cache enabled
- BOD33 disabled

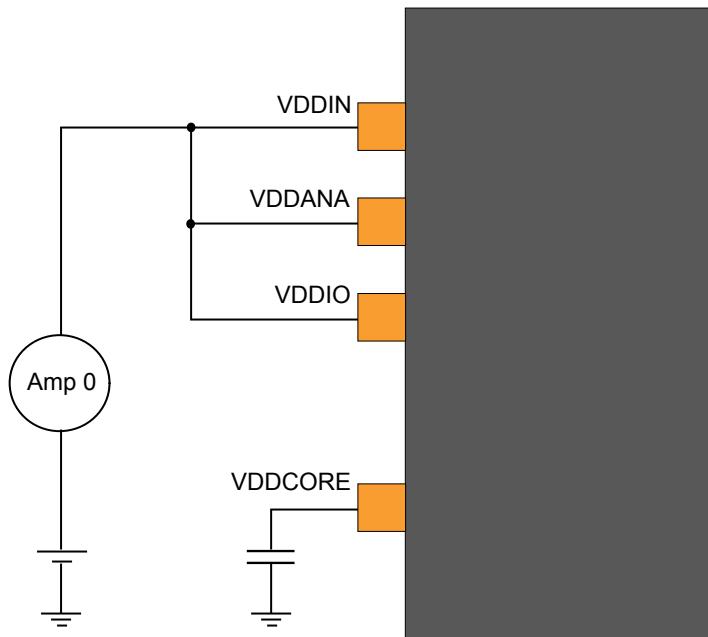

**Table 40-5. Current Consumption**

Mode	Conditions	T <sub>A</sub>	Min.	Typ.	Max.	Units
ACTIVE	CPU running a While(1) algorithm	105°C	-	2.55	2.75	mA
	CPU running a While(1) algorithm V <sub>DDIN</sub> =1.8V, CPU is running on Flash with 3 wait states		-	2.56	2.82	
	CPU running a While(1) algorithm, CPU is running on Flash with 3 wait states with GCLKIN as reference		-	42*freq +318	42*freq +432	µA (with freq in MHz)
	CPU running a Fibonacci algorithm		-	4.21	4.59	mA
	CPU running a Fibonacci algorithm V <sub>DDIN</sub> =1.8V, CPU is running on flash with 3 wait states		-	4.23	4.57	
	CPU running a Fibonacci algorithm, CPU is running on Flash with 3 wait states with GCLKIN as reference		-	80*freq +320	82*freq +432	µA (with freq in MHz)
	CPU running a CoreMark algorithm		-	6.02	6.54	mA
	CPU running a CoreMark algorithm V <sub>DDIN</sub> =1.8V, CPU is running on flash with 3 wait states		-	5.21	5.57	
	CPU running a CoreMark algorithm, CPU is running on Flash with 3 wait states with GCLKIN as reference		-	96*freq +322	98*freq +432	µA (with freq in MHz)
IDLE0		25°C	-	1.55	1.62	mA
IDLE1			-	1.13	1.18	
IDLE2			-	0.96	1.01	
STANDBY	XOSC32K running RTC running at 1kHz <sup>(1)</sup>	25°C	-	71.3	-	µA
	XOSC32K and RTC stopped <sup>(1)</sup>	105°C	-	214	627	
		25°C	-	69.8	-	
		105°C	-	212	624	

Note: 1. Measurements were done with SYSCTRL->VREG.bit.RUNSTDBY = 1

**Table 40-6. Wake-up Time**

Mode	Conditions	T <sub>A</sub>	Min.	Typ.	Max.	Units
IDLE0	OSC8M used as main clock source, low power cache disabled	105°C	3.8	4	4.1	μs
IDLE1			12.8	14.3	15.7	
IDLE2			13.7	15.2	16.6	
STANDBY			18.7	20.1	21.6	

**Figure 40-1. Measurement Schematic**

## 40.6. Injection Current

Stresses beyond those listed in the table below may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Table 40-7. Injection Current<sup>(1)</sup>**

Symbol	Description	min	max	Unit
I <sub>inj1</sub> <sup>(2)</sup>	IO pin injection current	-1	+1	mA
I <sub>inj2</sub> <sup>(3)</sup>	IO pin injection current	-15	+15	mA
I <sub>injtotal</sub>	Sum of IO pins injection current	-45	+45	mA

**Note:**

1. Injecting current may have an effect on the accuracy of Analog blocks
2. Conditions for V<sub>pin</sub>: V<sub>pin</sub> < GND-0.6V or 3.6V < V<sub>pin</sub> ≤ 4.2V.  
Conditions for V<sub>DD</sub>: 3V < V<sub>DD</sub> ≤ 3.6V.

If  $V_{pin}$  is lower than GND-0.6V, then a current limiting resistor is required. The negative DC injection current limiting resistor  $R$  is calculated as  $R = |(GND-0.6V - V_{pin})/I_{inj1}|$ .

If  $V_{pin}$  is greater than  $V_{DD}+0.6V$ , a current limiting resistor is required. The positive DC injection current limiting resistor  $R$  is calculated as  $R = (V_{pin}-(V_{DD}+0.6V))/I_{inj1}$ .

3. Conditions for  $V_{pin}$ :  $V_{pin} < GND-0.6V$  or  $V_{pin} \leq 3.6V$ .

Conditions for  $V_{DD}$ :  $V_{DD} \leq 3V$ .

If  $V_{pin}$  is lower than GND-0.6V, a current limiting resistor is required. The negative DC injection current limiting resistor  $R$  is calculated as  $R = |(GND-0.6V - V_{pin})/I_{inj2}|$ .

If  $V_{pin}$  is greater than  $V_{DD}+0.6V$ , a current limiting resistor is required. The positive DC injection current limiting resistor  $R$  is calculated as  $R = (V_{pin}-(V_{DD}+0.6V))/I_{inj2}$ .

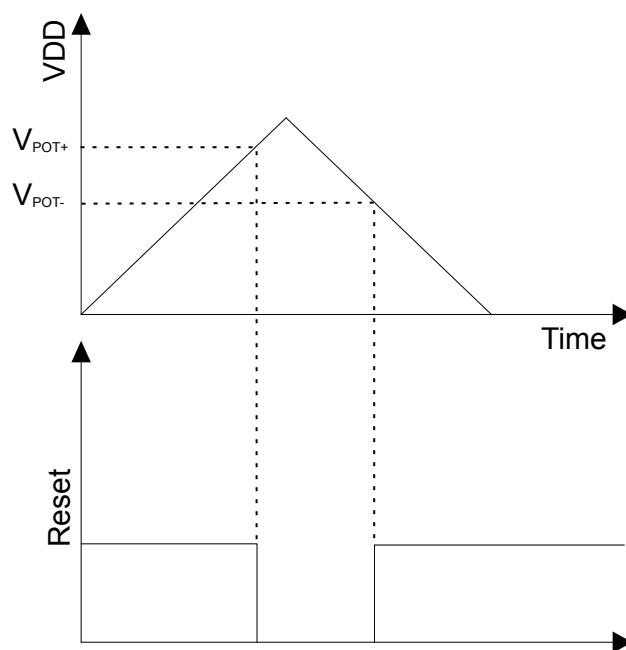

## 40.7. Analog Characteristics

### 40.7.1. Power-On Reset (POR) Characteristics

Table 40-8. POR Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$V_{POT+}$	Voltage threshold on $V_{DD}$ rising	$V_{DD}$ falls at 1V/ms or slower	1.27	1.45	1.60	V
$V_{POT-}$	Voltage threshold on $V_{DD}$ falling		0.72	0.99	1.32	V

Figure 40-2. POR Operating Principle

## 40.7.2. Brown-Out Detectors Characteristics

### 40.7.2.1. BOD33

Table 40-9. BOD33 Characteristics

Symbol	Parameter	Conditions		Min.	Typ.	Max.	Units
	Step size, between adjacent values in BOD33.LEVEL			-	34	-	mV
V <sub>HYST</sub>	Hysteresis			35	-	170	mV
t <sub>DET</sub>	Detection time	Time with V <sub>DDANA</sub> < V <sub>TH</sub> necessary to generate a reset signal		-	0.9 <sup>(1)</sup>	-	μs
t <sub>STARTUP</sub>	Startup time		-40°C to 105°C	-	2.2 <sup>(1)</sup>	-	μs
I <sub>IdleBOD33</sub>	Current consumption in Active/Idle Mode	Continuous mode	25°C	25	48	μA	
			-40°C to 105°C	-	51		
		Sampling mode	25°C	0.034	0.21		
			-40°C to 105°C	-	2.45		
I <sub>SbyBOD33</sub>	Current Consumption in Standby mode	Sampling mode	25°C	0.132	0.38	μA	
			-40°C to 105°C	-	1.5		

Note: 1. These values are based on simulation. These values are not covered by test limits in production or characterization.

## 40.7.3. Analog-to-Digital (ADC) characteristics

Table 40-10. Operating Conditions

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
RES	Resolution		8	-	12	bits
f <sub>CLK_ADC</sub>	ADC Clock frequency		30	-	2100	kHz
	Sample rate <sup>(1)</sup>	Single shot (with V <sub>DDANA</sub> > 2.7V) <sup>(4)</sup>	5	-	300	ksps
		Free running	5	-	350 <sup>(3)</sup>	ksps
	Sampling time <sup>(1)</sup>		0.5	-	-	cycles
	Conversion time <sup>(1)</sup>	1x Gain	-	6	-	cycles
V <sub>REF</sub>	Voltage reference range		1.0	-	V <sub>DDANA</sub> -0.6	V

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$V_{REFINT1V}$	Internal 1V reference <sup>(2)</sup>		-	1.0	-	V
$V_{REFINTVCC0}$	Internal ratiometric reference 0 <sup>(2)</sup>		-	$V_{DDANA}/1.48$	-	V
$V_{REFINTVCC0}$ Voltage Error	Internal ratiometric reference 0 error <sup>(2)</sup>	-40°C to 85°C	-1.0	-	+1.0	%
$V_{REFINTVCC1}$	Internal ratiometric reference 1 <sup>(2)</sup>	$V_{DDANA} > 2.0V$	-	$V_{DDANA}/2$	-	V
$V_{REFINTVCC1}$ Voltage Error	Internal ratiometric reference 1 error <sup>(2)</sup>	$2.0V < V_{DDANA} < 3.63V$ -40°C to 85°C	-1.0	-	+1.0	%
	Conversion range <sup>(1)</sup>	Differential mode	$-V_{REF}/GAIN$	-	$+V_{REF}/GAIN$	V
		Single-ended mode	0.0	-	$+V_{REF}/GAIN$	V
$C_{SAMPLE}$	Sampling capacitance <sup>(2)</sup>		-	3.5	-	pF
$R_{SAMPLE}$	Input channel source resistance <sup>(2)</sup>		-	-	3.5	kΩ
$I_{DD}$	DC supply current <sup>(1)</sup>	$f_{CLK\_ADC} = 2.1MHz^{(3)}$	-	1.25	2.78	mA

- Notes:
1. These values are based on characterization. These values are not covered by test limits in production.
  2. These values are based on simulation. These values are not covered by test limits in production or characterization.
  3. In this condition and for a sample rate of 350ksps, a conversion takes 6 clock cycles of the ADC clock (conditions: 1X gain, 12-bit resolution, differential mode, free-running).
  4. All single-shot measurements are performed with  $V_{DDANA} > 2.7V$  (cf. ADC errata)

Table 40-11. Differential Mode

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
ENOB	Effective Number Of Bits	With gain compensation	-	10.5	10.7	bits
TUE	Total Unadjusted Error	1x Gain	1.5	4.3	17.0	LSB
INL	Integral Non Linearity	1x Gain	1.0	1.3	6.3	LSB
DNL	Differential Non Linearity	1x Gain	+/-0.3	+/-0.5	+/-0.95	LSB
	Gain Error	Ext. Ref 1x	-15.0	2.5	+20.0	mV
		$V_{REF}=V_{DDANA}/1.48$	-20.0	-1.5	+10.0	mV
		$V_{REF}= INT1V$	-15.0	-5.0	+10.0	mV
	Gain Accuracy <sup>(5)</sup>	Ext. Ref. 0.5x	+/-0.1	+/-0.2	+/-0.45	%
		Ext. Ref. 2x to 16x	+/-0.1	+/-0.2	+/-2.0	%

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
	Offset Error	Ext. Ref. 1x	-10.0	-1.5	+10.0	mV
		$V_{REF} = V_{DDANA}/1.48$	-10.0	0.5	+10.0	mV
		$V_{REF} = \text{INT1V}$	-10.0	3.0	+10.0	mV
SFDR	Spurious Free Dynamic Range	1x Gain	64.2	70.0	78.9	dB
SINAD	Signal-to-Noise and Distortion	$F_{CLK\_ADC} = 2.1\text{MHz}$ $F_{IN} = 40\text{kHz}$	61.4	65.0	66.0	dB
SNR	Signal-to-Noise Ratio	$A_{IN} = 95\%\text{FSR}$	64.3	65.5	66.0	dB
THD	Total Harmonic Distortion		-74.8	-64.0	-65.0	dB
	Noise RMS	T=25°C	0.6	1.0	1.6	mV

**Note:** Maximum numbers are based on characterization and not tested in production, and valid for 5% to 95% of the input voltage range.

**Note:** Dynamic parameter numbers are based on characterization and not tested in production.

**Note:** Respect the input common mode voltage through the following equations (where  $V_{CM\_IN}$  is the Input channel common mode voltage):

a. If  $|V_{IN}| > V_{REF}/4$

- $V_{CM\_IN} < 0.95*V_{DDANA} + V_{REF}/4 - 0.75\text{V}$
- $V_{CM\_IN} > V_{REF}/4 - 0.05*V_{DDANA} - 0.1\text{V}$

b. If  $|V_{IN}| < V_{REF}/4$

- $V_{CM\_IN} < 1.2*V_{DDANA} - 0.75\text{V}$
- $V_{CM\_IN} > 0.2*V_{DDANA} - 0.1\text{V}$

**Note:** The ADC channels on pins PA08, PA09, PA10, PA11 are powered from the VDDIO power supply. The ADC performance of these pins will not be the same as all the other ADC channels on pins powered from the VDDANA power supply.

**Note:** The gain accuracy represents the gain error expressed in percent. Gain accuracy (%) = (Gain Error in V x 100) / (2\* $V_{REF}/GAIN$ )

Table 40-12. Single-Ended Mode

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
ENOB	Effective Number of Bits	With gain compensation	-	9.5	9.8	Bits
TUE	Total Unadjusted Error	1x gain	-	10.5	40.0	LSB
INL	Integral Non-Linearity	1x gain	1.0	1.6	7.5	LSB
DNL	Differential Non-Linearity	1x gain	+/-0.5	+/-0.6	+/-0.95	LSB
	Gain Error	Ext. Ref. 1x	-5.0	0.7	+5.0	mV
	Gain Accuracy <sup>(4)</sup>	Ext. Ref. 0.5x	+/-0.1	+/-0.34	+/-0.4	%
		Ext. Ref. 2x to 16X	+/-0.01	+/-0.1	+/-0.15	%
	Offset Error	Ext. Ref. 1x	-5.0	1.5	+10.0	mV

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
SFDR	Spurious Free Dynamic Range	1x Gain $F_{CLK\_ADC} = 2.1\text{MHz}$ $F_{IN} = 40\text{kHz}$	63.1	65.0	66.5	dB
SINAD	Signal-to-Noise and Distortion	$A_{IN} = 95\%\text{FSR}$	50.7	59.5	61.0	dB
SNR	Signal-to-Noise Ratio		49.9	60.0	64.0	dB
THD	Total Harmonic Distortion		-65.4	-63.0	-62.1	dB
	Noise RMS	$T = 25^\circ\text{C}$	-	1.0	-	mV

**Note:** Maximum numbers are based on characterization and not tested in production, and for 5% to 95% of the input voltage range.

**Note:** Respect the input common mode voltage through the following equations (where  $V_{CM\_IN}$  is the Input channel common mode voltage) for all  $V_{IN}$ :

- $V_{CM\_IN} < 0.7*V_{DDANA} + V_{REF}/4 - 0.75\text{V}$
- $V_{CM\_IN} > V_{REF}/4 - 0.3*V_{DDANA} - 0.1\text{V}$

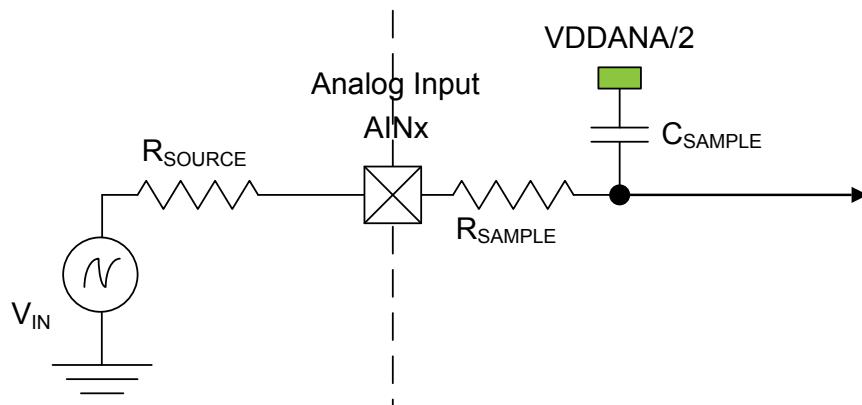

**Note:** The ADC channels on pins PA08, PA09, PA10, PA11 are powered from the VDDIO power supply. The ADC performance of these pins will not be the same as all the other ADC channels on pins powered from the VDDANA power supply.

**Note:** The gain accuracy represents the gain error expressed in percent. Gain accuracy (%) = (Gain Error in V x 100) / ( $V_{REF}/GAIN$ )

#### 40.7.3.1. Inputs and Sample and Hold Acquisition Times

The analog voltage source must be able to charge the sample and hold (S/H) capacitor in the ADC in order to achieve maximum accuracy. Seen externally the ADC input consists of a resistor ( $R_{SAMPLE}$ ) and a capacitor ( $C_{SAMPLE}$ ). In addition, the source resistance ( $R_{SOURCE}$ ) must be taken into account when calculating the required sample and hold time. The figure below shows the ADC input channel equivalent circuit.

Figure 40-3. ADC Input

To achieve  $n$  bits of accuracy, the  $C_{SAMPLE}$  capacitor must be charged at least to a voltage of

$$V_{CSAMPLE} \geq V_{IN} \times (1 - 2^{-(n+1)})$$

The minimum sampling time  $t_{SAMPLEHOLD}$  for a given  $R_{SOURCE}$  can be found using this formula:

$$t_{SAMPLEHOLD} \geq (R_{SAMPLE} + R_{SOURCE}) \times (C_{SAMPLE}) \times (n + 1) \times \ln(2)$$

for a 12 bits accuracy:  $t_{\text{SAMPLEHOLD}} \geq (R_{\text{SAMPLE}} + R_{\text{SOURCE}}) \times (C_{\text{SAMPLE}}) \times 9.02$

where

$$t_{\text{SAMPLEHOLD}} = \frac{1}{2 \times f_{\text{ADC}}}$$

#### 40.7.4. Digital to Analog Converter (DAC) Characteristics

Table 40-13. Operating Conditions<sup>(1)</sup>

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$V_{\text{DDANA}}$	Analog supply voltage		1.62	-	3.63	V
$AV_{\text{REF}}$	External reference voltage		1.0	-	$V_{\text{DDANA}} - 0.6$	V
	Internal reference voltage 1		-	1	-	V
	Internal reference voltage 2		-	$V_{\text{DDANA}}$	-	V
	Linear output voltage range		0.05	-	$V_{\text{DDANA}} - 0.05$	V
	Minimum resistive load		5	-	-	kΩ
	Maximum capacitance load		-	-	100	pF
$I_{\text{DD}}$	DC supply current <sup>(2)</sup>	Voltage pump disabled	-	160	378	μA

Notes: 1. These values are based on specifications otherwise noted.

2. These values are based on characterization. These values are not covered by test limits in production.

Table 40-14. Clock and Timing<sup>(1)</sup>

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
	Conversion rate	$C_{\text{load}}=100\text{pF}$ $R_{\text{load}} > 5\text{kΩ}$	Normal mode	-	-	350
			For $\Delta_{\text{DATA}}=+/-1$	-	-	1000
$t_{\text{STARTUP}}$	Startup time	$V_{\text{DDNA}} > 2.6\text{V}$	-	-	2.85	μs
			$V_{\text{DDNA}} < 2.6\text{V}$	-	-	10

Note: 1. These values are based on simulation. These values are not covered by test limits in production or characterization.

**Table 40-15. Accuracy Characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions		Min.	Typ.	Max.	Units
RES	Input resolution			-	-	10	Bits
INL	Integral non-linearity	$V_{REF} = \text{Ext } 1.0V$	$V_{DD} = 1.6V$	0.75	1.1	2.0	LSB
			$V_{DD} = 3.6V$	0.6	1.2	2.5	
		$V_{REF} = V_{DDANA}$	$V_{DD} = 1.6V$	1.4	2.2	3.5	
			$V_{DD} = 3.6V$	0.9	1.4	1.5	
		$V_{REF} = \text{INT1V}$	$V_{DD} = 1.6V$	0.75	1.3	2.5	
			$V_{DD} = 3.6V$	0.8	1.2	1.5	
DNL	Differential non-linearity	$V_{REF} = \text{Ext } 1.0V$	$V_{DD} = 1.6V$	+/-0.9	+/-1.2	+/-2.0	LSB
			$V_{DD} = 3.6V$	+/-0.9	+/-1.1	+/-1.5	
		$V_{REF} = V_{DDANA}$	$V_{DD} = 1.6V$	+/-1.1	+/-1.7	+/-3.0	
			$V_{DD} = 3.6V$	+/-1.0	+/-1.1	+/-1.6	
		$V_{REF} = \text{INT1V}$	$V_{DD} = 1.6V$	+/-1.1	+/-1.4	+/-2.5	
			$V_{DD} = 3.6V$	+/-1.0	+/-1.5	+/-1.8	
	Gain error	Ext. $V_{REF}$		+/-1.0	+/-5	+/-10	mV
	Offset error	Ext. $V_{REF}$		+/-2	+/-3	+/-8	mV

Note: 1. All values measured using a conversion rate of 350ksps.

#### 40.7.5. Analog Comparator Characteristics

**Table 40-16. Electrical and Timing**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
	Positive input voltage range		0	-	$V_{DDANA}$	V
	Negative input voltage range		0	-	$V_{DDANA}$	
	Offset	Hysteresis = 0, Fast mode	-15	0.0	+15	mV
		Hysteresis = 0, Low power mode	-25	0.0	+25	mV
	Hysteresis	Hysteresis = 1, Fast mode	20	50	80	mV
		Hysteresis = 1, Low power mode	15	40	75	mV
	Propagation delay	Changes for $V_{ACM}=V_{DDANA}/2$ 100mV overdrive, Fast mode	-	60	116	ns
		Changes for $V_{ACM}=V_{DDANA}/2$ 100mV overdrive, Low power mode	-	225	370	ns

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
t <sub>STARTUP</sub>	Startup time	Enable to ready delay Fast mode	-	1	2	μs
		Enable to ready delay Low power mode	-	12	19	μs
V <sub>SCALE</sub>	INL <sup>(3)</sup>		-1.4	0.75	+1.4	LSB
	DNL <sup>(3)</sup>		-0.9	0.25	+0.9	LSB
	Offset Error <sup>(1)(2)</sup>		-0.200	0.260	+0.920	LSB
	Gain Error <sup>(1)(2)</sup>		-0.89	0.215	0.89	LSB

- Notes:
1. According to the standard equation  $V(X)=V_{LSB}*(X+1)$ ;  $V_{LSB}=V_{DDANA}/64$
  2. Data computed with the Best Fit method
  3. Data computed using histogram

#### 40.7.6. Temperature Sensor Characteristics

Table 40-17. Temperature Sensor Characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
	Temperature sensor output voltage	T = 25°C, V <sub>DDANA</sub> = 3.3V	-	0.667	-	V
	Temperature sensor slope		2.3	2.4	2.5	mV/°C
	Variation over V <sub>DDANA</sub> voltage	V <sub>DDANA</sub> = 1.62V to 3.6V	-4	1	6	mV/V
	Temperature sensor accuracy	Using the method described in section 32.9.8.2	-10	-	10	°C

Note: 1. These values are based on characterization. These values are not covered by test limits in production.

## 40.8. NVM Characteristics

Table 40-18. Maximum Operating Frequency

V <sub>DD</sub> range	NVM Wait States	Maximum Operating Frequency	Units
1.62V to 2.7V	0	14	MHz
	1	28	
	2	32	
2.7V to 3.63V	0	20	
	1	32	

Note that on this flash technology, a max number of 4 consecutive write is allowed per row. Once this number is reached, a row erase is mandatory.

**Table 40-19. Flash Endurance and Data Retention**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
Ret <sub>NVM25k</sub>	Retention after up to 25k	Average ambient 55°C	10	50	-	Years
Ret <sub>NVM2.5k</sub>	Retention after up to 2.5k	Average ambient 55°C	20	100	-	Years
Ret <sub>NVM100</sub>	Retention after up to 100	Average ambient 55°C	25	>100	-	Years
Cyc <sub>NVM</sub>	Cycling Endurance <sup>(1)</sup>	-40°C < Ta < 105°C	25k	150k	-	Cycles

Note: 1. An endurance cycle is a write and an erase operation.

**Table 40-20. EEPROM Emulation<sup>(1)</sup> Endurance and Data Retention**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
Ret <sub>EEPROM100k</sub>	Retention after up to 100k	Average ambient 55°C	10	50	-	Years
Ret <sub>EEPROM10k</sub>	Retention after up to 10k	Average ambient 55°C	20	100	-	Years
Cyc <sub>EEPROM</sub>	Cycling Endurance <sup>(2)</sup>	-40°C < Ta < 105°C	100k	600k	-	Cycles

Notes: 1. The EEPROM emulation is a software emulation described in the App note AT03265.

2. An endurance cycle is a write and an erase operation.

**Table 40-21. NVM Characteristics**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
t <sub>FPP</sub>	Page programming time	-	-	-	2.5	ms
t <sub>FRE</sub>	Row erase time	-	-	-	6	ms
t <sub>FCE</sub>	DSU chip erase time (CHIP_ERASE)	-	-	-	240	ms

## 40.9. Oscillators Characteristics

### 40.9.1. Crystal Oscillator (XOSC) Characteristics

#### 40.9.1.1. Digital Clock Characteristics

The following table describes the characteristics for the oscillator when a digital clock is applied on XIN.

**Table 40-22. Digital Clock Characteristics**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
f <sub>CPXIN</sub>	XIN clock frequency		-	-	32	MHz

#### 40.9.1.2. Crystal Oscillator Characteristics

The following table describes the characteristics for the oscillator when a crystal is connected between XIN and XOUT as shown in the figure *Oscillator Connection*. The user must choose a crystal oscillator where the crystal load capacitance C<sub>L</sub> is within the range given in the table. The exact value of C<sub>L</sub> can be

found in the crystal datasheet. The capacitance of the external capacitors ( $C_{LEXT}$ ) can then be computed as follows:

$$C_{LEXT} = 2(C_L - C_{STRAY} - C_{SHUNT})$$

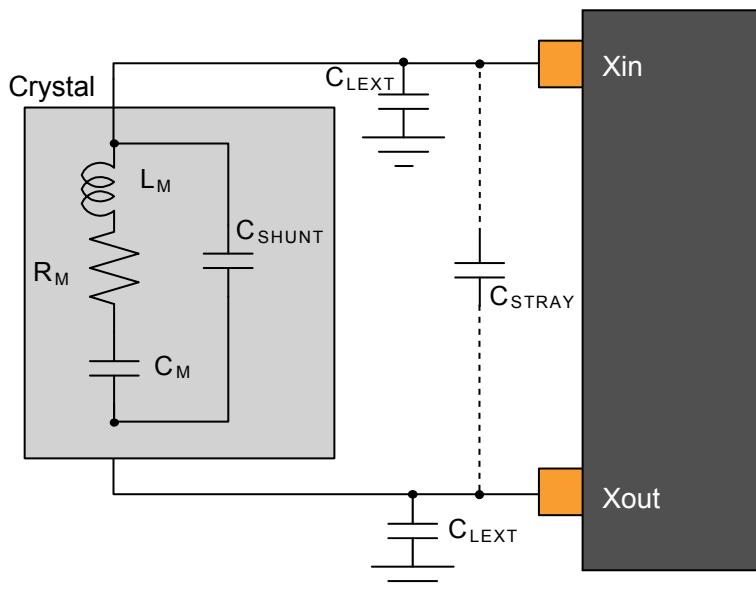

where  $C_{STRAY}$  is the capacitance of the pins and PCB,  $C_{SHUNT}$  is the shunt capacitance of the crystal.

**Table 40-23. Crystal Oscillator Characteristics**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$f_{OUT}$	Crystal oscillator frequency		0.4	-	32	MHz
ESR	Crystal Equivalent Series Resistance Safety Factor = 3  The AGC doesn't have any noticeable impact on these measurements.	$f = 0.455 \text{ MHz}, C_L = 100 \text{ pF}$ XOSC.GAIN = 0	-	-	5.6K	$\Omega$
		$f = 2 \text{ MHz}, C_L = 20 \text{ pF}$ XOSC.GAIN = 0	-	-	416	
		$f = 4 \text{ MHz}, C_L = 20 \text{ pF}$ XOSC.GAIN = 1	-	-	243	
		$f = 8 \text{ MHz}, C_L = 20 \text{ pF}$ XOSC.GAIN = 2	-	-	138	
		$f = 16 \text{ MHz}, C_L = 20 \text{ pF}$ XOSC.GAIN = 3	-	-	66	
		$f = 32 \text{ MHz}, C_L = 18 \text{ pF}$ XOSC.GAIN = 4	-	-	56	
$C_{XIN}$	Parasitic capacitor load		-	5.9	-	pF
$C_{XOUT}$	Parasitic capacitor load		-	3.2	-	pF
	Current Consumption	$f = 2 \text{ MHz}, C_L = 20 \text{ pF}, \text{AGC off}$	27	65	87	$\mu\text{A}$
		$f = 2 \text{ MHz}, C_L = 20 \text{ pF}, \text{AGC on}$	14	52	76	
		$f = 4 \text{ MHz}, C_L = 20 \text{ pF}, \text{AGC off}$	61	117	155	
		$f = 4 \text{ MHz}, C_L = 20 \text{ pF}, \text{AGC on}$	23	74	104	
		$f = 8 \text{ MHz}, C_L = 20 \text{ pF}, \text{AGC off}$	131	226	308	
		$f = 8 \text{ MHz}, C_L = 20 \text{ pF}, \text{AGC on}$	56	128	181	
		$f = 16 \text{ MHz}, C_L = 20 \text{ pF}, \text{AGC off}$	305	502	714	
		$f = 16 \text{ MHz}, C_L = 20 \text{ pF}, \text{AGC on}$	116	307	590	
		$f = 32 \text{ MHz}, C_L = 18 \text{ pF}, \text{AGC off}$	1031	1622	2260	
		$f = 32 \text{ MHz}, C_L = 18 \text{ pF}, \text{AGC on}$	278	615	1280	

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
t <sub>STARTUP</sub>	Startup time	f = 2MHz, C <sub>L</sub> = 20pF, XOSC.GAIN = 0, ESR = 600Ω	-	14K	48K	cycles
		f = 4MHz, C <sub>L</sub> = 20pF, XOSC.GAIN = 1, ESR = 100Ω	-	6800	19.5K	
		f = 8 MHz, C <sub>L</sub> = 20pF, XOSC.GAIN = 2, ESR = 35Ω	-	5550	13K	
		f = 16 MHz, C <sub>L</sub> = 20pF, XOSC.GAIN = 3, ESR = 25Ω	-	6750	14.5K	
		f = 32MHz, C <sub>L</sub> = 18pF, XOSC.GAIN = 4, ESR = 40Ω	-	5.3K	9.6K	

Figure 40-4. Oscillator Connection

#### 40.9.2. External 32 kHz Crystal Oscillator (XOSC32K) Characteristics

##### 40.9.2.1. Digital Clock Characteristics

The following table describes the characteristics for the oscillator when a digital clock is applied on XIN32 pin.

Table 40-24. Digital Clock Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
f <sub>CPXIN32</sub>	XIN32 clock frequency		-	32.768	-	kHz
	XIN32 clock duty cycle		-	50	-	%

##### 40.9.2.2. Crystal Oscillator Characteristics

Figure 33-6 and the equation in [Crystal Oscillator Characteristics](#) also applies to the 32 kHz oscillator connection. The user must choose a crystal oscillator where the crystal load capacitance C<sub>L</sub> is within the range given in the table. The exact value of C<sub>L</sub> can be found in the crystal datasheet.

**Table 40-25. 32kHz Crystal Oscillator Characteristics**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$f_{\text{OUT}}$	Crystal oscillator frequency		-	32768	-	Hz
$t_{\text{STARTUP}}$	Startup time	$\text{ESR}_{\text{XTAL}} = 39.9 \text{ k}\Omega, C_L = 12.5 \text{ pF}$	-	28K	30K	cycles
$C_L$	Crystal load capacitance		-	-	12.5	pF
$C_{\text{SHUNT}}$	Crystal shunt capacitance		-	0.1	-	
$C_{\text{XIN32}}$	Parasitic capacitor load		-	3.1	-	
$C_{\text{XOUT32}}$	Parasitic capacitor load		-	3.3	-	
$I_{\text{XOSC32K}}$	Current consumption	AGC off	-	1.22	2.25	$\mu\text{A}$
		AGC on <sup>(1)</sup>	-	-	-	
ESR	Crystal equivalent series resistance $f=32.768\text{kHz}$ Safety Factor = 3	$C_L=12.5\text{pF}$	-	-	141	k $\Omega$

Note: 1. See revD/revC/revB errata concerning the XOSC32K.

#### 40.9.3. Digital Frequency Locked Loop (DFLL48M) Characteristics

**Table 40-26. DFLL48M Characteristics - Closed Loop Mode<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$f_{\text{OUT}}$	Average Output frequency	$f_{\text{REF}} = 32.768\text{kHz}$	47	48	49	MHz
$f_{\text{REF}}$	Reference frequency		0.732	32.768	35.1	kHz
Jitter	Period jitter	$f_{\text{REF}} = 32.768\text{kHz}$	-	-	0.84	ns
$I_{\text{DFLL}}$	Power consumption on $V_{\text{DDIN}}$	$f_{\text{REF}} = 32.768\text{kHz}$	-	292	-	$\mu\text{A}$
$t_{\text{LOCK}}$	Lock time	$f_{\text{REF}} = 32.768\text{kHz}$ <code>DFLLVAL.COARSE = DFLL48M COARSE CAL</code> <code>DFLLVAL.FINE = 512</code> <code>DFLLCTRL.BPLCKC = 1</code> <code>DFLLCTRL.QLDIS = 0</code> <code>DFLLCTRL.CCDIS = 1</code> <code>DFLLMUL.FSTEP = 10</code>	100	200	500	$\mu\text{s}$
		Quick lock disabled, Chill cycle disabled, $C_{\text{STEP}}=3, F_{\text{STEP}}=1,$ $f_{\text{REF}} = 32.768\text{kHz}$	-	600	-	

Note: 1. See revC/revB errata concerning the DFLL48M.

2. All parts are tested in production to be able to use the DFLL as main CPU clock whether in DFLL closed loop mode with an external OSC reference or in DFLL closed loop mode using the internal OSC8M (Only applicable for revC).

#### 40.9.4. 32.768kHz Internal oscillator (OSC32K) Characteristics

Table 40-27. 32kHz RC Oscillator Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
f <sub>OUT</sub>	Output frequency	Calibrated against a 32.768kHz reference at 25°C, over [-40, +105]C, over [1.62, 3.63]V	28.508	32.768	35.062	kHz
		Calibrated against a 32.768kHz reference at 25°C, at V <sub>DD</sub> =3.3V	32.276	32.768	33.260	
		Calibrated against a 32.768kHz reference at 25°C, over [1.62, 3.63]V	31.457	32.768	34.079	
I <sub>OSC32K</sub>	Current consumption		-	0.67	1.62	µA
t <sub>STARTUP</sub>	Startup time		-	1	2	cycle
Duty	Duty Cycle		-	50	-	%

#### 40.9.5. Ultra Low Power Internal 32kHz RC Oscillator (OSCULP32K) Characteristics

Table 40-28. Ultra Low Power Internal 32kHz RC Oscillator Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
f <sub>OUT</sub>	Output frequency	Calibrated against a 32.768kHz reference at 25°C, over [-40, +105]C, over [1.62, 3.63]V	25.559	32.768	39.016	kHz
		Calibrated against a 32.768kHz reference at 25°C, at V <sub>DD</sub> =3.3V	31.293	32.768	34.570	
		Calibrated against a 32.768kHz reference at 25°C, over [1.62, 3.63]V	31.293	32.768	34.570	
I <sub>OSCULP32K</sub> <sup>(1)(2)</sup>			-	-	180	nA
t <sub>STARTUP</sub>	Startup time		-	10	-	cycles
Duty	Duty Cycle		-	50	-	%

- Notes:
1. These values are based on simulation. These values are not covered by test limits in production or characterization.
  2. This oscillator is always on.

#### 40.9.6. 8MHz RC Oscillator (OSC8M) Characteristics

Table 40-29. Internal 8MHz RC Oscillator Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units
$f_{\text{OUT}}$	Output frequency	ICalibrated against a 8MHz reference at 25°C, over [-40, +105]C, over [1.62, 3.63]V	7.65	8	8.17	MHz
		Calibrated against a 8MHz reference at 25°C, at $V_{\text{DD}}=3.3\text{V}$	7.94	8	8.06	
		Calibrated against a 8MHz reference at 25°C, over [1.62, 3.63]V	7.92	8	8.08	
$I_{\text{OSC8M}}$	Current consumption	IDLEIDLE2 on OSC32K versus IDLE2 on calibrated OSC8M enabled at 8MHz (FRANGE=1, PRESC=0)	-	71	168	$\mu\text{A}$
$t_{\text{STARTUP}}$	Startup time		-	2.1	3	$\mu\text{s}$
Duty	Duty cycle		-	50	-	%
